Duar Bagari and the eastern portion of Duar Salana, in the north-east corner of the district, are drained by the Diphlu, the Gatonga, and its tributary the Deopani. About eight miles north-east of Silghat the Kalang takes off from the Brahmaputra, and after flowing a tortuous course through the centre of the district past Nowgong, Raha, and Jagi, rejoins that river at Kajalimukh about 15 miles above Gauhati. The Kalang receives the drainage of the north western slopes of the Mikir Hills

Other rivers
The Kalang.

in the Misa and Diyu which join it in the upper portion of its course. Further south, the drainage of these hills is collected in the Nanai or Hari, which flows for some distance parallel to the Kalang and finally falls into it at Raha. Here, too, it is connected by a channel with the Kapili, which brings to it the drainage of North Cachar and the eastern slopes of the Jaintia Hills; but the main stream of that river turns to the west, and, after receiving the Barpani and the Umiam or Kiling from the Jaintia and Khasi Hills, falls into the Kalang at Jagi. A little to the west of Jagi, the Kalang forms the boundary between the districts of Kamrup and Nowgong, and not far from its junction with the parent stream receives the Digru on its left bank. The total length of the Kalang is 73 miles, and, by acting as a receiver for the Brahmaputra, it fills a most important place in the drainage system of the district. The current is somewhat sluggish, the bed of the river soft and muddy, and the banks are steep and high. Between Samagurihat and Raha they are covered with a continuous line of villages, and between Raha and Jagi the river flows as a rule between villages or rice fields, but from Jagi to its' mouth it passes through waste and jungle land. During the rains it is navigable throughout its length by a boat of four tons burthen, and small steamers go down it from Silghat as far as Nowgong station. In the dry season the flow of water from the Brahmaputra is stopped by a sand-bank which has formed near Silghat, and above Jagi the river can be crossed on foot, and is thus little used for navigation. During the rains ferries are maintained

at Jagi, Raha, Nowgong and Kuwarital, but at the last three places temporary bridges are erected when the water falls. The country between the Kalang and the Brahmaputra is drained by a large number of *jans* or water courses flowing a tortuous and sluggish course between high banks parallel to the main river. They form a network of intricate channels which here and there widen out into *bils* or swamps, the largest of which are known as the Leteri and Sonai.

The Kapili rises in the Jaintia Hills and enters the **The Kapili.** Nowgong district at Panimur. From here it flows a north north-westerly course till a little below its confluence with the Jamuna, where it takes a turn to the west and flows past Raha. Here it is connected by a branch channel with the Kalang, but it is not till Jagi is reached that it finally falls into that stream after a course of 163 miles. The principal tributaries of the Kapili on the right bank are the Doiang which joins it at Panimur, the Lankajan, and the Jamuna which is swelled by the following streams, the Dimoru, the Dighalpani, the Horgati and the Buriganga. On the left bank the Kapili receives the Kolanga, the Barpani, and the Umiam or Kiling, the two latter being themselves considerable rivers. Just below its junction with the Umiam it is crossed by the railway on a brick bridge no less than 500 yards in length, but this bridge is much in excess of the width of the river, when flowing between its permanent banks. During the rains it is navigable by a boat of four tons burden as far as Panimur, but a vessel of this size could not get much above Kampur in the dry

season. The river is largely used as a trade route, and affords an outlet to mustard grown in the plains, and to cotton, lac, cocoons, and timber from the hills.

Marshes.

Nowgong is dotted all over with *bils* and marshes, many of which have formed in the beds of rivers which have changed their courses. Altogether there are some 57 *bils* or marshes which are sold as public fisheries, and more than one hundred which are used by the villagers for this purpose but are allowed to remain untaxed. These marshes are especially numerous in the *chapari* or low land near the Brahmaputra, but none are of conspicuous size or importance. The largest are, perhaps, the Mora Kalang and the Kachudhara, which have formed in the old bed of the Kalang, the Lalung *bil* in the Namati mauza, the Goukhajua *bil* in Mikirbheta mauza, the Garanga and Pakaria in Mayang mauza, the Udari Khanagaria in Ghugua mauza, and the Haribhanga *bil* near Laokhoa opposite Tezpur. During the cold weather these *bils* are very pleasant places. The water lies in the centre of the depression and is surrounded by a belt of the most luxurious fodder grass, which is again enclosed by a wall of reeds, some ten or twelve feet high. These marshes generally teem with fish, and are the haunt of birds of every kind ranging in size from the crane, pelican, or fish eagle to the snippet and the small blue kingfisher. In the wilder parts of the district the sportsman on breaking through the encircling wall of jungle, may come upon a wild pig rooting for his food, or a herd of buffalo standing knee deep in the rich pasture or wallowing in

the shallow water near the edge ; while sometimes, if the fates are unusually kind, he may find, as the sun is setting, a large rhinoceros taking his evening drink.

Bils that have formed in the beds of rivers that have changed their courses are of a different character. The banks are high, and are often overgrown with trees, and the *bil* is long and narrow and often fairly deep.

The soil of the plain is of alluvial origin and consists **Geology.** of a mixture of clay and sand in varying proportions, ranging from pure sand on the banks of the Brahmaputra to a stiff clay which is quite unfit for cultivation. Little is known about the southern slopes of the Khasi and Jaintia Hills, but they are said to be of gneissic origin. The Mikir Hills were examined by an officer of the Geological Survey Department in the winter of 1896-97. Nearly the whole of the north Mikir Hills are composed of massive gneiss or foliated granite, but to the south there are only two exposures of this rock.* The hills west of Lumding, and between Dimapur and Mohandiju consist of finely bedded grey clay shales, which, north of Lumding, have been covered with sandstone beds. A mottled earthy trap is often found at the junction of the gneiss and the sedimentary rocks, but there is a remarkable absence of trap dykes in the gneissic area. Deposits of limestone are found at Panimur and near the Jamuna river, but are unfortunately somewhat inaccessible and have not yet been worked. Salt is found in the Mikir Hills at Jangthang and there

* The hills lying north of the Daigrung do not seem to have been included in this officer's enquiries.

are traces of petroleum in the neighbourhood of Lumding. Iron ore is also of wide spread occurrence in the southern Mikir Hills. There are great quantities of ferruginous sandstone passing locally into sandy haematite and haematitic conglomerate, but there seem to be few places where it is sufficiently concentrated to make a workable ore. Coal is found, amongst other places, on the Langlei hill and near the mouth of the Diphu river. The latter deposit gives an analysis of 40 per cent. of carbon and is the best coal found, in the Mikir Hills, but the thinness of the seam, coupled with the fact that it is under water during half the year, deprives it of any value. The Langlei seam consists of twelve feet of visible coal, but it is of very poor quality with a low percentage of fixed carbon and a high percentage of ash. It is only twelve miles as the crow flies from Lumding, but is much more inaccessible than this figure would suggest, as the intervening country is covered with dense jungle and broken up with deep watercourses and ravines. For further particulars with regard to the geology of the Mikir Hills reference should be made to *Memoirs of the Geological Survey of India*, vol. xxviii, part 1, pages 71-95.

Climate.

The climate of Nowgong does not differ materially from that of the rest of Assam Proper. From the middle of November till the end of February the weather is all that could be desired. The total rainfall during this period is only about two inches, the sky is clear, the sun though bright has little power, and the air is cool and pleasant. Fogs sometimes hung over

the *chapari* near the Brahmaputra, but even fogs are not an unmitigated evil, as by diminishing the period during which the earth is exposed to the influence of the sun's rays, they help to keep the country cool. In March the temperature begins to rise, but the copious showers of April, when from five to six inches of rain fall, effectually prevent the development of anything in any way resembling the hot weather of Upper India. Between May and September the rainfall is fairly heavy, the air becomes surcharged with moisture, and the damp heat is trying alike to Europeans and to natives. It is seldom that the thermometer rises above 90°. Fahrenheit, but, in an excessively humid atmosphere like that of Nowgong, even such a moderate degree of heat has a relaxing effect upon the constitution. In October, the temperature begins to fall and the nights are fairly cool, but the winter does not actually set in till the middle of November. Table I shows the average monthly rainfall at certain selected stations. Over the greater portion of the plains the average fall is about 75 inches in the year, but in the Kapili valley it is considerably less, and at Lanka it is only 42 inches—a rainfall which is phenomenally low for the Province of Assam.

Nowgong is seldom visited by violent and destructive storms, though an interval of dry weather in the rainy season is often closed by a thunder shower, which is extremely welcome as it at once relieves the oppressiveness of the atmosphere. Hailstorms occasionally do damage, especially to tea gardens, but are very local

storm, floods
and
earthquakes.

in their sphere of action. The harvest is often injured by the floods of the Kapili and the Brahmaputra, and this subject will be discussed at greater length in the section on agriculture. The district, like the rest of Assam, has always been subject to earthquakes and suffered severely in the great visitation of June 12th 1897. The circuit house, court house, and Deputy Commissioner's bungalow were rendered unfit for habitation, parts of the jail wall collapsed, and the metalled road along the side of the Kalang was split up with yawning fissures. Some damage was also done to masonry buildings in the district, but fortunately the loss of life was very small, and only three deaths were actually attributed to the earthquake.

Fauna.

Wild animals are fairly common and include elephants, rhinoceros, bison (*bos gaurus*), buffalo, tigers, leopards, bears, wild pig, and different kinds of deer of which the principal varieties are sambar (*cervus unicolor*), barasingha (*cervus duvauceli*), hog-deer (*cervus porcinus*), and barking deer (*cervulus muntjac*). Elephants are fairly common, especially near the hills, and, when the crops are ripening do much damage unless the numbers of the herds are regularly kept down. For this purpose the district is divided into 6 *mahals* or tracts. The right to hunt in each *mahal* is sold by auction, and the lessee is required to pay a royalty of Rs. 100 on every animal captured. The method usually employed is that known as *mela shikar*. Mahouts mounted on staunch and well trained elephants pursue the herd which generally takes to flight. The chase is of a most

arduous and exciting character. The great animals go crashing through the thickest jungle and over rough and treacherous ground at a surprising pace, and the hunter is liable to be torn by the beautiful but thorny cane brake, or, were he not very agile, to be swept from his seat by the boughs of an overhanging tree. After a time the younger animals begin to flag and lag behind, and it is then that the opportunity of the pursuer comes. Two hunters single out a likely beast, drive their elephants on either side, and deftly throw a noose over its neck. The two ends of the noose are firmly fastened to the *kunkis*, as the hunting elephants are called, and as they close in on either side the captured animal is unable to escape, or to do much injury to his captors, who are generally considerably larger than their victim. The wild elephant is then brought back to camp where it is tied up for a time and gradually tamed. From 80 to 100 *kunkis* are generally employed, only a small proportion of which are the property of the actual *mahaldar*. The arrangement generally made is that the *mahaldar* pays the price of the *mahal*, and that he receives from his partners one fourth of the elephants they capture. The royalty on each elephant is paid by the person who will receive the price when the animal is sold. 38 elephants were caught in 1897-98 the last year in which the *mahals* were sold by the Deputy Commissioner.

Rhinoceros live in the swamps that fringe the Brahmaputra and are now becoming very scarce. They breed slowly, and as the horn is worth more than its

weight in silver, and the flesh is prized as food, they present a tempting mark to the native hunter. Recently 40 square miles of uninhabited jungle land near Laokhoa have been reserved and constituted a sanctuary for game, and a proposal to form a similar reserve of 37 square miles near Dimaru is under consideration. Herds of wild buffalo are also found near the Brahmaputra, and wild bulls often serve the tame cows that are kept by the Nepalese on the river *churs*. Bison are generally found near the hills and in the neighbourhood of tree forest; tigers, leopards, and bears are met with in almost every part of the district. Wild animals cause little loss of human life, but, in 1903, are said to have accounted for over one thousand head of cattle. The number of human beings killed in that year by different animals was as follows—elephant 1, tigers 6, bears 2, wild buffaloes 4, wild pigs 2, snakes 9, total 24. Rewards were at the same time paid for the destruction of 27 tigers, 23 leopards, and 18 bears.

Small game include wild geese and duck, snipe, florican (*sypheotis bengalensis*), black and marsh partridge, pheasants, jungle fowl, and hares.

CHAPTER II. HISTORY.

Summary—The Kingdom of Kamarupa—Visit of Hiuen Tsiang—Jangal Balahu—Nowgong copper plate—The Kachari kingdom—Wars between Ahoms and Kacharis—The Koch Kings—Koch and Muhammadan invasions—The Ahom Kings—The Moamaria insurrection—Annexation of Assam by the British—Ahom Government and social life—Condition of country in 1824—Changes in district boundaries—The Phulaguri riot—Archaeological remains—Chronological Table.

It is doubtful whether at any period the whole of the country which is now known as the district of Nowgong was a separate polity under its own ruler, and its history has to be considered in connection with that of the various states of which from time to time it formed a part. It was originally included in the ancient Hindu kingdom of Kamarupa, which is mentioned in the Mahabharata, and which at one time occupied North Eastern Bengal, and a great part of what is now known as the Province of Assam. About the tenth century A. D. the northern portion of the district seems to have formed part of the territories of a powerful and civilized line of Pala kings. But even at that date Kachari princes were ruling in the Kapili valley, and, though they were conquered by the Ahoms in the sixteenth century, they continued to hold this

Summary.

portion of the district as feudatory chiefs, till it passed into our hands with the rest of Assam in 1826. In the middle of the sixteenth century, the northern part of Nowgong began to pass into the sphere of Ahom influence, though, for a time at any rate, it was overrun by the Koches and Muhammadans, and it was not till about 1685, A. D. that the Ahoms finally expelled the Musalmans from Kamrup, and established their rule over the five upper districts of the Assam Valley.

The king-
dom of
Kamarupa,
1900 B. C.—
1000 A. D.

According to the *Yogini Tantra*, the kingdom of Kamarupa extended from the Karatoya river on the western boundaries of Rangpur to the Dikrai in the east of the Darrang district. It was divided into four portions, *i. e.*, Kamapith from the Karatoya to the Sankosh, Ratnapith from the Sankosh to the Rupahi, Suvarnapith from the Rupahi to the Bhareli, and Saumarapith from the Bhareli to the Dikrai. The earliest king of Kamarupa of whom anything in particular is recorded is Narak, who is said to have been the son of the earth by Vishnu, and who defeated and slew his predecessor Ghatak.* He established his capital at Pragjyotishpura, the modern Gauhati, and seems to have been a powerful and prosperous, though somewhat headstrong prince. He was appointed the guardian of Kamakhya, and his name still lives amongst the people as the builder of the causeway up the southern face of the hill Nilachal, on which the temple of Kamakhya

* An account of the early kings of Kamarupa will be found in the Koch Kings of Kamarupa by Mr. E. A. Gait, C.S., published in J. A. S. B., Vol. LXII, Part I, No. 4, 1893.

stands. His power and presumption were such that he asked Kamakhya to marry him, and the goddess consented, on the understanding that he would construct for her a temple, a road, and a tank in a single night. He was on the point of completing this task, when Kamakhya made a cock crow before the usual hour, and the place about eight miles north of Gauhati,* at which Narak in his rage killed the cock, is still known as Kukurakata (the place where the cock was killed). He was succeeded by his son Bhagadatta, who is mentioned in the Mahabharata as fighting on the side of the Kauravas at the great battle of Kurukshetra, and we thus seem justified in assuming that fully a thousand years before Christ, Nowgong formed part of a powerful kingdom ruled by a line of non-Aryan princes.

Further information with regard to the rulers of Kamarupa is given in certain copper plates, which on palæographical grounds have been assigned to the eleventh century A. D.† These plates are valuable evidence as to the state of the country at the time at which they were engraved, but their account of the genealogy of the reigning king must obviously be received with some degree of caution. The dynasty of Narak is said to have been displaced by Cala Stambha, a Mleccha or foreign conqueror, whose line ended in the person of Sri Harisa, and was succeeded by another family of foreign princes, the first of whom was Pralambha and

* A hill near Silghat is also called Kukurakata for the same cause.

† For a description of these plates see J. A. S. B., Vol. LXVI. pp. 113 and 285, and Vol. LXVII, Part I, No. 1, p. 99.

the last Tyaga Singh. The dynasty of Narak was then restored in the person of Brahmapala. The invasion of the Mlecchas and their subsequent expulsion not improbably corresponds with the great irruption of the Bodos, who, according to their own traditions were at one time ruling at Gauhati and were subsequently driven eastwards to Dimapur, but the whole of this period is involved in great obscurity.

The visit of
Hiuen
Tsiang, 640
A. D.

In 640 A. D. Hiuen Tsiang visited Assam, and the record of his travels affords a momentary glimpse of the conditions of the country, a glimpse which is not unlike the view afforded by a flash of lightning on a dark and stormy night. The landscape, which has been shrouded in impenetrable gloom, is suddenly disclosed to view, and with equal rapidity is engulfed again in the blackest darkness; and nothing definite is known of the fortunes of Assam and its inhabitants, either immediately before or after the visit of the great Chinese traveller. The country seems to have advanced some distance on the path of civilization. The soil was deep and fertile, the towns surrounded by moats, the people fierce in appearance but upright and studious. Hinduism was the national religion, and, though Buddhism was not prohibited, its milder tenets had comparatively few followers.

Jangal
Balahu

A prince whose name is still remembered in Nowgong is Jangal Balahu. His father was the famous Arimatta, the son of a queen of Pratappur who was handed over to the embraces of the Brahmaputra, and who was sent by his mother to live on the south bank of that river.

He became a powerful king, unwittingly slew his putative father, and was in his turn accidentally killed by his son Jangal.* But this is only one of several versions of the story of Arimatta, and even the date at which he lived is most uncertain, one account referring him to the eighth and another to the thirteenth century A. D. Jangal's capital was in the Sahari mauza, about two miles west of Raha, where the remains of considerable earthworks, which are said to have surrounded his palace, are to be seen even at the present day. He was engaged in constant feuds with the Kacharis, by whom he was finally defeated and killed. Several places situated on the Kalang are said to derive their names from incidents in his flight. At Raha he stopped to drink, at Jagi he appeared above the water as he was being carried down by the current, and at Kajalimukh, at the junction of the Kalang and the Brahmaputra, he died, pierced by a *kajali* bamboo.†

Arimatta and Jangal Balahu are but the heroes of popular tradition, and the legends that surround their names are of little historical importance. More light is thrown upon the internal conditions of Nowgong a thousand years ago, by the inscriptions on a copper plate which was dug up on the banks of the Kalang opposite Puranigudam, and which on palæographical grounds has been assigned to the latter end of the tenth

The Now-gong copper plate.

* A fuller account of Arimatta will be found in the Gazetteer of the Darrang district.

† *Vide* an interesting account of the Koch Kings of Kamarupa by Mr. E. A. Gait, c.s., J. A. S. B. Vol. LXII, Part I, No. 4 of 1893.

century A. D.† It records the grant of a piece of land to a Brahman by a king called Balavarman, who lived in the camp of Haruppesvara near the Brahmaputra river. Little is said of the king's capital, and the author of the plate sounds a more modest note than the scribe who on the Bargaon plate recounts the glories of Ratnapala the ruler of Durjaya (probably modern Tezpur.) There are, however, no remains in Nowgong to suggest that it ever at any time contained the capital of a really powerful prince, and possibly Balavarman was only a minor Raja of no great wealth or influence. The inscription on the plate suggests, however, that Nowgong was administered by a well organised and civilized government, much in advance of anything that could be evolved by the aboriginal tribes that at present form so large a proportion of the population, though possibly not superior to the Ahom administration before it was destroyed by rebellion from within and invasion from without. Notification of the grant is issued to "the Brahmans and other castes, headed by the district revenue officials and their clerks," and the easements to which the grantee was entitled are described in full detail. The land was confirmed to him "with its houses, paddy fields, dry land, water, cattle pastures, refuse land, etc." All persons were prohibited from trespass, including "eunuchs, grand ladies, and any other person that may cause trouble on account of the fastening of elephants, the fastening of boats, the searching for thieves,* * * the realising of tenants' taxes

† For a full account of this plate see J. A. S. B., Vol LXVI, Part I, No. 4 p. 285.

and imposts, and the providing of room for the royal umbrella." It is possible that these precise injunctions were merely borrowed from the formulæ employed for grants of this description in the great kingdoms of the west, but if they had any application to the conditions actually existing at the time, it is evident that the Nowgong of the tenth century was very different from the Nowgong from which the British expelled the Burmese in 1825.

The plate is valuable as throwing some light upon the conditions of Nowgong, but it tells us but little of the history of the district. At the time at which it was engraved the Kacharis were in all probability an important power, at any rate in the Kapili valley, and some account must now be given of the origin and development of the Kachari kingdom.

The Kacharis or Bara, (mispronounced Bodo) as they call themselves, belong to the great Bodo tribe, which is found not only in the Brahamaputra Valley, but in the Garo Hills and in Hill Tipperah south of the Surma Valley. It is generally supposed that they are a section of the Indo-Chinese race, whose original habitat was somewhere between the upper waters of the Yang-tse-kiang and the Hoang-ho, and that they gradually spread in successive waves of immigration over the greater part of what is now the Province of Assam. This theory has much to recommend it though, as a matter of fact, apart from the southward movement of the Miris and Chutiyas, most of the tribal migrations of which we have actual knowledge have been from

The Kachari Kingdom.

Origin of Kacharis.

the south towards the north. This was the direction of the Ahom invasion in the thirteenth century, the traditions of the Nagas all represent them as coming from the south, and the northward movement of the Kuki tribes was only stopped by the intervention of the British Government. On the other hand, Mr. Dundas quotes a prayer used by the Dimasa, or Kacharis of the North Cachar Hills, which supports the view that the tribe came from the north-east. It refers to a huge peepul tree growing near the confluence of the Dilao (Brahmaputra) and the Sagi. There the Kacharis were born and increased greatly in numbers, and thence they travelled by land and water till they reached Nilachal, the hill near Gauhati on which the temple of Kamakhya stands. From Gauhati they migrated to Halali and finally settled in Dimapur. It has been already suggested that the Mleccha chief who overthrew the line of Narak may have been the Kachari king, and it is not unlikely that when driven from Gauhati they should have retreated to the valley of the Dhansiri and have established their capital at Dimapur. It was possibly at this time that the race who are somewhat loosely denominated Kachari split up into two sections, and it seems doubtful whether the Kacharis who live on the north bank of the Brahmaputra, were ever in any way connected with the king of Dimapur. The one tribe style themselves Bara, the other Dimasa, and though both use languages of Bodo origin, the difference between plains Kachari and Dimasa is greater than that between French and Spanish. The two tribes sprang no doubt from the same stock, but there

is no evidence to show that the Kacharis of Darrang were ever subjects of the historical Kachari kingdom, or that they are more closely connected with the Kacharis of North Cachar than are the Rabhas and Lalungs, who are also members of the Bodo race. Even in Nowgong there is a marked distinction between the two sections of the tribe. The Kacharis of north Nowgong are Bodos, while those in the south are called Hojai Kacharis and are akin to the Dimasa.

The following legend which is prevalent amongst the Dimasa, would account for the separation of the Bodo and Dimasa, but no traces of the story have been found amongst the Kacharis of Darrang. "Long ago the Dimasa fought against a powerful tribe and were beaten in a pitched battle. They were compelled to give ground but after a time further retreat was barred by a wide and deep river. In despair the king resolved to fight again on the following day, but in the night a god appeared to him and told him that the next morning the army could cross the river if they entered it at a spot where they saw a heron standing on the bank. No one, however, was to look back while the movement was in progress. The dream proved true. A heron was seen standing on the bank and the king and a great portion of his people crossed in safety. A man then turned to see whether his son was following, when the waters suddenly rose and swept away those who were in the river bed and prevented the others from crossing. The Dimasa were those who succeeded in reaching the further bank in safety."

**Kachari
remains in
Kapili
valley.**

At the beginning of the thirteenth century, when the Ahoms first made their appearance in the Assam Valley, the Kacharis seem to have been a powerful tribe occupying the valleys of the Dhansiri and Kapili and ruling over the western portion of Sibsagar and the southern and eastern portions of Nowgong. The remains of their capital at Dimapur * clearly show that they had advanced a considerable distance on the path of civilization. It is now buried in dense tree jungle, and the tract of land lying between the Mikir Hills and the Assam Range, which was formerly part of the Kachari kingdom, is a howling wilderness almost destitute of inhabitants, but it was apparently not so sparsely peopled some centuries ago. The upper portion of the Kapili valley is now the site of a few scattered hamlets of Mikirs and Kacharis, but the ruins of tanks, some of them of considerable size, are to be seen on every side. Even more interesting remains are to be found near the Jurijan, a little to the south of Jamumamukh, in the shape of a fort and three temples built of large blocks of stone and adorned with bas-reliefs and carvings. It must, however, be borne in mind that native rulers often constructed works of considerable size, more for self-glorification than from any idea that they would serve a useful purpose, and it would not be safe to infer that the population was actually as dense as the number and size of the drinking tanks might at first suggest. An army which was sent by Rudra Singh up the Kapili

* Dimapur is situated on the Dhansiri on the western borders of Sibsagar. An account of the ruins will be found in the Gazetteer of that district.

valley in 1706 A.D., seems to have advanced but slowly, and the path had apparently to be cleared through jungle. Five days were consumed in the journey from Jamuna fort to Tetelikhara *chauki*, a distance of six miles, and there is nothing in the Ahom chronicles to suggest that this part of the country was ever densely peopled in the sense in which that term is usually understood in India.

The first collision between the Ahoms and the ^{Wars} Kacharis occurred in 1490 A.D., when the Ahom king ^{between} Suhangpha was defeated and driven across the Dikho. ^{Ahoms and} ~~Kacharis.~~ The fact that the battle was fought in the eastern part of the Sibsagar district, affords some indication of the power of the Kacharis at the end of the fifteenth century and the distance at which they could make their influence felt. Their successes were not, however, of long duration. War soon broke out again, and in 1536 A.D. the Ahoms advanced up the Dhansiri, killed the Kachari king Detsung, and sacked his capital at Dimapur. From this time forward the Kachari princes occupied the position of feudatory chiefs. Their capital was removed first to Maibang in the North Cachar Hills, and afterwards to Khaspur on the southern side of the Barail, and their subsequent history will be found in the Gazetteer of the Cachar district. It is, however, clear that in his tributary capacity the Kachari king held the valley of the Kapili, till it was finally annexed by the British in 1826 A.D. At the beginning of the nineteenth century, during the reign of Kamaleswar Singh, the Kacharis and Moamaris attacked

the Ahoms near Raha, and the Kapili valley even at that time was described as Kachari territory.*

**The Koch
kings. Viswa
Singh, 1500—
1534.**

But, whatever may have been the fate of the Kapili valley, the northern portion of Nowgong came, for a time at any rate, under the Koch kings of Kamarupa. The founder of the Koch kingdom was a Mech named Viswa Singh, who is said to have been the son of Hira, the wife of one Haria Mandal, by Siva, who assumed the shape of her husband, and thus induced her to admit him to her embraces. Viswa Singh subdued the petty princes who surrounded him, founded a magnificent city in Kuch Bihar, and reduced his state to order. He is said to have marched against the Ahoms, but to have abandoned the expedition owing to the collapse of his commissariat; but the Ahom version, which states that he was defeated and made tributary, seems a more probable explanation of the failure of the expedition.

**Nar Narayan.
Jan. 1534—
1584 A. D.**

Viswa Singh died after a reign of 25 years, and was succeeded in 1534 A.D., by his son Malla Deva who assumed the name of Nar Narayan. The reign of this prince represents the zenith of the Koch power, and his armies, which were led by his brother Sukladwaj or Silarai, met with almost unvarying success. He first attacked the Ahoms, but, mindful of his father's failure, commenced his operations by building a great military road along the north bank of the Brahmaputra, and constructing tanks at regular intervals along it.

* The Ahom general was named Haripod Deka Phukan, and his grand children are still alive. As a reward the general was granted an estate of 8,000 *bighas* which is situated in the Mikirbheta mauza.

The work was entrusted to his brother, Gohain Kamala, and the road, much of which is still in existence, bears the name of Gohain Kamala Ali to the present day. Nar Narayan entered the Ahom capital Gargaon (the modern Nazira), and did not leave till he had received the submission of the Ahom king. The Kachari Raja and the Raja of Manipur were then reduced to the position of feudatory chiefs, and the kings of Jaintia, Tippera, and Sylhet conquered and slain. Further successes were obtained over the rulers of Khairam and Dimuria, but the tide of fortune turned when an attack was made on the kingdom of Gaur. The Koch army was routed and Silarai himself made prisoner. Nar Narayan would not, however, accept this defeat as final, and a few years later joined with the Emperor Akbar in a second attack upon the Pasha of Gaur. This enterprise was crowned with success, and Gaur was divided between the Emperor of Delhi and the Koch king. But the power of the Koches declined as rapidly as it had risen, and, at the beginning of the seventeenth century, Nowgong was harried by the wars between the Muhammadans and the Ahoms, who were supporting Bali Narayan the eastern representative of Nar Narayan's line. The story of the Koch kings is told in greater detail in the Darrang Gazetteer, but here it would be out of place as they had little connection with Nowgong, and it is now time to turn to the Ahoms who preceded the British in the sovereignty of the district.

The Ahoms were a Shan tribe from the kingdom of The Ahoms. Pong in the upper valley of the Irawadi, who, at the

beginning of the 13th century, crossed the Patkai and settled in the south of the territory which has since been formed into the districts of Sibsagar and Lakhimpur. The country at the foot of the hills was occupied by tribes of Morans and Borahis, whom they easily subdued, and who were absorbed by inter-marriage with their conquerors. But to the west and north they were confronted by far more powerful nations. Upper Assam was ruled by the Chutiyas, a tribe of Bodo origin, who are believed to have entered the valley from the north-east, and to have conquered the Hindu Pala kings whom they found in possession of the country. On the west there was the strong Kachari kingdom with its capital at Dimapur. In the first half of the fourteenth century the Ahoms became involved in war with the Chutiyas, but their final victory did not come till 1523 A. D., when the Chutiya king was defeated and his country annexed by Suhunmung, the "Dihingia Raja," who reigned from 1497-1539 A. D. The defeat of the Kacharis and the sack of Dimapur in 1536 has already been described in the preceding paragraphs.

**Koch and
Muham-
madan
invasions.**

The Ahoms were now supreme in Upper Assam, but were still exposed to danger from the Koch and Muhammadan powers in the west. In 1532, they defeated with great slaughter a Muhammadan invader named Turbuk on the banks of the Bhareli river, but a few years later they were conquered by the Koch king, Nar Narayan, who occupied their capital Gargaon, the modern Nazira, and exacted tribute from the Ahom prince.

At the beginning of the seventeenth century, they were again involved in war with the Muhammadans, as their king Pratap Singh declined to surrender Bali Narayan, the Koch prince, who had fled to him for protection, and who sagaciously pointed out that in their own interests it was most desirable that they should maintain a buffer state between themselves and the Muhammadans. Most of the fighting took place in Lower Assam, but in 1615 A. D., a Musalman army under Satrajit advanced as far as the Bhareli, to avenge a Muhammadan trader, who had been put to death by the Ahom king. The Muhammadans, though at first successful, were subsequently defeated both on land and water with great slaughter.

The war then dragged on in Lower Assam, but in 1637 A. D., on the death of Bali Narayan, the Bar Nadi, which at present forms the western boundary of Darrang, was fixed as the frontier between Muhammadan and Ahom territory. In 1658, the Ahoms took advantage of the confusion that ensued on the deposition of Shah Jehan to extend their arms to the Sankosh, but three years later they were driven back by Mir Jumla, the Nawab of Dacca, who occupied Gargoon, and there concluded a treaty with the Ahom Raja Sutumla, otherwise known as Jaiyadwaj Singh. The stars in their courses fought, however, on the Ahom side. The rains set in with a severity exceptional even in that rainy land, the country was converted into a swamp, and disease made havoc of the Muhammadans crowded together in their water-logged camp.

An interesting account of this invasion has been given by the Muhammadan historians.* The Assamese occupied a strong fort at Kajali, which was situated near the western mouth of the river Kalang, but on the approach of the enemy, evacuated it without striking a blow in its defence. Another fort was situated at Simlagarh which seems to have been quite close to Kaliabar.† The place is described as very strong and high, and the inhabitants are said to have been as numerous as ants. Two sides of the fort had battlemented walls, and guns were placed without a break along them. In front there was a moat, and pits had been dug and filled with the *panjis* or bamboo spikes which are still so generally used in Assam at the present day. In spite of its strength the fort was taken without much difficulty by the Muhammadans and the garrison fled. A great naval battle then took place in the neighbourhood of Silghat. The Assamese are said to have had seven or eight hundred ships engaged, but they were again defeated and lost half their fleet, each of the captured vessels being armed with a gun. On the conclusion of peace the Muhammadans marched back again down the valley and suffered great privations when crossing the Kajali plain, a feat which it is said had never before been, attempted by any army. The difficulties of their advance must have been immense, if the Nowgong *chapari* was covered at that time with the dense growth of reeds and

* Vide a paper by Professor Blochmann in J. A. S. B., vol. XLI, pt. I, no. I, p. 49, etc.

† The remains of this fort are perhaps to be found in the Kechakatigarh near Misa

elephant grass that are found there at the present day, and there is nothing improbable in the statement of the Muhammadan historian, that for four days the soldiers had to subsist on water. A large number of men were lost in the retreat down the valley, and by 1667 the Ahoms had again established themselves at Gauhati. A few years later this town was retaken by the Muhammadans, but it was captured again by the Ahoms during the reign of Gadadhar Singh (1681-1695) and from that time onward Goalpara remained the frontier outpost of the Muhammadan dominions. Local tradition has it that the district was colonized by this prince who transported families from Upper Assam to Nowgong.

The zenith of the Ahom power was reached in the reign of his successor Rudra Singh (1695—1714). This powerful prince waged successful wars against the Kachari Raja and the king of Jaintia, and his generals brought both of these chiefs captive to the Ahom court. The Ahoms were, however, unable to impose their yoke upon the free and savage highlanders, who rose as one man and butchered the garrisons who had been left in the chain of forts across the Jaintia Hills. Rudra Singh was the first of the Ahom kings to publicly become the disciple of Hindu priests, and after his death the power of the Ahom kingdom began steadily to decline.

His son Sib Singh was a weak prince, much under the influence of his wives, whose name has come down to posterity as excavator of the great tank near which the present station of Sibsagar (Sib's tank) stands.

**Pramatta
Singh,
1744—1751.
Rajeswar
Singh,
1751—1769.**

The reign of his successor Pramatta Singh was uneventful, and, during the incumbency of the next prince Rajeswar Singh, the signs of the decay of the Ahom power became all too clear. The Raja of Manipur was driven from his home and applied to the Ahom king for aid. Orders were issued for the despatch of an expedition, but the nobles, to whom the command was entrusted, excused themselves on various grounds and declined the proffered honour. The army lost its way when endeavouring to cross the Patkai, a large number of men perished, and, though ultimately the Manipur Raja succeeded in regaining his dominions, it does not appear that the assistance of the Ahoms materially contributed towards his success.

**Lakshmi
Singh,
1769—1780
The Moama-
ria insurrec-
tion.**

Lakshmi Singh's reign was signalized by the outbreak of the Moamaria insurrection. The causes of this insurrection are not quite clear. According to the chroniclers, a certain Hathidharia Chungi with one Nahor Kachari came to offer their annual tribute of elephants to the king. The elephant which they tendered to the Borborua was a lean and sorry animal, and, as an expression of his disapproval, he cut off their hair and noses, flogged them, and drove them away. Boiling with indignation at this outrage, Nahor proceeded to the house of a Hari woman, whose daughter he espoused, and from whom he received a set of metal plates, covered with mystical incantations to confound the enemy. He then applied to the Moamaria gosain for help, which was readily afforded him, and the standard of revolt was raised. This is the account given by the Ahom

chroniclers, and it differs to some extent from the story as told by the Moamaria gosain at the present day. According to this authority, the leaders of the rebellion were two Moamarias named Nahor Khora and Ragho Neogay, who, after they had been punished for failing to deliver the elephants required, went for assistance to their gosain. The gosain himself declined to listen to their proposals, but they succeeded in winning over his son Gagini Bardekha, who gave them a weapon consecrated with the magic plates of the Kalpataru. The Kalpataru was a sacred book which Anirudha is said to have obtained from Sankar Deb, though the Ahom chroniclers contemptuously assert that it was the property of a sweeper woman.

From the very first the rebels carried all before them. The royal armies were defeated under circumstances which suggest that men and officers alike were guilty of gross incompetence and cowardice; and Lakshmi Singh was driven from his capital and captured. The insurgents then proceeded to appoint Ramakanta, the son of Nahor Khora, to be their Raja. Marauding parties harried the country on every side, and the misery of the common people was extreme. A report at last gained ground that orders had been issued for the execution of all the former officers of state, and this incited the adherents of the king to make one final effort. The signal for the attack is said to have been given by one of the wives of Lakshmi Singh. Ragho, who was one of the most influential men amongst the Moamarias, had forcibly taken her to wife, and, as he

Success and
subsequent
defeat of
Moamarias.

was bending down at the *bihu* to offer his largess to a dancing boy, she cut him down with a sword. On the death of their leader, the rebel forces were surprised and scattered, and a pitiless vengeance taken that spared neither age nor sex.* The house of the Moamaria mahunt was surrounded, and almost the whole of his family was killed before his eyes, while all the officers appointed by the Moamarias were seized and beaten to death. The wives of the rebel prince were treated with savage cruelty. One of them was flogged to death, while two others had their ears and noses cut off and their eyes put out.

Gaurinath
Singh,
1780-1795.
Moamarias
again victo-
rious.

In 1780, Lakshmi Singh died, and was succeeded by his son Gaurinath, in whose reign the Moamaria insurrection broke out anew, and with increased violence. At first, the king's troops met with some measure of success, and orders were issued outlawing the rebels and authorizing any person to kill any Moamaria he might meet, regardless of time, place, sex, or age. Such orders seem to have been only too well adapted to the temper of the people, and, according to the Ahom chronicler, "the villagers thereupon massacred the Moamarias with their wives and children without mercy." The rebels in their turn were not slow to make reprisals; they plundered the country on every side, and "the burning villages appeared like a wall of fire." The ordinary operations of agriculture were suspended, no harvests could be raised, and famine killed those whom

* The Moamarias say that 790,000 members of their sect were killed, which is no doubt an oriental exaggeration.

the sword had spared. "The price of a katha of rice rose to one gold mohur, and men starved in crowds under the trees forsaking their wives and children." The highest Hindu castes are said to have eaten the flesh of cows, and dogs and jackals were devoured by the common people.

In 1786, the rebels under Bharat Singh inflicted a decisive defeat upon the royal troops, and took Rangpur, the capital, by storm. The king fled to Gauhati, and in his terror left even his wives behind him. His generals remained behind in Upper Assam and carried on the contest with varying success. Troops were despatched to their assistance from Manipur but most of them were ambushed and cut up, and the survivors had no heart to carry on the struggle. The desolation of the country is thus described by the Ahom chronicler. "The Mataks harried the temples and the idols of the gods, and put to death all the sons and daughters of our people. For a great length of time our countrymen had no home, some took shelter in Bengal, some in Burma, some in the Daffa Hills, and others in the fort of the Buragohain who was fighting with the Mataks for years and months together." Bharat Singh ruled at Rangpur for upwards of six years and coins are extant which bear his name; but in 1792 a small British force was sent to the assistance of the Ahom king under the command of Captain Welsh. Gauhati, which had been captured by a mob of Doms under a Bairagi, was re-taken, Krishna Narayan, the rebellious Raja of Mangaldai, was subdued, and in March 1794 Rangpur was re-occupied after a decisive

victory over the insurgents. Captain Welsh was then recalled, but the Ahom king was able to keep his enemies in check by the help of sepoy trained on the English system.

**Kamaleswar
Singh,
1796—1809
A. D.**

A few months after the departure of Captain Welsh, Gaurinath died and was succeeded by Kamaleswar Singh. The country was still in a state of great disorder. The Daffas, not content with harrying the villages on the north bank, crossed the Brahmaputra and attacked the royal troops near Silghat, but were repulsed with considerable loss. Even Europeans were not safe, and a Mr. Raush,* a merchant of Goalpara, who had extended his business operations to Darrang, was robbed and murdered by "naked Bengalis." These freebooters then occupied North Gauhati, but when they attempted to make good their position on the south bank, they were defeated with heavy loss by the royal troops near Pandughat. The Daffas again harried the Darrang district, and even enlisted Bengali sepoy in their service, but were ultimately conquered and dispersed. Victories were also obtained over the Moamaris and the Khamtis at the eastern end of the valley.

**Final col-
lapse of the
Ahom king-
dom.**

In 1809, Kamaleswar Singh was succeeded by his brother Chandra Kanta Singh. The Bor Phukan or viceroy of Gauhati incurred the suspicion of the Buragohain or prime minister and fled to Calcutta and

* This Mr. Raush was the first European to interfere in the affairs of Assam. He sent 700 burkundases to Gaurinath's assistance, but they were cut up to a man. A mass of masonry, the size of a small cottage, covers the remains of Mr. Raush's infant children at Goalpara.

thence to Burma. At the beginning of 1816, a Burmese army crossed the Patkai and reinstated the Bor Phukan; but shortly after their withdrawal Chandra Kanta was deposed, and Purandar Singh appointed in his stead. The banished monarch appealed to the Burmese, who, in 1818, returned with a large force and replaced him on the throne.

They soon, however, made it clear that they intended to retain their hold upon Assam, and in 1820 Chandra Kanta fled to Goalpara, and from British territory began a series of abortive attempts to recover his lost kingdom. The Burmese were guilty of gross atrocities during their occupation of the country, the villages were plundered and burnt, and the people were compelled to seek shelter in the jungle. Such was their terror of the Burmese that it is said that parents would kill a crying child if it could not easily be pacified. Women who fell into their hands were violated with every circumstance of brutality, and the misery of the unfortunate Assamese was extreme. Fifty men were decapitated on the banks of the Kalang river, in revenge for the opposition offered to the Burmese army before Gauhati, and upwards of two hundred persons of both sexes and all ages were imprisoned in a grass and bamboo shed and burned alive. Fortunately for them, causes of quarrel had by this time arisen between the British and the Burmese. In 1824, war was declared by the British Government, and a force was sent up the valley of the Brahmaputra. The Burmese evacuated Gauhati without striking a blow, and such fighting as

there was took place in the districts of Sibsagar and Nowgong. Rangpur was occupied in 1825, and in the following year, by the treaty of Yandaboo, Assam was ceded to the East India Company.

Ahom Administration.
The paik system.

The above is but a brief account of the rise and fall of the Ahoms, but their history is more intimately connected with the Sibsagar district. It now remains to consider what is known of their social institutions, and the conditions under which those subject to them passed their lives.*

The most striking feature in the economy of the Ahom state, and one which, (to judge from their conduct since they came under our rule) must have been extremely repugnant to the people, was the system of enforced compulsory labour. The lower orders were divided up into groups of three or four called *gots*, each individual being styled a *powa paik*. Over every twenty *gots* was placed an officer called *bara*, over every five *baras* a *saikia*, and over every ten *saikias* a *hazarika*. In theory one *paik* from each *got* was always employed on duty with the state, and, while so engaged, was supported by the other members. The Raja and his ministers had thus at their disposal a vast army of labourers to whom they paid no wages, and for whose maintenance they did not even have to make provision. It was this system which enabled the Ahom Rajas to construct the enormous tanks and great embankments,

* This account of the social life and manners and customs of the Ahoms is principally based on old Ahom chronicles, translations of which are to be found in the office of the Superintendent of Ethnography.

which remain to excite the envy of a generation, which has been compelled to import from other parts of India almost all the labour required for the development of the Province and its industries. Many of the works constructed were of undoubted utility, but many, on the other hand, were chiefly intended for the glorification of their designers. Few objects are more worthy of the attention of an enlightened government than the supply of wholesome drinking water to the people. But the huge reservoirs constructed by the Ahom kings, were out of all proportion to the population which could by any possibility have made use of them, while the close proximity in which these enormous tanks are placed is ample evidence that practical utility was not, the object of their construction. On the other hand, embankments which were thrown up along the sides of some of the rivers near the capital, protected land which has become unculturable since they have fallen into disrepair. Embankments of this nature were constructed along the left bank of the Brahmaputra from Silghat to Kajalimukh, along the south bank of the Rupahi, and along the west bank of the Jamuna, and must have proved of the greatest value to the villagers. The duty of providing the various articles required for the use of the king and the nobility was assigned to different groups, which were gradually beginning to assume the form of functional castes. The rapidity with which these groups abandoned their special occupations, as soon as the pressure of necessity was removed, is a clear indication of the reluctance with

which they must have undertaken the duties entrusted to them.*

War

But though the common people seem to have been compelled to supply an unnecessary amount of labour in times of peace, it was when war was declared that their sufferings were most pronounced. Certain clans of *paiks* were called out, and called out, it would seem, in numbers that were in excess of the actual requirements of the case; an error which entails the most disastrous consequences when the campaign is carried on in a country where supplies are scarce and communications difficult.

According to the Ahom chronicler, nearly 40,000 troops were despatched during the reign of Rajeswar Singh to reinstate the Manipuri Raja on the *gadi*. Their guides, however, failed them; they lost their way in the Naga Hills, and about two-thirds of the soldiers perished, the mortality being chiefly due to famine and disease. The military dispositions even of Rudra Singh, one of their greatest princes, suggest a want of due deliberation in design, and a feebleness and lack of method in execution. In his expeditions against the Kachari and Jaintia Rajas, the Ahoms lost 3,243 persons, and the practical results obtained seem to have been insignificant. The descriptions of the campaigns against the Moa-

* The system of enforced labour was no doubt unpopular, but it had much to recommend it. It taxed the people in the one commodity of which they had enough and to spare, i.e. labour. It also developed them on the industrial side, and the material comfort of the Assamese would possibly have been greater at the present day if they had not all of them been allowed to devote themselves exclusively to agriculture.

marias, given by the Ahom chroniclers, clearly show that the generals were often guilty of incompetence and cowardice, while the rank and file do not seem to have fully realized the dangers that beset a defeated army. Conditions such as these must of necessity have been disastrous to the private soldier.

The Muhammadan historians of the invasion of Mir Jumla give, however, a more favourable account of the Ahom military dispositions.* Their resources seem to have been considerable, and, in the course of the expedition, the Muhammadans captured 675 guns, one of which threw a ball three "mans" in weight, besides a large number of matchlocks and other field pieces. No less than 1,000 ships were taken, many of which could accommodate three or four score sailors; and in the naval engagement which took place above Silghat in March 1662 A.D., the Assamese are said to have brought seven or eight hundred ships into action. The Ahoms are described as strongly built, quarrelsome, blood-thirsty, and courageous, but at the same time merciless, mean, and treacherous. They were more than equal to the Muhammadans in a foot encounter, but were much afraid of cavalry. This *corps d'elite* did not, however, exceed some 20,000 men, and the ordinary villagers, who were pressed into the service, were ready to fling away their arms and take to flight at the slightest provocation.

Another factor, which cannot but have re-acted unfavourably upon the common people, was the uncertainty

Muhamma-
dans des-
cribe Ahoms
as brave
soldiers.

Uncertainty
and arbitra-
ry character
of Govern-

* An interesting account of this invasion will be found in the Journal of the Asiatic Society of Bengal, Volume XLI, Part 1, pages 49-100.

of tenure, under which both the ministers and king held office. A perusal of the Ahom chronicles leaves the reader with the impression that the ministers were continually being deprived of their portfolios, and not unfrequently of life itself. Hardly less precarious was the position of the king, and in the short space of 33 years, between 1648 and 1681, no less than two monarchs were deposed, and seven came to a violent end. Good government, as we understand the term, must have been impossible under such conditions, and we may be sure that the people suffered from this constant change of rulers. Buchanan Hamilton, writing at the beginning of the nineteenth century, states that the administration of justice under Ahom rule was fairly liberal. Important trials were conducted in open court, the opinion of assessors was consulted, the evidence was recorded, and capital punishment was only inflicted under a written warrant from the king. It is true, no doubt, that few persons possessed the power of imposing the death sentence. But they were allowed to inflict punishments which the victim could hardly be expected to survive, and his position was not unlike that of the heretic delivered by the inquisition to the civil arm, with the request that "blood may not be shed."

Instances
of this.

Abundant evidence is available in the Ahom chronicles to show the arbitrary way in which the royal authority was exercised. The following instances are quoted from the reign of Pratap Singh, 1611—1649 A.D. A Katak, or envoy charged with diplomatic relations with foreign powers, asked the Muhammadan commander

on his frontier to supply him with two jars. His conduct was reported to the king, who immediately ordered him to be put to death. Another Katakai reported that he had heard from a down-country man that a Muhammadan force was advancing up the valley. The king enquired of the Katakai responsible for watching the movements of the enemy, whether this information was correct. This man declared that he was unable to obtain any confirmation of the rumour, whereupon the first Katakai was executed for presuming to meddle in matters with which he had no concern—a proceeding which seems to have been hardly calculated to ensure the supply of timely and accurate information. Three merchants then endeavoured to establish friendly relations between the Nawab of Dacca and the Ahom king. The latter prince took umbrage at such unwarrantable interference in affairs of state, and ordered the merchants to be put to death. It subsequently appeared that the facts had not been correctly represented, and the Bor Phukan and two other men responsible were promptly killed. A few years later, the king transported a large number of persons from the north to the south bank of the Brahmaputra, warning them that any one who attempted to re-visit his former home would suffer the penalty of death with all his family “even to the child in the womb.” Five hundred men attempted to return as they wished, the chronicler informs us, to rear a brood of silkworms. The king had them arrested, and 300 were put to death, the remainder escaping in the darkness of the night.

Savage punishments:
an official
blinded for
not dismount-
ing before
his official
superior.

The following incident that occurred in the reign of Lakshmi Singh (1769—1780) is typical of the uncertainties of the time. One Ramnath Bhorali Borua, an officer of state, had the presumption to appear mounted in the presence of his official superior the Borborua. A complaint was promptly laid before the king, who directed that both Ramnath and his brother should be deprived of sight. The injured man was not, however, destitute of friends, and came with his complaint to the Kalita Phukan, who had his private reasons for desiring the downfall of the Borborua. The Phukan went to the king, poisoned his mind against his minister with the suggestion that a conspiracy was on foot, a suggestion which in those days must always have seemed plausible enough, and, in a short time, the heads of the haughty Borborua, his two uncles and his brother, were rolling in the dust. It is needless to multiply instances of the savage violence of the times, but the different forms of punishment in vogue call for some remark. Where life was spared, the ears, nose, and hair were cut off, the eyes put out, or the knee pans torn from the legs, the last named penalty generally proving fatal. Persons sentenced to death were hung, impaled, hewn in pieces, crushed between two wooden cylinders like sugarcane in a mill, sawn asunder, burnt alive, fried in oil, or, if the element of indignity was desired, shorn of their hands and feet and placed in holes, which were then utilized as latrines.

In the seventeenth century, it was no uncommon thing to compel conspirators to eat their own flesh, and more

than one case is quoted, in which the father was forced to eat the liver of his son, a meal that was usually his last in this world. Punishment too was not restricted to the actual offender, but his wretched wife was liable to be handed over to the embraces of a Hari. Methods such as these could hardly fail to have a terrifying effect on much more hardened criminals than the Assamese.

The Ahoms, even after they became a powerful nation, Social life amongst the Ahoms seem to have adhered to a simple style of life, in which there was little of extravagance or luxury. They have left few masonry memorials of their rule; the Raja's palace is almost invariably referred to as "a planked house," and, according to Buchanan Hamilton, the king alone was allowed to erect an edifice of brick. Shoes might not be worn except by the special license of the king, bedsteads and curtains were only to be found in the houses of the rich, and all but the most important visitors to a noble's house sat on the bare ground. The account given of the Raja's palace at Gargaon by the historian of Mir Jumla's invasion is pitched in a more exalted key. Twelve thousand workmen had been engaged on its construction for a year, and the audience hall was 120 cubits long by 30 wide. "The ornaments and curiosities with which the whole woodwork of the house was filled defy all description: nowhere in the whole inhabited world would you find a house equal to it in strength, ornamentation, and pictures." The absence of all reference to these wonders in the Ahom histories suggests, however, than the Muhammadans were anxious to magnify the power and majesty of the prince they had subdued.

The native chroniclers are naturally most concerned with the wars and religious festivals, which bulked so largely in the eyes of the historians of the day, and with the rise and fall of successive families of ministers. It is only incidentally that light is thrown on the social conditions of the people. The kings seem to have indulged in frequent tours about their territories, the itinerary usually followed being Rangpur, Sonarinagar, Tengabari, Dergaon, Jaliarang, Bornagar, Bishnath, and Kaliabar. They were fond of fishing and shooting, and fully appreciated the excitement to be obtained from the hunting of wild elephants. On the occasion of coronations and royal weddings, a week was generally devoted to the festivities, which seem, however, to have consisted for the most part of prolonged feasts, accompanied by much unmelodious music. Towards the end of the eighteenth century, acrobats and jugglers were imported from Bengal, who amused their royal patrons with tricks which are still shown to the tourist on the P. & O. Kamaleswar Singh visited in state the two principal *sattras* of Auniati and Dakhinpat, and was entertained with all his retinue by the gosains. The chronicler quaintly tells us that the lunch at Dakhinpat gave greater satisfaction than the one at Auniati; but does not say whether this was due to the superior skill of the Dakhinpatia cook, or to the greater beauty of the *sattras* precincts.

Attitude of
Ahoms to-
wards Hin-
duism. Sa-
vage perse-
cution of
Vaishna-
vism.

The first Hindus to influence the Ahom kings were Saktists, and Pratap Singh (1611—1649) persecuted the Vaishnavites, one of whose leaders had converted his son

to Hinduism. The disciples of the gosains were seized, human ordure was placed on their foreheads, and they were degraded to the sweeper caste. To be found in the possession of religious books meant death, not only to the actual owner, but to every member of his family. Even Pratap Singh's spiritual pastors were not spared, and he denounced the new religion which, in spite of the adherence of the Raja, had not been able to save from death his own beloved son. He then assembled 700 Brahmans, ostensibly to perform a festival, and, as a punishment for their incompetency, degraded them to the status of *paiks*. These persecutions were continued by Gadadhar Singh, who, in 1692, plundered the treasure houses of the Vaishnavite gosains, and cast the idols into the water. No respect was shown even to the sacred head of the Auniati *sattrā*, and he was driven from his home to Tejikhāt. He fared, however, better than the gosain of Dakhinpat, who had his eyes put out and his nose cut off while many Hindu priests were put to death. A policy of extermination seems in fact to have been inaugurated, and, according to one chronicler, orders were issued for the destruction of every Hindu child regardless of sex and age. The king had large quantities of pork, beef, and fowls, cooked by men of the Dom caste, and compelled Kewats, Koches, Doms, and Haris to partake of their unholy food.

This policy of oppression was reversed during the reign of Rudra Singh, his son, who was publicly admitted as a disciple of the Auniati gosain; and, from this time forward, the influence of the priests seems to have increased.

During the Moamaria insurrection the religious orders again fell upon evil times. The rebel king confined the persons of the four principal gosains, and extorted Rs. 8,000 each from Auniati and Dakhinpat, and Rs. 4,000 each from Garamur and Kamalabari. Religion was degraded by the promulgation of an order that any person could be initiated on payment of a betel nut, and the common people availed themselves in crowds of this indulgence. Subsequently in the reign of Gaurinath Singh the Moamaras attacked the Garamur *sattrā*, burned it to the ground, slew a large number of the disciples and nearly killed the gosain himself. His successor, Kamaleswar Singh, (1795-1809) found himself unable to pay the sepoys whose services were indispensable for the maintenance of some sort of order in the kingdom. Following the example of other monarchs, he called upon the church to supply the funds for the support of the temporal power. Contributions were levied on all the mahunts and the demands of the soldiers were satisfied.

Laxity of
Ahom Hinduism.

But, though converted to Hinduism, the Ahoms found the restrictions of their new religion irksome; and their gosains, with the tact which they display towards their converts of the present day, allowed their new disciples a considerable degree of latitude. Rudra Singh, though he had been publicly admitted to the church by the Auniati gosain, feasted his followers on buffaloes and pigs on the occasion of his father's funeral; while not only buffaloes but even cows found a place in the menu of his coronation banquet. At the time of the first

Moamaria insurrection, the rebel chief made overtures to Lakshmi Singh, and offered him, apparently in good faith, a pig for supper. A present such as this clearly shows that even towards the end of the eighteenth century, the Hinduism of the Ahom kings was one of the most liberal variants of that catholic creed. Before taking any decisive step, it was the practice to refer, not only to the Brahmans and Ganaks, but also to the old Ahom priests the Deodhais and Bailongs. These venerable men were required to consult the omens, by studying the way in which a dying fowl crossed its legs—a system of divination which is in vogue amongst many of the hill tribes of Assam to the present day. The restrictions of caste were evidently somewhat lax, as we hear that the Moamaria mahunt had an intrigue with a Hari woman ; while at the beginning of the nineteenth century, the viceroy of Gauhati took a fisher girl for his mistress, a breach of the covenances for which, it should be added, he was deposed.

The influence of the Muhammadans in Assam Proper was so slight that the low view they professed to take of the other sex had little or no effect upon the general population. The Ahoms, like their Burmese ancestors, held their women folk in honour, and, even at the present day, the purdah and all that it implies, is almost unknown in the country inhabited by the Assamese. The Ahom princesses seem to have taken a prominent part on ceremonial occasions, and not unfrequently exercised considerable influence on affairs of state. In the middle of the seventeenth century, two of the queens

The position of women.

almost usurped the reins of government, and, according to the Ahom chronicler, "their words were law." When called to account by the successor of their husband, they proudly stated that they had been of great service to the king, at a time when he was ignorant of the way in which he should behave, whether when "eating, drinking, sitting, sleeping, or at council." Sib Singh (1714—1744) is said to have abdicated in favour of his queens, hoping thereby to defeat a prophecy which declared that he would be deposed; and coins have been found bearing the names of four of these princesses. The mother of Lakshmi Singh dug a tank, and Gaurinath entrusted to his stepmother the control of the Khangiamel, and consulted with his mother about affairs of state. It was not, however, only the princesses of royal blood who concerned themselves with public matters. At the time of the Moamaria insurrection, one Luki Rani was sent against the rebels; and the victory over Turbuk in 1532 is partly ascribed to the courageous action of the widow of the Buragohain, who had been killed in a previous engagement by the Muhammadans. Desperate at the loss of her husband, she put on armour and rode into the ranks of the enemy to avenge his death. No mercy was shown her and she fell, pierced with spears; but her example emboldened the Ahoms, who at once advanced to the attack and defeated the Musalmans with great slaughter.

**Condition of
Province at
time of
cession to
the British.**

In estimating the effects of British rule, it is necessary to form a clear idea of the state of the Province at the time when it passed into our possession, and first it must

be pointed out that the British did not conquer Assam in the sense in which that word is usually employed. The native system of government had completely broken down, the valley was in the hands of cruel and barbarous foreigners, and it was not as conquerors but as protectors and avengers that the English came. They were certainly not inspired by any lust for land. For some time after the expulsion of the Burmese, the East India Company were doubtful whether they would retain their latest acquisition, and an attempt was made to administer the upper portion of the valley through a descendant of the Ahom kings.

The condition in which we found the country was lamentable in the extreme. For fully fifty years, the Province had been given over to desolation and anarchy. Life, property, honour were no longer safe, and the people in their misery had even abandoned the cultivation of the soil, on which they depended for their very livelihood. Bands of pirates used to raid up the valleys of the Dhansiri and Kakadanga, and return with their boats laden with booty, leaving ruin, death, and desolation in their wake. The hill tribes were no longer kept in order, and the Daflas descended and harried the submontane tracts, and even extended their depredations to the south of the Brahmaputra. The treatment meted out to the unfortunate villagers, can be judged from the protest made by the hillmen to Rajeswar Singh, shortly before the collapse of the Ahom Government, when they begged him "not to pull out the bones from the mouth of dogs." Buchanan Hamilton, writing in

1809 A. D., states that north of the Brahmaputra "there is no form of justice. Each power sends a force which takes as much as possible from the cultivator."

Native testimony on this point.

The memories of this miserable time survived long after it had passed away. In 1853, an Assamese gentleman, Srijut Ananda Ram Dhekial Phukan, wrote as follows to Mr. Moffatt Mills :—"Our countrymen hailed the day on which British supremacy was proclaimed in the Province of Assam, and entertained sanguine expectations of peace and happiness from the rule of Britain. For several years antecedent to the annexation, the Province groaned under the oppression and lawless tyranny of the Burmese, whose barbarous and inhuman policy depopulated the country, and destroyed more than one half of the population, which had already been thinned by intestine commotions and repeated civil wars. We cannot but acknowledge, with feelings of gratitude, that the expectations which the Assamese had formed of the happy and beneficial results of the Government of England, have, in a great measure, been fulfilled; and the people of Assam have now acquired a degree of confidence in the safety of their lives and property, which they never had the happiness of feeling for ages past."

Whatever errors have been committed by the British Government, and it is too much to hope that no mistakes of policy have been made during an administration of nearly eighty years, there can be no question that the introduction of a settled form of government has been of the greatest benefit to the immense mass of the people to whom it has been extended.

On passing into our hands Nowgong was first administered with Kamrup and Darrang as the Lower Assam division, but in 1833, it was formed into a separate district. The head-quarters were established at Puranigudam, but it was found that there was not enough high land there for a civil station, and in 1835 they were transferred to Rangagara. This place proved to be unhealthy and was not sufficiently central, and in 1839 the Magistrate's Court was moved to Nowgong, where it has since remained. The boundaries of the district have also undergone considerable change. The Dhansiri was originally selected as the eastern frontier, and Nowgong included the country inhabited by the Mikirs and a considerable portion of the North Cachar and Naga Hills. In 1853, North Cachar was formed into a separate subdivision, and in the following year Tula Ram's* territory was added to this charge. In 1867, the Naga Hills and a large part of the Mikir Hills were erected into a separate district, the subdivision of North Cachar was abolished, and a considerable portion of the territory of which it was composed was placed under the management of the Deputy Commissioner of Cachar. In 1898, a large part of the Mikir Hills was retransferred to Nowgong and the district took its present form.

Few events of historical interest have occurred in Nowgong during the time that it has been administered as a British district. In 1835, the revenue amounted

* For an account of Tula Ram and his small principality, see District Gazetteer of Cachar.

to Rs. 60,475 and the expenditure to Rs. 35,622. Ten years later the revenue had risen to Rs. 131,000, but then ensued a period of complete stagnation, and in 1853 it was less than it was in 1845. The causes of this stagnation were said to be "frequent high inundations, repeated visitations of cholera and small pox carrying off thousands, and the licentious habits of the people." The term "licentious habits" apparently refers to the use of opium, this being a drug to which the inhabitants of Nowgong have always been addicted, as the people could hardly be described as licentious in the sense in which that word is usually employed. The appalling results of *kala-azar* are described in the following chapter, but it is significant to find that the local officers even in the fifties were far from hopeful with regard to the future of the Assamese. In 1854, Major Butler wrote as follows. "In no district in Assam are the people in more prosperous circumstances than in Nowgong. Rice, their common food, is cheap and abundant; numerous rivers and lakes afford a plentiful supply of fish; their gardens furnish vegetables and fruit; and the climate rendering but little clothing necessary, with a trifling revenue to pay, they have every reason to be satisfied and contented; and I believe they are grateful for the protection of the British Government. With all these advantages, however, they are a licentious and degraded race and appear degenerating rapidly. Numbers of children die annually and the period of their existence seems diminishing. Few adults attain old age, and we almost despair of

population increasing or of their condition being ameliorated by education or the acquirement of more industrial habits." *

The attachment of the aboriginal tribes to opium led to a serious riot at Phulaguri in 1861, when the cultivation of the poppy was prohibited. *Mels* or village assemblies were held day after day to discuss the new and most obnoxious orders, and were attended by large numbers of the people. The police endeavoured to disperse these meetings, and arrest the ringleaders, but found themselves powerless in the presence of such vastly superior numbers; and on December 18th Lieutenant Singer, the Assistant Commissioner, was sent from Nowgong to enquire into the matter. This unfortunate young officer called upon the villagers to disperse, and, when they failed to do so, ordered the police to deprive them of their clubs. One of the constables was assaulted as he was endeavouring to carry out this order and Lieutenant Singer, when coming to his assistance, was felled to the ground by a blow from a thick bamboo. He was deserted by the police, who incontinently fled, though the firing of a single musket was subsequently enough to make the crowd fall back, and was afterwards cruelly murdered at the instigation of one of the ringleaders who said "the saheb did not come to redress our grievances but to put us in bonds; he is still alive, kill him." The Deputy Commissioner on receiving news of the

The Phulaguri riot.

* Travels and adventures in the Province of Assam by Major John Butler; London, Smith Elder and Company, 1855, p. 245.

murder sent out a few men from the detachment of twenty-four sepoy of the 2nd Assam Light Infantry who were stationed in Nowgong, but remained behind himself to protect the treasury. An application was despatched to Tezpur for re-inforcements, and Colonel Hopkinson, who happened to be there, ordered across fifty sepoy, and then proceeded by steamer to Gauhati to bring up eighty more, some of whom were landed at Tezpur. No further opposition was encountered and the Deputy Commissioner proceeded to Phulaguri and held a judicial investigation into the causes of the riot.

The whole occurrence seems to have been mismanaged, and to have been viewed by the local authorities with unnecessary alarm. The people had been irritated by the prohibition of poppy cultivation, and there were rumours of a tax on incomes and *pan*. Rightly or wrongly the villagers had formed the idea that they could not get a hearing from the Deputy Commissioner, and prior to Lieutenant Singer's death the mistake was made of attempting to coerce a dangerous crowd with an insufficient force. After that lamentable occurrence the authorities seem to have overestimated the gravity of the occasion, and the Commissioner describes the force of 50 sepoy marching from Laokhoa to Nowgong as protected on either flank by an impassable morass, as though they could not have easily beaten off any attack that might have been made on them by villagers armed with nothing better than bamboo clubs.

The subsequent history of Nowgong has been very uneventful, and there is no district in Assam which has been and still is so much cut off from the outside world and the hurried march of progress. The principal event of recent years has been the quiet but steady extermination of the people from *kala azar*, but this is a matter for which reference should be made to the following chapter.

The district possesses very few remains which are Archæological remains. of any interest to the archæologist. The temple at Kamakhya near Silghat dates from 1745, A.D. and is built of stone and brick in the usual Ahom style. On the Jugijan, in the Kapili valley, there are the ruins of a fort and of three stone temples, two of which were of considerable size and were dedicated to Siva. These temples were built of large blocks of stone ornamented with carvings and bas-reliefs. The appearance of the ruins would suggest that they were overthrown by an earthquake, but nothing definite is known about them. Reference has been already made to the remains of Jangal Balahu's fort near Raha, and there is another rampart of a similar character near the Rangara inspection bungalow in the Samaguri tahsil. On the Chapanalla hill in Chalchali mauza there are the remains of some stone temples and old fortifications, and there is a fine tank with brick lined sides near Jiajuri. A list of temples and of other sacred places will be found in the next chapter.

CHRONOLOGICAL TABLE.

AHOM KINGS.		MUHAMMADAN INVASIONS.	
A. D.		A. D.	
1228	Sukapha.	1204	Baktiar Khilji invades Assam.
1268	Sutenpha.	1220	Ghiyas-ud-din-Bahadur Shah advances to Sadiya, but is defeated.
1281	Subinpha.	1256	Iktiyarud-din Yusbak Tughril Khan invades the Brahmaputra Valley but is ultimately defeated.
1293	Sukangpha.	1337	Muhammed Shah sends a force "of 100,000 horsemen" into Assam, all of whom perish.
1332	Sukampha.		
1364	Sutupha-treacherously killed by Chutiyas at a regatta held on the Safrai river to celebrate a cessation of hostilities between the two tribes.		
1376-1380	Interregnum.		
1380	Sukemthi, a weak and tyrannical prince, assassinated by his ministers.		
1389-1398	Interregnum.		
1398	Sudangpha.		
1407	Siyangpha.		
1422	Suphukpha.		
1439	Susingpha-defeats Nagas.		
1488	Suhangpha-defeated by Kacharis in 1490, and murdered by a convict.		
1493	Supimpha, a cruel prince assassinated by his ministers.		
1497	Suhunmung, alias Sarga Narayan or Dihingia Raja. Conquers Chutiyas and annexes their kingdom 1523. Repulses two Muhammadan invasions, the second being that under Turbuk in 1532, who was routed near the Bhareli river. Kills Kachari king and sacks Dimapur his capital in 1536. Assassinated 1539.		
1539	Sukhenmung-built Gargaon(Nazira).		
1552	Sukampha.		
1611	Suchengpha or Pratap Singh. Assists Bali Narayan against Mussalmans, besieges Hajo, but is driven back. Bar Nadi accepted as frontier between Muhammadans and Ahoms in 1637.		
1649	Surumpha. Deposed.		
1652	Suchingpha. Deposed.		
1654	Sutumla or Jaiyadwaj Singh. Ahoms occupy Goalpara, 1658. Driven back by Mir Jumla, who enters Gargaon, 1661.		
1663	Chakradwaj. Ahoms reoccupy Gauhati in 1667.		
			KOCH KINGS.
		1509-1534	Viswa Singh—Founds Koch kingdom, advances against Ahoms but was apparently defeated.
		1534-1564	Nar Narayan-conquers Ahoms and occupies Gargaon circa 1563 A. D. Subdues Rajas of Cachar, Jaintia, Manipur, Tipperah and Sylhet, Kala Pahar invades Assam in 1553 and destroys temples at Kamakhya and Hajo.
		1531-1593	Raghu Rai obtains share of Koch kingdom east of Sankosh.
		1593-1614	Parikshit-builds North Gauhati, quarrels with his cousin Lakshmi Narayan, calls in Muhammadans to his aid.
		1614-1637	Bali Narayan—Invokes aid of Ahoms against Muhammadans. From this date the Koch kings cease to be of any political importance.

CHRONOLOGICAL TABLE.—*Concluded.***AHOM KINGS.**

A. D.	
1670	Adayaditya Singh, assassinated.
1673	Suklumppha-poisoned. Musalmans reoccupy Gauhati.
1674	Suhung-assassinated.
1674	Teenkungiya-assassinated.
1674	Suhungpha-blinded and murdered.
1677	Sudinpha-assassinated.
1679	Sulekpha (Lora Raja) assassinated.
1681	Gadadhar Singh—Ahoms recover possession of Gauhati.
1695	Budra Singh—founds Rangpur, defeats Kachari and Jaintia Rajas, publicly adopts Hinduism as his religion. This period represents the height of the Ahom power. Dies at Gauhati.
1714	Sib Singh—a weak prince who resigned in favour of his wives. Excavated tank at Sibsagar.
1744	Framatta Singh.
1751	Rajeswar Singh. Decline of Ahom power.
1769	Lakshmi Singh. Out-break of Moamaria rebellion—king deposed for a time, but subsequently reinstated.
1780	Gaurinath Singh. Driven to Gauhati by Moamaras. Reinstated by Captain Welsh in 1792, who is, however, recalled in 1794. Krishna Narayan, Darrang Raja, asserts his independence in 1792, but is defeated by Captain Welsh.
1795	Kamaleswar Singh. Deposes Krishna Narayan.
1809	Chandra Kanta Singh—Burmese are invited into Assam by Bor Phukan. Deposed 1816.
1816	Purandar Singh—Burmese again enter Assam. Deposed 1818.
1818	Chandra Kanta Singh—Burmese decline to leave—Chandra Kanta driven from Assam in 1820.
1824	War declared between British and Burmese Governments.
1825	Rangpur taken.
1826	Treaty of Yandaboo by which Assam was ceded to the East India Company.

CHAPTER III.

THE PEOPLE.

Area and density—Town and villages—Variation in population—Immigration—Sex and marriage—Infirmities—Language—Caste and tribes—Religions—Occupations—Marriage customs—Amusements and festivals—The Bihus—Gosains—*Sattras*—Temples.

Area and density.

The district covers an area of 3,843 square miles and is extremely sparsely peopled, there being on the average only 68 persons to the square mile. There are however, marked variations from this mean and in spite of the ravages of *kala azar*, there are still considerable areas in Nowgong which support a moderately dense rural population. Mr. Mills thus describes his voyage up the Kalang in 1853.* “The villages are situated on the banks, and the scenery from the steamer was, after the immense tracts of jungle I had seen unvaried by the sight of a village, most gratifying, it was of densely populated villages with good gardens and rich cultivation. There is perhaps no part of Assam more populous and prosperous.”

The banks of the Kalang between Nowgong and Kaliabar are still lined with villages, and in the Nowgong tahsil there was a density of 386 to the square mile in 1901. Hatichong and Kachamari, two mauzas which

* Report on the Province of Assam by A. J. Moffatt Mills. Calcutta, 1854.

lie west of the Kalang opposite Nowgong town, had a density of 303 over an area of 50 square miles ; in the Samaguri tahsil there were 212 people to the square mile ; and in the Chutial and Barbhagia mauzas immediately to the north 322. There is in fact a belt of fairly populous country on either side of the Kalang from Kaliabar to Jagi. On the other hand the mauzas which fringe the Brahmaputra are inundated in the rains and can only support a very scanty population. Juria, for instance, had a density of only 21 over 124 square miles, and Mayang and Gerua Bokani were little better. It is, however, the hills mauzas and the upper valleys of the Kapili, the Jamuna, the Dhansiri and the Langpher, which bring down the average of the district to its unusually low level, for here over a total area of 2,070 square miles there was in 1901 an average population of only 21 to the square mile.* There is of course abundance of good culturable land which is still awaiting settlement in Nowgong, but the district is not so absurdly underpeopled as the figures of density would at first suggest. There is room no doubt for an enormous increase in the population, but there are hundred of square miles included in the *chapari mahals*, the hills, and probably a considerable portion of the Kapili valley, which would never be able to support a really dense agricultural population. The density of each mauza and the decrease in population between 1891 and 1901 will be found in Table II

* The mauzas in question are :—Duars—Salana, Bamuni, Kathiatali Dikharu and Amlaparat, and Mauzas Rangkhong Namati, Langpher, Jamunapar, Lumding Mikir, Lumding Kachari, and Lumding Kuki.

Town and villages.

The district contains one town, Nowgong, which in 1901 had a population of 4,430 souls, and 1,117 villages. The villages are not, however, well defined units, clusters of huts which stand out clearly in the centre of the fields tilled by their inhabitants. Rice, the staple crop, is grown in wide plains, dotted over with clumps of bamboos and fruit trees in which are buried the houses of the cultivators. It is groves and not villages that the traveller sees when riding through the more densely populated portions of the district, and not a house can usually be discerned till he has penetrated this jungle of plantains, betel nut trees and bamboos. There is generally no dearth of building sites, there are no communal lands, and there is nothing to keep the population together. It is difficult to tell where one village ends and another begins, or to which of the larger clumps of trees should be assigned the smaller clumps which are freely dotted about amongst the rice fields. The result is that the statistics of villages are of little practical importance, but taking them for what they are worth it appears that villages as a rule run small, three-fifths of the population living in hamlets containing less than 500 persons. The Mikir village, it should however be premised, is quite different from that inhabited by the ordinary Assamese. Like most of the hill tribes they build their houses in clearings near their fields, and the boundaries of the village site can be easily ascertained. They usually live in small hamlets varying in size from three or four to thirty or forty houses.

The earliest estimate of the population was one framed by Mr. Robinson in 1841 who stated that the area was supposed to be 3,870 square miles and the population about 90,000 souls, an estimate which appears to have been too low. The eastern boundary was at this time the Dhansiri and in 1853, after the Naga Hills had been incorporated in Nowgong, the area was given as 8,769 square miles, and the population as 241,300 persons, exclusive of about 100,000 Angami Nagas. This estimate was probably not much beside the mark, but it was not till 1872 that a regular census was taken of the people.

Variation in
population.
Early
estimates.

The statement in the margin shows the population recorded at the last four enumerations and the variation in the intercensal periods. The census of 1872 was not a synchronous one.

Variations
since 1872.

	Population.	Variation + or— per cent.
1872 ...	260,238	
1881 ...	314,893	+ 21
1891 ...	347,307	+ 10·2
1901 ...	261,160	—21·8

It made no pretensions to scientific accuracy, and the excessive increase that occurred during the next nine years affords good grounds for supposing that it was incomplete. The Deputy Commissioner himself pointed out that too much reliance should not be placed upon the returns. The census was a novelty, its objects were not fully understood, and many of the people were afraid that it might only be the preliminary to the introduction of a poll tax. The census of 1891 was probably as accurate as these things can be, and if we assume that the population increased by 25 per cent. in the 19 years that elapsed between the two enumerations, an assumption

which would seem to err, if it errs at all, on the side of over-estimation, the population of 1872 must have been at least 277,000. Between 1881 and 1891, the district was fairly prosperous and healthy, and the natural growth* of the population amounted to nearly 11 per cent. But the seeds of disease had already taken root, and before long the effects of *kala-azar* began to make themselves apparent in the revenue returns, though the awful ravages of this disease were never fully realized till they were expressed in the census figures for 1901.

The history and character of this dreadful fever will be described in the section dealing with the medical aspects of the district, and here it is only necessary to refer to its effects upon the population. Aided by the severe epidemics of cholera and *sm'a'l-pox* with which this sorely afflicted district has been visited, it succeeded in reducing the population to about three-fourths of that recorded in 1891. Terrible though such a reduction is, it fails to give a complete idea of the full effects of this appalling scourge. The gross population of 1901 was swelled by a large number of foreigners brought up to the railway or the tea plantations, and the caste and language tables show that the decrease in the indigenous population during the last intercensal period must have been fully 30 per cent. At the close of the nineteenth century plague and famine were at work in India, and the terrible

* Natural growth here means increase in the number of those born in Nowgong and censused in the Province.

mortality they produced was blazoned abroad to the very ends of the earth. Yet not a single British district in the whole of the Indian Empire lost so large a proportion of its population as the unfortunate district of Nowgong.* The people suffered in silence, the fever killed them steadily but quietly and slowly, and the extent of the havoc wrought was never realized till the results of the census were made known.

But little could be done to mitigate their sufferings. A large number of dispensaries were opened but the treatment and the origin of the disease were alike obscure, and medical science could offer little help. In its initial stages *kala-azar* in no way differs to the casual observer from ordinary malarial fever, and it is only of recent years that the medical profession have admitted that malaria is communicable. Even now that this fact has been realized the difficulties of isolation are immense. The sick linger on for from three months to two years, and it would not be easy to segregate thousands of people for such prolonged periods even if they were willing to submit to this course of treatment. Detection and the subsequent isolation would not take place until the disease had taken a firm hold upon its victim, and had already had ample opportunity of infecting the friends and neighbours.

Kala-azar passed on, leaving behind it a trail of deserted villages and untilled fields, with the jungle creep-

* Bombay and the Central Provinces had the greatest losses. The worst British district in Bombay was Kaira with a loss of 17·8 per cent. the worst British district in the Central Provinces was Saugor with a loss of 20·4.

ing year by year over the kindly works of men. Between 1893 and 1900, the land revenue demand for ordinary cultivation declined by 23 per cent. and the population sank to some fifteen or sixteen thousand less than the probable numbers nearly 30 years before. With such a melancholy record before our eyes it is satisfactory to know that the disease at last is dying out and that the people are again beginning to increase in numbers. The epidemic was most virulent in the Raha tahsil which lost 42 per cent. of its population. The part of the district which escaped most lightly was the north-east corner where many of the tea gardens are situated.

Immigration The tea industry is not nearly so important in Nowgong, as in the Surma Valley or in Upper Assam, and the proportion of foreigners, (11 per cent.) is comparatively small. The total number of persons born outside the Province in 1901 was 29,629, more than a third of whom came from the division of Chota Nagpur. Details for the other Provinces of origin are shown in Table IV. Most of these foreigners were working as coolies either on tea gardens or on the railway. Immigrants other than coolies are represented by the Marwari merchants of Rajputana, artisans from the Punjab, a few Kabuli traders from Afghanistan, and Nepalese who usually earn their living as sawyers or as herdsmen, though some have settled down to agriculture. That Nowgong loses considerably by inter-district transfers is hardly matter for surprise, as it is difficult to understand why any one should voluntarily settle in this much afflicted district while there was

every inducement to the residents to leave its fever stricken villages. Most of the immigrants came from Kamrup and Goalpara, while the emigrants went to Sibsagar and Darrang. The proportion of the latter to the former was nearly three to one in 1901.

As in most of the other districts of Assam, the men in Nowgong exceed the women in numbers, and in 1901 there were only 963 females to every 1,000 males. This disparity is entirely due to the fact that women are in a minority in the immigrant population, and amongst persons born in Nowgong and enumerated in the Province in 1901 there were 1,016 females to every 1,000 males. It is a significant fact that in the last decade there was a large increase in the female element in the population in those parts of Assam in which the mortality was unusually high, and there seem grounds for supposing that the proportion of women tends to increase when public health is bad and vitality low.

The people of Nowgong have no pedantic ideas with regard to early marriage. The statement in the margin shows the percentage of Hindu girls under 10 and between 10 and 15 who have

Percentage of Hindu girls married and widowed.

Age.	Nowgong.	Goalpara.
0-10	0.2	4.8
10-15	10.5	62.4
15-20	Unmarried. 40.1	7.2

performed the marriage ceremony, and the proportion between 15 and 20 who are still unwed. For

purposes of comparison similar figures are shown for Goalpara, as in this district the idea has unfortunately gained ground, that the social status of the family can be raised by imposing the responsibilities of matrimony

on immature girls before they are physically fitted for its functions. Amongst an equal number of girls under 10 there are 24 child wives in Goalpara for every one in Nowgong, and between 10 and 15 the proportion is as 6 to 1. Two fifths of the girls between 15 and 20 in Nowgong are still unmarried, and it is satisfactory to know that the stagnation of the population during the last decade was not due to any unnatural attempt to compel small children to undertake the functions of maternity before their bodies were fitted for this great strain. Such a proceeding, it may be added, only tends to defeat its own ends, as the age statistics recorded in India show, that fertility varies inversely with the extent to which infant marriage is in use.* The attempt to pluck the unripe apple in many cases kills the parent tree, or even where this dire calamity is avoided, deprives it of the power to put forth a second crop.

The growth of the people depends to some extent on the proportion of potential mothers *i.e.* of married women between 15 and 40 in the population. In this respect Nowgong is somewhat at a disadvantage as in 1901 only 14 per cent. of the population were included in this category as compared with 15·7 per cent. in the Province as a whole and 16·9 per cent. in the Central Provinces.

Infirmities.

The abstract below shows out of 10,000 males the number afflicted with the four special infirmities selected for record at the census in Nowgong, in the Province of Assam, and in

	Nowgong.	Assam.	India.
Insane	2	5	3
Deafmute	13	9	6
Blind	7	10	12
Leper	8	13	5

* In this connection see Report on the census of India, 1901, Vol. I, P 480.

the Indian Empire. Deafmutism is exceptionally prevalent, but from the remaining three infirmities Nowgong is comparatively free.

Assamese is the standard language of the district ~~Language.~~ and in 1901 was used by 66 per cent. of the population. Assamese is described by Mr. Grierson as the sister not the daughter of Bengali.* It comes from Bihar through northern Bengal, and not from Bengal proper. The plural and feminine gender are formed in a different way from that in use in Bengali, and there is a considerable difference in the conjugation of the verb, in the idiom, the syntax, and even in the vocabulary. The pronunciation is also different, the Bengali sh. being converted into h. by the Assamese and ch. into s. The chief aboriginal languages are Mikir which is used by 13 per cent. [of the people, and Lalung which is used by 5 per cent. Lalung is a member of the Bodo family and forms a link between Bodo, or the Kachari spoken in the submontane tracts of Kamrup and Darrang, and Dimasa or the Kachari spoken in the hills of North Cachar. Mikir is a link between the Bodo and the Naga groups. Rather more than 2 per cent. of the people returned Kachari as their usual form of speech, but the exact dialect whether Bodo or Dimasa it is difficult to ascertain.

The principal foreign languages were Hindi (5 per cent), and Bengali which was returned by a little under six per cent of the population. Bengali, however, means little more than "foreign language," "Bengali" and "foreigner" being almost inter-changeable words in the

* Report on the census of India, 1901, Vol. I, P. 324.

mouths of the Assamese, and the Bengali of the census tables probably includes many forms of speech of the Dravidian family which would be by no means understood of the people of Nadia.

**Caste and
tribes.**

Historically Nowgong has been somewhat of a border land. It is doubtful whether it ever contained the capital of a powerful prince, and, as a natural consequence, none of the great race castes, which are found in considerable numbers in other parts of the valley, are very strongly represented. It was never colonized by the Ahoms and the number of that caste now found within the district borders is comparatively small. It was some distance from the centre of the Chutiya power, and, in spite of the fact that after the downfall of that kingdom, the Ahoms deported many Chutiya families to other parts of the Brahmaputra Valley, there were less than 7,000 members of that caste in the district in 1901. The Kalitas, the caste that stands for middle class respectability in Assam, numbered a little over 16,000, and there were only 7,000 Kewat's who rank next after the Kalita according to Assamese ideas. The bulk of the population are members of the aboriginal tribes, the Mikirs (36,000), the Lalungs (29,000), the Kacharis (12,000), and the Koch, the Hindu caste to which the hillmen are admitted on conversion, (34,000.) In the following pages a short account is given of those indigenous castes which had 5,000 representatives or more in the district in 1901.*

* An alphabetical glossary of all castes censused in the Province will be found in chapter XI of the Census Report for 1901.

The Borias are a caste peculiar to Assam, which is formed from the offspring of Brahman and Ganak widows and their descendants. Boria is said to be derived from "bari", a widow, but the people prefer to call themselves Sut. This term is said by some to be connected with the word Sudra, and by others to be derived from Sut, the expounder of the Puranas, who was himself the son of a Brahman widow, but the most plausible explanation seems to be that it is an abbreviation of Suta, the name given in the Shastras to the offspring of a Brahman woman by a Vaisya or Kshatriya father. One authority defines a Boria as the child of a Brahman widow, and a Sut as the result of union between a Sudra widow and a Brahman, but it is doubtful whether this explanation is correct, as in the latter case the child would presumably be of the same caste as its mother. The children of Brahman girls who have attained puberty before marriage and so have to be married to men of a lower caste, are also classed with Borias.

Borias.
Males 3,708
Females 4091

It is a singular fact that Borias are more numerous in Nowgong than in any other district, though the number of Brahmans there is comparatively small. The explanation offered by an educated Brahman of that district was that the gosains and mohants of Nowgong had put pressure upon householders to give away young Brahman widows in marriage to men of lower caste. The suggestion seems a strange one from the mouth of a Brahman, but is given for what it is worth. Agriculture is the ordinary occupation of the Borias,

and their manners and customs do not differ materially from those of other low caste Assamese. The Nowgong tahsil is the principal centre of the Boria population.

Brahmans.**Males 3,356****Females 2,769**

The majority of the Brahmans of Nowgong are Assamese as distinguished from Bengalis or up country men. They are said to be the descendants of Brahman families who were brought to Assam towards the end of the fifteenth century from Kanouj, Mithila, Gaur and other places. Most of them live by agriculture, though, as they are unable to touch the plough themselves, they have to get the actual work done for them by hired labourers. The poorer amongst them act as priests, a calling which is considered to entail a certain loss of social status.

Chutiyas.**Males 3,316****Females 3,447**

The Chutiyas, like the Koch and the Ahoms, are one of the race castes of Assam. Their physical appearance suggests a Mongolian origin, their language, which is still preserved amongst the Deoris or priestly clan, belongs to the Bodo family, and it seems probable that they are a section of the great Bodo race which includes the Garo, the Kachari, and the Tippera. It is supposed that their original home was in the hills through which the Subansiri makes its way, and that they entered the Assam Valley before the beginning of the 13th century A. D. They founded a kingdom in the neighbourhood of Sadiya, whose western boundary extended as far as the Disang river, and were overthrown by the Ahoms at the beginning of the 16th century. Their conquerors wisely deported the leading families to different parts of the Assam Valley, but the great mass of the Chutiyas

are still to be found in Sibsagar and Lakhimpur. The caste is divided into four subdivisions, Hindu, Ahom, Deori, and Borahi. The latter, as their name implies, are still unconverted and eat pork, but the number of Borahi Chutiyas is very small. The Ahom Chutiyas have for some generations been converts to Hinduism but in the social scale they rank below the Hindu Chutiya, and their presence in a house is said to debar a Brahman from drinking water there. The Ahom and Hindu Chutiyas can smoke but cannot eat together, and, in theory, cannot intermarry. A member of the Ahom section can, however, obtain a Hindu Chutiya girl if he is willing to pay a slightly higher price for her, but the bride sinks to the status of her husband. Hindu Chutiyas are sometimes united by the *hompura* ceremony, while the *chaklong* rite, which is the Ahom form of marriage, is in vogue amongst the Ahom Chutiyas. This ceremony consists in the interchange of the *temi* and *katari*, the box in which betel nut is carried, and the knife with which it is cut, the tying of the nuptial knot, and a feast to the friends and relations. A hole is then cut in the corner of the house through which the bride is removed. The Chutiyas are far from strict in their views on matrimonial matters, and one native gentlemen reports that 50 per cent of the so called married couples have performed no ceremony at all, and that a girl sometimes changes her husband nine or ten times. The social position of the caste is low, and almost all of them are petty cultivators. They burn their dead and perform the *sradh* ceremony at the

expiry of a month. Brahmans of inferior social standing act as their priests.

Jugis.

Males 7,334

Females 7,711

The Jugis are a low caste whose traditional occupation is weaving, and who are looked down upon by their superiors in the social scale. Like other humble castes, they lay claim to a high origin. According to one account, they are the offspring of Brahman widows and ascetics, while others assert that they are descended from Gorakshanath, who was an incarnation of Siva. They recently submitted a memorial to the Local Administration asking for permission to assume the title of Nath, and they are endeavouring to improve their position by introducing the use of the *hompura* marriage ceremony. They are divided into two subdivisions the *polupohas* and *katanis*, and are ministered to by degraded Brahmans. Very few Jugis now earn their living as weavers, and the caste as a whole has taken to agriculture as a means of livelihood.

Kacharis.

Males 6,700

Females 5,123

An account of the origin of the Kachari tribe has already been given in the preceding chapter. In Nowgong they are divided into two different sections. Those who live in the Barbhagia, Dhing, and Khatoalgau mauzas near the Brahmaputra, are said to be Bodos akin to the Kacharis of Darrang, while those in the valley of the Kapili are Dimasa. The former are known as Jharuas or Chaiduaria Kacharis, the latter as Hojais. The two sections are quite distinct and have nothing to do with one another. There are no subdivisions amongst the Jharuas, but the Hojais are said to be divided into the following clans most of which

are endogamous :—Rabha, Ramsa, Kheremia, Thengal Sonoal, and Jaladha. Their social position is of course low, but the Hindu gosains are willing to receive them as their disciples, and, if they are prepared to abandon their pork and beer, will even enrol them as members of the Koch caste.

Their villages are surrounded with fences, but present a dirty and untidy appearance, as pigs and fowls are allowed to wander about in every direction. Agriculture is their normal occupation, and rice the staple crop grown. But though efficient agriculturists, they have not that contempt for daily labour which is so marked a characteristic of the Assamese. They readily take work on tea gardens, and in 1901 nearly 14,000 Kacharis were censused on the plantations of Assam. Though still using their tribal form of speech in their own villages, most of them can speak and understand Assamese. The national religion is of the ordinary animistic type. The principal god is called Siju and is represented by the cactus which is to be seen growing in the courtyard of every Kachari house. In addition to Siju there are a large number of other spirits, most of which are hostile to men; and the main object of religion is to ascertain in times of trouble the name of the spirit responsible, and the way in which it may most easily be appeased.

Marriage is generally by purchase, a bride ranging in price from Rs. 60 to Rs. 100. Where the man is unable to provide this sum, he works for his father-in-law, a year's labour being usually reckoned as being

worth about Rs. 30. Pregnancy prior to marriage does not entail any social disability, provided that the father acknowledges the child and is a Kachari by caste.

Kalita.

Males 8,419

Females 7,907

The following paragraphs are taken from the Census Report of 1901.

There is much uncertainty as to the origin of this caste. The popular explanation is that Kalitas are Kshatriyas, who fleeing from the wrath of Parasu Ram, concealed their caste and their persons in the jungles of Assam, and were thus called Kul-lupta. Other theories are that they are Kayasthas degraded for having taken to cultivation, an explanation which in itself seems somewhat improbable, and is not supported, as far as I am aware, by any evidence, or that they are the old priestly caste of the Bodo tribe. The latter theory can hardly be said to account for their origin, and though it is possible that Kalitas may have originally acted as priests this fact throws little or no light on the problem of what the Kalitas are. The most plausible suggestion is, that they are the remains of immigrants from India who settled in Assam, at a time when the functional castes were still unknown in Bengal, and that the word "Kalita" was originally applied to all Indian immigrants who were not Brahmans. The Kalitas are divided into two main subdivisions, Bar and Saru, and into a number of professional sub-castes. In Upper Assam, Bar Kalitas are said to decline to use the plough, though they occasionally work with the spade, but there is no such restriction in Kamrup, where the great bulk of the caste is found. Cultivation is, in fact, the traditional occupation of the caste, and they even consent to work as coolies on tea gardens. The usual procedure for a Kalita who has succeeded in rising above the necessity for manual labour, and is no longer compelled to follow the plough, is to call himself a Kaist or Kayastha. Two explanations are given of the origin of the Saru Kalita—one that he is the offspring of persons who for three generations back have not been united by the "*Hom*" ceremony, the other that he is the child of a Bar Kalita and a Kewat woman. Whether the Bar Kalita can inter-marry with, and eat *kachchi* with the Saru Kalita seems open to question, and the practice apparently varies in different districts; but there seems to be no doubt that the functional subdivisions of the caste are debarred from the privilege of close intercourse with the Bar Kalita. These subdivisions are the Mili, Sonari, Kamar, Kumhar, Napit, Nat, Suri

and Dhoba. The first two inter-marry with the Saru Kalita, and also with the Kamar Kalita. The last four groups are endogamous. All these functional groups are to some extent looked down upon, probably because followers of these professions, who were not true Kalitas, have occasionally succeeded in obtaining admission within their ranks; but the goldsmiths, from their wealth, have secured a good position in society, Kalitas have a good Brahman for their priest, and their water is taken by every caste, a fact which no doubt explains the high value attached to Kalita slaves in the time of the Assam Rajas, when two Kochees could be purchased for the price of a single Kalita, though the Koche is generally the harder and stronger man of the two.

Early marriage is common in Goalpara, but not in Assam Proper except amongst the upper sections of the caste. They take, in fact, a liberal view of the relations between the sexes, and cohabitation is the essential part of marriage. Well-to-do Kalitas are invariably united by the *hompura* rite and employ a Brahman, but the poorer people often content themselves with the *agchauldia* or *juron* ceremonies. Some authorities hold that this, though a valid form of marriage for the lower Assamese castes, is not sufficient for the Kalita. They regard the *hompura* rite as the one essential ceremony of purification, but it can be performed after cohabitation has begun, and sometimes takes place after the death of the husband. An unmarried girl who becomes pregnant does not forfeit the position in the society unless her lover is of a lower caste.

The great centre of the Kalita population is to be found in the Samaguri and Nowgong tahsils and in the mauzas immediately to the east.

Many of the Kayasthas are foreigners and most of them earn their living as clerks or officers in the employ

Kayasthas.
Males 1,337
Females 913

of Government or of Managers of tea gardens. A certain number of Kayasthas are also really Kalitas who have risen above the necessity for performing manual labour.

Kewats

Males 6,784

Females 6,506

The Kewats are a respectable Hindu caste, from whose hands Brahmans will take water, and who according to Assamese ideas rank immediately after the Kalita. These remarks only hold good, however, of the Halwa or cultivating Kewats, as the Jaliya or fishing subdivision of the caste occupy a very humble position in the social scale, and are considered little better than the Nadiyals. The two sections of the caste have nothing whatever in common except the name Kewat or Kaibartta, but the number of Jaliya Kewats is comparatively small. The ordinary occupation of the caste is agriculture, but a few of them have succeeded in reaching that desirable position in which the pen takes the place of the ploughshare as a means of livelihood. A respectable Brahman acts as their priest. The Patias are a section of the Kewats who migrated to Nowgong from Upper Assam at the time of the Burmese invasions. Mat-making was their occupation and this was the origin of their name. Most of them have now taken to agriculture and intermarry with other Kewats.

Koches.

Males 18,745

Females 17,446

The Koches are one of the race castes of Assam. Originally they were an aboriginal tribe, apparently of Mongolian origin, which at the beginning of the 16th century rose to power under their great leader Viswa Singh. His son, Nar Narayan, extended his

conquests as far as Upper Assam, Tippera, and Manipur, and by the middle of the 16th century, the Koch king had attained to a position of such power that the aboriginal people were anxious to be enrolled as members of his tribe. The result is that at the present day the name is no longer that of a tribe but of a caste into which new converts to Hinduism are enrolled. In Sibsagar and Lakhimpur these converts still retain their tribal names, and the Koch is a respectable Sudra caste, which is not broken up into various subdivisions. This is not the case in Lower Assam, and the different groups are there allotted a different status, which is dependent on the time that has elapsed since conversion took place, and the extent to which aboriginal habits have been shaken off. The principal subdivision is the Bar Koch, who are looked upon as a clean Sudra caste and from whose hands Brahmans will take water. The same distinction is not accorded to the Saru Koch, though they conform in most essentials to the somewhat lax standard of Hinduism exacted in Assam. Three other subdivisions are graded in accordance with the extent to which they have forsworn the attractions of unconverted life. The Kamtali abstain from intoxicating liquor and usually from pork, the Hiremia still keep pigs but no longer indulge in the use of liquor, while the Madahi are Hindus only to the extent of having taken *saran*, and still permit themselves great freedom in all matters of food and drink.

The Lalungs are a member of the Bodo family and their language forms a link between Bodo or Plains

Lalungs.
Males 13,542
Females 15,413

and Dimasa or Hills Kachari. Their name is said to be derived from *lal* (saliva), as, according to the tribal legends, they sprang from the saliva of a local god. The bulk of the tribe are to be found in the *chapari* north of the Kalang, the Raha tahsil, and the mauzas near the junction of the Kapili and the Kalang, but their numbers were terribly diminished between 1891 and 1901. *Kala azar* was especially prevalent amongst them, and in the short period of ten years the Lalungs declined in numbers from 46,658 to 28,985, a loss of life which it is positively painful to contemplate. Part of this decrease was possibly due to the inclusion of converted Lalungs in the ranks of the Koch, but there can be little doubt that the mortality amongst the tribe was quite appalling. According to their own account, they originally lived near Dimapur, but moved into the Jaintia Hills to avoid the necessity of providing the Kachari Raja with human milk, an article of diet for which he had an unreasonable craving. This legend is referred to in a history of the Dimarua Rajas compiled in 1772. A. D. This history has it that when Pratappur, a city on the north bank of the Brahmaputra, was captured by Arimatta, a large number of the inhabitants fled to Demera, a fertile region in the country of the Kachari Raja. This prince was in the habit of drinking human milk, a habit which earned for him the dislike of his subjects young and old. One day, two of the king's messengers entered the house of a Mikir woman and found her nursing her baby. One man seized the infant while the other attempted to

milk the mother, who, furious with indignation, stretched him dead at her feet with a blow from a hoe. The Demera Raja feared that the Kachari prince would punish him for this murder, as it occurred within his territories, and migrated westwards to Dimarua with all his people.

Another legend represents the Lalungs as moving back from the hills into the plains, as they disliked the ruling of the Khasi chiefs that inheritance should go through the female line. Their own rules of inheritance are, however, strange. A woman may either enter her husband's clan or the husband may enter that of the wife, but all property and children of the marriage belong to the clan which was adopted at the time of the wedding. If a man enters his wife's clan he can leave it at her death but generally loses all claim to his property and children. In the plains the Lalungs live in houses similar to those occupied by the ordinary Assamese, but in the hills they build, like other aboriginal tribes, on platforms or *changs* raised a few feet above the ground. They are great opium eaters, and the indifference and idleness produced by that drug combined with the heavy cash expenditure incurred on its purchase, tend to keep them poor. The story of the Phulaguri riot, when the cultivation of opium was prohibited in 1861, has been already told in the preceding Chapter. The tribe is very faithful to its ancestral faith and the number of Lalungs who described themselves as Hindus in 1901 was very small. Their religion is of the ordinary animistic type, and is chiefly

concerned with the propitiation of evil spirits and with sacrifices to ensure prosperity. Like other animistic tribes they eat pork and fowl and drink rice beer; but as poultry and pigs are incompatible with gardening, the houses of the Lalungs are not surrounded by the dense groves of fruit trees found in the villages inhabited by the Assamese. The most important part of the marriage ceremony is the feast to the relatives and friends, and their girls, prior to marriage, are allowed a considerable degree of latitude as long as they do not confer their favours outside the tribe.

Mikirs.

Males 17,993

Females 17,338

According to Colonel Dalton, the Mikirs were originally settled in the North Cachar Hills but were driven westward into Jaintia territory by the Kacharis. Dissatisfied with the reception accorded to them there, they sent an embassy to the Ahom Governor at Raha, offering to place themselves under the protection of his master, but, as the luckless delegates were unable to make themselves understood, they were forthwith buried alive in a tank which that officer happened to be excavating. Hostilities ensued, but the Mikirs were soon suppressed, and were settled in the hills that bear their name, though a considerably colony are still to be found in south Kamrup and the northern slopes of the Khasi Hills. They are divided into four tribes Chintong, Ronghang, Amri and Dumrali, and these tribes are again subdivided into various exogamous groups. In the hills the Mikirs live by *jhum* or shifting cultivation, and raise crops of cotton, chillies, rice, and vegetables. All the members of a family live in

one house, which is thus of considerable size. Their religion is of the usual animistic type, and is chiefly concerned with the propitiation of evil spirits. Infant marriage is unknown and sexual license within the tribe prior to marriage is tolerated. A full account of the Mikirs will be found in the monograph now under preparation.

The Doms, or as they prefer to call themselves, Nadi-
yals are the boating and fishing caste of Assam. They
are anxious to assume the name Jaliya Kaibartta, but the
Kaibarttas are unquestionably a different caste, though
their manners and customs do not differ materially from
that of the Assamese Nadiyal, except in the following
particular. The Kaibarttas decline to use the *ghakata*
net, and in theory only, sell their fish on the river's
bank within a paddles throw of the boat, whereas
the Nadiyals regularly take their catch to market.
The Nadiyals are probably descended from the abori-
ginal race of Doms, the ruins of whose forts are still
to be seen in India, but migrated to Assam before the
Dom caste had been assigned the degrading functions
now performed by them in Bengal. They are cleanly
in their habits and particular in their observance of
the dictates of the Hindu religion, and account for
the objectionable expression "Dom," which undoubtedly
they have borne for centuries, by saying that they
were the last of the Assamese to be converted from
Buddhism. They are darker in complexion than most
of the Assamese, but have a good physique and by
no means uncomely faces. Their women are most

Nadiyals.
Males 9,346
Females 9,541

prolific, and the Dom villages are full of fat brown babies. They rank very low in the social scale, and, according to Assamese ideas, are superior only to the Brittil Baniya or Hari. The bulk of the caste still live by fishing, and education has made but little progress among them. Marriage does not take place till the girl is fully grown, and they are free from any puritanical notions with regard to the relations between the sexes. Their priests are said to be descended from a Brahman father and Nadiyal mother, but for all practical purposes they are Nadiyals and intermarry with Nadiyal girls. The bulk of the caste are found in the Nowgong and Raha tahsils near the banks of the Kalang. In the reign of Kamaleswar (1795-1809 A.D.) all Doms were compelled to have a fish tattooed upon their foreheads, and in 1855 Major Butler reported that there were still men living in Nowgong who were branded with this mark.

Wamasudras.
Males 2,628
Females 2,671

The Chandals are a boating and fishing caste, said by Manu to have sprung from the union of a Brahman woman with a Sudra, and therefore to be the lowest of the low. They are a cheerful and hardworking people but are heartily despised by their Hindu neighbours, and a degraded Brahman acts as their priest. A section of the Chandals has formed itself into a separate caste called Hira. They work as potters but do not use the wheel, laying on the clay in strips. Many of the Chandals have now taken to agriculture. Most of them live in the western portion of the district, north of the Kalang.

Classified by religion the population of Nowgong **Religion.** was distributed in the following proportions in 1901.—Hinduism 64 per cent. Muhammadanism 5 per cent. Animism 31 per cent. The three principal sects of Hinduism recorded at the census of 1901 were Saktism, Sivaitism, and Vaishnavism.

Nearly eight per cent. of the Hindus in 1901 **Saktism.** described themselves as followers of Sakti, but almost five-sixths of the Saktists were censused on the tea plantations or the railway. The great majority of these persons were no doubt so styled, because they ate meat and drank liquor, though this in a garden cooly is not so much an indication of his adherence to the goddess Kali as of the uncertainty of his title to the name of Hindu at all. Saktism is a foreign growth in Assam and Vaishnavism is the national form of Hinduism.

Sivaitism is the counterpart of Saktism and is con- **Sivaitism** cerned with the worship of the procreative energy as manifested in the male. In 1901, only 644 persons in Nowgong professed this special form of Hinduism.

A considerable number of Hindus did not attempt to **Vaishnavism** specify their sect in 1901, but of those who committed themselves to this extent 90 per cent. declared their adherence to Vaishnavism. This form of Hinduism is thus described in the Census Report for 1901.

“Sankar Deb, the apostle of Vaishnavism in Assam, was born in 1449 A. D., and was the descendant of a Kayastha, who, according to tradition, had been sent, with six of his caste fellows and seven Brahmans, to Assam by the king of Kanaijpur as a substitute for the Assamese prime minister, who had fled to

his court for refuge. The licentious rites of Saktism had aroused his aversion while he was still a boy, and his desire to found a purer system of religion was increased by the teachings of Chaitanya in Bengal. Like most reformers, he met with vehement opposition from the supporters of the established order, and he was compelled to leave his home in Nowgong and to fly to the inhospitable jungles of the Barpeta subdivision, where, in conjunction with his disciple, Madhab Deb, he founded the Mahapurushia sect, the main tenets of which are the prohibition of idolatry and sacrifice, disregard of caste and the worship of God by hymns and prayers only. Sankar himself was, like a true follower of Chaitanya, a vegetarian, but the low-caste people, who formed a large proportion of his converts, found his injunction a counsel of perfection, and the Mahapurushias are accordingly allowed to eat the flesh of game, but not of domesticated animals, though, with a subtlety only too common in this country, they observe the letter of the law, prohibiting the spilling of blood, by beating their victims to death. The great centre of the Mahapurushia faith is the Sattrā at Barpeta, where a large number of persons persist in living huddled together, in defiance of all the laws of sanitation, and resist with surprising pertinacity all efforts to improve their condition. They are a peculiarly bigoted people, and are strongly opposed to vaccination, with the result that the mortality from small-pox in the neighbourhood of the Sattrā is exceptionally high. It was not long, however, before the Brahmans re-asserted their influence, and shortly after Sankar's death, two of his followers, who are members of this caste, established sects, called, after their founders, Damodariya and Hari Deb Panthi, which are distinguished from the Mahapurushias by the respect paid to the distinctions of caste, and a certain tolerance of idolatry. A fourth sect was founded by one Gopal Deb, but it originally seems to have differed in no way from the Mahapurushia creed, and subsequently its followers adopted the teaching of Deb Damodar. There is, in fact, practically no distinction between the Damodariyas, the Hari Deb Panthis, and the Gopal Deb Panthis, and the Vaishnavites of the Assam Valley can be divided into the Mahapurushia and Bamunia or "other Vaishnavas", as they have been called in the census tables. The former will accept a Sudra as a religious guide, worship no God but Krishna, and are uncompromising in their hostility to idols; the latter will only recognise Brahmans as their Gosains, permit the adoration of other deities, such as Siva and Kali, in addition to that of Krishna, and allow sacrifices to be offered in their honour."

The Bamunias are also more liberal in their diet, and will eat goats, pigeons and ducks, a form of food that is not allowed to orthodox Vaishnavites in Bengal. Madhab Deb, like most religious reformers, was a strict disciplinarian. The story goes that the breach between him and Gopal Deb, arose one stormy day when the party were returning to Barpeta by boat. Gopal Deb, anxious for the safety of his teacher, apostrophised the storm clouds passing overhead, and begged them to restrain their fury till Madhab had reached the shore in safety. This innocent remark was construed into an invocation of Varuna the god of rain, Gopal Deb was denounced as an idolater and was incontinently by order of Madhab, flung out of the boat. Such treatment was enough to damp the enthusiasm of the most ardent disciple. Gopal Deb, wallowing in the water, gallantly shouted out defiance to his former leader, and warned him that in future he would be treated with uncompromising opposition. The proportion of Mahapurushias in Nowgong is exceptionally high, and in 1901 about two-thirds of the Vaishnavas declared themselves to be members of this sect.

The chief exponents of the Vaishnavite faith are ^{The} the gosains who live, each in his *sattr*a or college, ^{Vaishnavite-} surrounded by his *bhokots* or resident disciples. Many ^{Gosains.} of these *sattr*as are supported by large grants of revenue free land, made by the Ahom kings and confirmed by the British Government, and the gosain receives an annual contribution, varying from four or five annas to two rupees or more, from each of his

shishyas or non resident disciples. This subscription is generally paid through a *medhi* or agent, who holds an important position in the social economy of the village, and often ranks with the *gaobura* or village headman appointed by the Government. At certain seasons of the year the gosains tour through the villages, are visited by their followers, and receive into the Hindu faith members of the aboriginal tribes who are considered worthy of admission. These progresses are generally attended with considerable pomp and dignity. If the journey is made during the rainy season the gosain and his followers travel in state barges, whose curved prows and slender lines distinguish them from the ordinary rough-built country boat. Most of the *sattras* own one or more fine elephants, and these ponderous animals take a prominent part in the procession that escorts the spiritual leader of the people. The gosain himself is carried in a litter, drums are beaten and cymbals clashed before him, and when he alights he is not permitted to touch the ground with his bare feet. It is not always that the influence of the priest is used for good. Bigotry and intolerance and a dislike to change or progress in any form are often found in those who profess to be the ministers of God, but from reproaches of this kind the Vaishnava gosains of Upper Assam are almost entirely free. Dignified but courteous in their demeanour, they have ever been noted for their loyalty to Government, and their influence is altogether beneficial in encouraging purity of life and obedience to the authorities. The

bulk of the Assamese Hindus in Nowgong are disciples of one or the other of the following gosains, whose *sattras* are situated on the Majuli in Jorhat—Auniati, Dakhinpat, Garamur, Kamalabari, Elengi, Karatipur, and Mahara. The Matak gosain of Lakhimpur has also a certain following in the district.*

The typical *sattr*a consist of a *namghor* or prayer house, which is a large open shed supported on massive wooden pillars. The roof is generally made of thatch supported on massive wooden pillars, and at one end there is often a shrine in which the titular idol is carefully screened from the vulgar eye. The floor is made of beaten earth, and there are generally a few drums and cymbals lying about which are used in the daily ritual. The house of the gosain is situated near the *namghor*, and, in close proximity, there are store rooms which contain a liberal stock of rice, and all the various products of the country, fine silk cloths, and a valuable collection of native jewellery. The resident *bhokots* live in lines of cottages. The whole premises are usually enclosed by a fence or wall, which is entered through a rustic lichgate, and, as they often contain really magnificent umbrageous trees, the general effect is very picturesque. In the more important *sattras* gosains and *bhokots* alike are celibates, and the place resembles some mediæval monastery; but in the smaller institutions, a category to

The Sattr.

* For an account of the Mataks reference should be made to the Gazetteer of the Lakhimpur district.

which all the *sattras* in Nowgong belong, celibacy is not enforced and women and children are found living round the *namghor*. Hinduism is so liberal in Assam that in many of these colleges the presiding priest is a Kayastha, often no doubt a Kalita, and Assamese Brahmans are sometimes to be found who consent to accept as their spiritual guide a man of lower caste.

Statement A appended to this chapter shows the situation of each *sattr* in Nowgong, the date of its foundation, and the amount of land which is held on privileged terms. Though Kuruabahi is a comparatively small *sattr* and holds but a small area of land at privileged rates, it is one of the four premier *sattras* of Assam, the other three being Auniati, Dakshinpat, and Garamur. The founder of the three great *sattras* on the Majuli enjoined celibacy upon their inmates, but such an injunction obviously requires that provision should be made elsewhere for each succeeding generation of gosains. The people of Kuruabahi were accordingly allowed to marry, so that from their community priests could be obtained who had grown up amongst the traditions and surroundings of a *sattr* and who could be trusted to carry on the policy of their predecessors.

Muhammadanism.

Nowgong never came much under the influence of the Muhammadans, and in 1901 less than 5 per cent. of the population professed the faith of Islam. Nearly all of these persons were members of the Sunni sect.

The Muhammadans of Nowgong are said to be a fairly enlightened, if not a numerous community. The villagers

understand the principals of their faith, and it is still fairly free from Hindu superstitions. They try, however, to ascertain an auspicious day for the commencement of any undertaking, and sometimes consult a Hindu pandit for this purpose. They also observe the *nowai tolani* and *nowai* ceremonies, when a girl attains puberty or is married, and bathe their cattle on the occasion of the *Bihu*. A class of semi-Muhammadans called *dhakari* worship Bishohari the goddess of snakes. The Morias are a section of the Muhammadans who are said to be the descendants of 900 men who were taken prisoner when Turbuk was defeated in 1532. They were first employed to tend the Ahom elephants but offered grass to their tails instead of to their trunks. They were then ordered to grow paddy but they plastered the seedlings over with mud. They were finally made braziers, and at the present day are to some extent looked down upon by their co-religionists. Service is usually held in a small thatched hut, and there is no organized system for the propagation of the faith. In spite of this conversions occasionally take place, and the decrease amongst Muhammadans during the last decade was only 11 per cent. as compared with 25 per cent. in the district as a whole.

Nearly one-third of the population are still faithful Animism. to the primitive forms of tribal religion which are usually described as animistic, most of whom are living in the Mikir Hills or in the Raha tahsil and the mauzas to the south.

Most men find considerable difficulty in giving a

clear and intelligible account of the faith that is in them, and these simple people are no exception to the general rule. Broadly speaking their religious beliefs seem to fall under the following heads. Unlike the German metaphysician, they have no uncomfortable doubts with regard to their own existence and the existence of the material world. To account for the production of these visible phenomena, they put forward various theories, which are hardly more improbable than the accounts of the creation given in most religious systems. But the way in which the world came into existence is, after all, a matter of no very great importance, and the essential object of religion is to ensure a comfortable passage through life to its followers. No country or community is exempt from pain and trouble, and to the dwellers in the plains of India has been allotted a fairly liberal portion of the ills of life. When the cattle die, or small-pox or cholera visit the village, or other trouble comes, it is only natural to suppose that somebody or something is the cause of these misfortunes. The simple tribesmen then endeavour to ascertain the particular spirit from whose displeasure they are suffering, and to appease him in whatever way they can.

But, apart from special pujas of this nature, it is usually thought desirable to sacrifice at least once a year to the Deity to secure immunity from sickness and good harvests. Amongst the Hojais and Lalungs this sacrifice was invested with great ceremony, and the most acceptable of all offerings, human life, was made

prior to our occupation of the country. The connection between religion and morality is very slight, and the Lord their God is a jealous god, whose wrath must be averted by the proper offerings. Amongst the Mikirs success in theft is said to be due to skill in sacrifice, and though they believe in a future life, and have some idea of a special state of bliss, entrance to this heaven depends upon the somewhat peculiar qualifications of having danced the one legged dance and eaten the fat of the great lizard, and duck, pheasant, and cocoanut.

The Hojais on the other hand seem to be very doubtful as to the existence of a life beyond the grave and certainly do not trouble themselves very much about it.

The religions which were not strongly represented in the district in 1901, were Jains (243), Sikhs (214), ^{Minor religions} Buddhists (49), and Brahmos (7). The Jains are Kaiyas or Marwari merchants who have succeeded in securing a practical monopoly of the wholesale trade of the Assam Valley. Like the English, they are temporary visitors and have not permanently settled in the Province. The Sikhs are the descendants of soldiers who came for service to Assam about 1825 or a little later. The original settlers have inter-married with Kewats, Koches, and Kalitas, and all, except the latest arrivals from the Punjab, have now an admixture of Assamese blood. The majority have taken to agriculture but their community includes a few carpenters and contractors. They are found in the Singaon and Hatipara villages in the *sadr* tahsil and at Chaparmukh. Most of the Buddhists were censused on the railway, and the fact that they

were nearly all males, suggests that they were temporary visitors.

Christianity. The number of Christians in Nowgong is smaller than in any district in the Province except the Lushai Hills. A branch of the Baptist mission is located in Nowgong town, with an off-shoot in the Mikir Hills, and most of the native Christians were members of that sect.

**Number of
Native
Christians.**

1881 .. 204
1891 .. 354
1901 .. 496

From the statement in the margin it appears that Christianity has been spreading steadily if slowly amongst the natives during the past twenty years, but it is doubtful whether at present it has many attractions for the plains-men in Assam. The number of degraded castes is comparatively small, and, if the animistic tribesman once makes up his mind to abandon the religion of his fathers, he finds greater attractions from the social point of view in Hinduism than in Christianity. The gosains show considerable tact in the treatment of their converts, and do not expect them to abandon all at once the forbidden food to which for many generations they have been accustomed. The desire for material progress has not much hold upon the natives of Nowgong, and they prefer an idle opium eating life with the additional social distinction that Hinduism gives, to the more strenuous existence enjoined by the teaching of Christ's ministers.

Occupation.

Nowgong is a purely rural area and nine-tenths of the population in 1901 were supported by agriculture. As is only natural in a district in which there are broad tracts of land available for cultivation, the bulk of these

agriculturists are small farmers who hold direct from the state, and the number of tenants is inconsiderable. About one-twelfth of these cultivators were garden coolies, a proportion much lower than that prevailing in Darrang and Upper Assam. The only other occupation which supported as much as one per cent of the total population was general labour, a head which included the coolies engaged on the construction of the railway. The extraordinary preponderance of agriculture as a means of occupation is due to two causes. In the first place the district is a purely rural one. It contains only one small town, and the urban population is less than two per cent of the whole. There is moreover an almost complete absence of the functional castes. There is no village barber or dhobi in Assam Proper, and, though there are a considerable number of Jugis in Nowgong, they no longer earn their living at the loom. It would hardly be correct to say that they have forsaken their traditional occupation, as they, in common with most of the villagers in the district, are weavers; but the work is carried on by the women, and only enough clothing is produced to satisfy the requirements of the family, or perhaps to provide a few silk cloths to sell when money is urgently required. Occupation has not been specialized in the Assam Valley, and each household supplies almost all its simple wants. There are a considerable number of fishermen, but many of them have either abandoned their traditional occupation for agriculture, or have at any rate preferred to return it as a more respectable avocation

on the census schedules. The proportion of priests is fairly high, but that of teachers and village doctors low. Both the Assamese and hillmen are cultivators pure and simple. They have no aptitude for trade, no liking for the arts and crafts, no desire for any other means of livelihood than the plough and hoe. In the social as well as the material world great masses tend to attract the smaller units by their weight. It is the fashion amongst the natives of Nowgong to earn their living as Adam did. There is an abundance of land in the district, so that there is no reason why every man should not be in the fashion, and, as far as possible, he is.

At the census of 1901 the occupations of the people in Nowgong were divided into the following main classes.

			Total Number	Percentage.
Government	...	...	753	0
Pasture and agriculture	...	...	285,751	90
Personal services	...	...	2,867	1
Preparation and supply of material substances	...	...	8,906	4
Commerce, transport and storage	...	...	3,253	1
Professions	...	...	1,883	1
Unskilled labour, not agricultural	...	...	5,132	2
Means of subsistence independant of occupation	...	...	2,616	1

In the second part of the Census Report details will be found for the 520 separate heads into which the occupations of the people were divided, but in the immense majority of cases the figures are so small as to hardly repay examination.

**Marriage
customs.**

The forms of marriage in vogue are the *hompura** or

* A description of this ceremony as practiced in Assam will be found on p. 63 of the Census Report for 1901.

full Hindu rite, when the sacred fire is lighted and a priest is engaged to perform the ceremony; the *kharu moni pindha*, in which a feast is given to the friends and relations and ornaments are given to the girl; and the system under which the bridegroom, who is called a *caponiya*, enters the house of his prospective father-in-law, and works for his wife as Jacob worked for Rachel. Brahmans, Kayasthas, and well-to-do Kalitas invariably perform the *hompura* ceremony, which sometimes costs as much as Rs. 500. This expenditure is incurred on the purchase of ornaments and clothing, on the payments of priests, musicians, and palki bearers, and on a feast to the relations and friends, the principal ingredients of which are rice, molasses, curds, and betel nut.

The practice of taking a bride price is still fairly common amongst the lower castes, but it is falling into disfavour and is by no means as universal as in Kamrup. A girl can sometimes be obtained for Rs. 20, but, if she is an expert weaver and is generally skilled in house work, the parents will sometimes ask for and obtain five or six times that sum. An Assamese woman is a house keeper, weaver, and cook as well as a wife, and in many cases a farm labourer as well; and parents and guardians do not always see why a young man should be given such a valuable help-meet, when they have had the expense of feeding and clothing her when she was too young to work, and paying for the various ceremonies that are prescribed by local custom at certain stages of her career. If the price

demanded is too high the young people often take the law into their own hands, and the girl arranges to have herself abducted; as, when her lover has once obtained possession of her person, he is generally able to induce the parents to be more moderate in their demands. This form of marriage by capture is very common amongst the Nadiyals, Brittial Baniyas, and Charals or Namasudras; and, according to the mauzadar of Garubat, nine girls out of ten belonging to these castes are abducted in this manner. The *caponiya* is a person who works for his prospective father-in-law in lieu of making a cash payment for the bride. He is generally accorded all the privileges of a husband as soon as the parents of the girl are satisfied that he intends to remain faithful to his engagement. Marriage even by the simplest rites entails a heavy charge upon the bridegroom. Twenty rupees is the lowest estimate quoted by any of the officers consulted, and the ordinary cultivator often spends between one and two hundred rupees upon his wedding, a sum out of all proportion either to his capital or income. The result is that many men have to borrow at high rates of interest to obtain a wife, and are often crippled for years by the expenses incurred on the occasion of their marriage.

**Amusements
and festivals.**

Feasts, singing parties, and *bhaonas* or simple theatrical performances are the principal amusements of the villagers. The *bhaonas* are often held in temporary sheds constructed by the road side, and on a winter's morning the traveller who is early abroad, frequently comes upon parties of revellers still lingering over the

pleasure of the previous night. The *doljatra* or festival in honour of Krishna in February or March, when the image of the god is swung to and fro, and the people pelt one another with red powder in memory of his amorous exploits with the milkmaids of Brindaban, is observed indeed, but with much less ceremony than in other parts of India. On the gardens, however, and amongst the foreign cooly population this festival, which is styled the *fagua*, is an occasion of very boisterous merry-making. The Janmastami in honour of Krishna's birth in August or September, and the Sivaratri, in memory of Siva in March, are kept as fasts rather than feasts. The Durga Puja is observed by Saktists, but, as this sect has only a small following in Nowgong, it is not a local festival of much importance.

The special festivals of the Assamese are the three *Bihus*, and the *sradh* ceremonies of Sankar Deb and Madhab Deb, the founders of the Mahapurushia sect. The Kartik *Bihu* is celebrated on the last day of Asvin (Oct. 14th), and is not an occasion of very much importance. Hymns are sung in honour of God, and in place of their usual meal of hot rice and curry the people take cold food such as curds, molasses, plantains, and cold rice. The Magh *Bihu* is the harvest home, and begins on the last day of Pous (January 14th). For weeks beforehand tall heaps of rice straw piled round a central pole are a prominent feature in the rural landscape. At the dawn of day the villagers bathe and warm their chilled bodies at these bonfires which must be most acceptable to young and old alike, as at this

season of the year the morning are always cold and generally foggy. The Magh *Bihu* is to some extent a children's festival, and most of the jollification is confined to the young children who sing and dance, and feast in small grass huts that have been specially constructed for the purpose. The Baisakh *Bihu* which begins on the last day of Choet (April 14th) is held in honour of the new year. The cattle are smeared with oil, mixed with matikalai, turmeric, and rice and are then taken to the nearest stream and bathed. The villagers go from house to house visiting their friends and relatives and present one another with cloths and other products of the country. Buffalo fights are organised in the rice fields but these contests are rather tame affairs, and the animals very seldom injure one another. The villagers leap, wrestle, and race together and try to see who can run the furthest without drawing breath (*han khel*). Other games played are a kind of chevy and an Indian variety of tip cheese. Various games of ball, which include a good deal of wrestling and pushing, are also played. The festival is an occasion of some license, as boys and girls dance together in the fields and sing suggestive songs, and lapses from chastity between members of the same caste are considered almost venial. It is at this season of the year that run-away matches are most common, and during the next few weeks the outraged but avaricious parent complaining of the abduction of his daughter is by no means an uncommon sight in the local courts. The *sradh* ceremony of Sankar Deb is celebrated in August—September and that of Madhab three days before the Janmastami. All

work is laid aside on these days and the people devote their time to feasting and the singing of hymns.

The temples of Nowgong are small and unimportant, **Temples.** and none of them have any pretensions to architectural merit. But this is nothing strange, as Saktism was never warmly accepted by the inhabitants of the district, and it is not to be expected that many shrines would be erected in its honour, or that those which existed would be carefully preserved. Statement B appended to this chapter shows the position of the various temples supported by grants of land. All except two, the temple at Kamakhya and the Sada Siva temple, are wretched temporary buildings of reeds and thatch.

Apart from the *sattras* and temples and the shrines **Other sacred places.** to which reference has been made in the account of the mountain system of the district, there are not many sacred places in Nowgong. There are the remains of a temple dedicated to Buragohain in the Bar Kolagaon forest in the Jagial mauza, and in the Namati mauza there is a sacred pool called the Akashi Ganga in Parkhoa village. Barduar in Dhing mauza is venerated as it was once the residence of Sankar Deb, and there is an altar to Mahadeo, which is still the scene of local sacrifices, in the Sahari mauza. Traces of the primitive form of Bodo worship are also to be seen near Silghat where there are some rock sculptures which are said to be sacred to Kechakhati, the savage goddess who delighted in the quivering flesh of the human victim, and to whom for many centuries a male without blemish was offered in the little copper temple near Sadiya.

CHAPTER IV.

AGRICULTURE AND FORESTS.

Crops grown—Rice—Mustard—Pulses—Fibres—Storage and threshing of grain—Agricultural implements—Sugarcane—Preparation of molasses—Causes affecting productiveness of land—Garden crops—Yield and value of crops—Floods—Irrigation and attempts to improve the system of cultivation—Live stock—Grazing grounds—Cattle disease—Commencement of tea industry—Labour force—Soil—Varieties of plant—System of cultivation—System of manufacture—Outturn and prices—Forests.

Crops grown The staple food crop of the district is rice which in 1902-03 covered 56 per cent. of the total cropped area. Other important crops are tea (5 per cent.), and orchard and garden crops (8 per cent.), but a large part of the area shown under this head, is occupied by the homestead, and it is doubtful whether as much as one half is actually under cultivation. Mustard occupied 19 per cent. of the total cropped area and til (*sesamum indicum*), which is grown much more extensively in Nowgong than in the other districts of Assam Proper, nearly one per cent. Miscellaneous food grains, nearly all of which are different forms of pulse, formed 6 per cent., and sugarcane 0·7 per cent. of the total. Wheat, barley, and gram, the food grains of Upper India, are grown in small patches by immigrants from those parts, but the total area under

these three crops in 1902-03 was only 37 acres. Cotton is grown by the Mikirs in the hills, and covers an estimated area of about 2,000 acres. The area under this and other crops since 1901 is shown in Table VI. The general system of cultivation and the manner in which the staple crops are raised is described in the following paragraphs.

Rice falls under three main heads *sali*, *ahu*, and *bao*, Rice. Sali. the proportion of the total rice area normally occupied by each of these three classes, being *sali* 51 per cent., *ahu* 30 per cent., and *bao* 19 per cent. *Sali* dhan or transplanted paddy, is first sown in little beds or nurseries (*palang*) near the homestead. The land is broken up in April or May, and is ploughed five or six times. The size of the nursery varies with the area to be planted out, but generally stands to the rice fields in the proportion of about 1 to 15 or 20. The seed, which has been selected from the largest ears of the previous year's crop, is sown broadcast over the bed in May and June, and during the time that this operation is going on, water is sprinkled over the bed from a bamboo scoop (*lahoni*). It comes up a rich emerald green, and at the beginning of summer these patches of the brightest green herbage are a striking feature in the rural landscape. In the meanwhile the fields are being got ready for the reception of the seedlings. The husbandman starts ploughing as soon as the soil is softened by the spring rain, and repeats the process from four to eight times till he has reduced the land to a rich puddle of mud. After the third ploughing the field is harrowed, the little embankments, a few inches high, intended to retain the water,

are repaired, and if the fields adjoin the road or the village site they are fenced in with split bamboo. When the seedlings are about seven or eight weeks old, they are taken from the nursery bed and carried in large bundles (*gosa*) to the field. Here they are planted out in handfuls, each of which contains four or five plants. The distance at which these are planted from one another depends upon the fertility of the soil, and the time of year at which the work is done. If the plants are transplanted early in the season, they can be placed at intervals of two feet, but later on the distance is reduced to nine inches. It is not unfrequently the practice to steep the young plants in water before they are planted out, and if they seem too luxuriant, the tops are cut off when they are removed from the nursery.

Transplanting goes on from the beginning of July to the middle of September, and is generally carried out by women. The work is of a most arduous description, and involves stooping for hours in a field of liquid mud, under the rays of a burning tropical sun. Before the end of the rains the crop is fully grown, though the ears are still empty, but about the beginning of October they begin to fill, and the field to turn to a rich yellow. From the middle of November to the middle of January, harvesting is going on. The women grasp a handful of the ears and cut them off about 8 inches below the head. These handfuls (*muthi*) are tied up with a piece of straw and left in the field for a few days to dry. When the grain is ready to be transported to the granary the *muthis* are made into larger sheaves. Six to eight *muthis*

form a *thor* or *jhap*, and five or six *thors* a *dangari*. A *dangari* is then affixed to either end of a sharp pointed bamboo called *biriya*, and the load, which is called a *bhar* and carried across the shoulder, is taken to the home-stead by the men.

The different kinds of *sali* dhan fall under two main divisions *sali* proper, which is generally known as *bar* in other districts, and *lahi*. *Lahi* ripens earlier than *sali* and, though the grain is of a finer quality, the yield is appreciably smaller. It is planted on the higher fields which dry up first at the conclusion of the rains, and are thus not fit for *sali*. Very little *sali* dhan is grown in the *chapari* near the Brahmaputra, *i.e.*, in the mauzas of Mayang, Gerua Bokani, Ghugua, and Juria, though in Dhing and Barbhagia there is a considerable area under this variety of rice.

Bao dhan is sown broadcast about the end of March, *Bao dhan.* the field having been previously prepared by four or five ploughings. It is grown in flooded tracts and the embankments made between the fields are smaller than in the case of *sali*, and are sometimes dispensed with altogether. It ripens about the beginning of November and is harvested in the same way as *sali*. *Bao* dhan is generally sown in the intermediate tract which lies too low for the growth of *sali*, but is not so much exposed to flood as the riparian flats. Mikir-bheta and Hatichong are the two mauzas in which most *bao* is grown, but it is also sown in the higher parts of the *chapari* near the Brahmaputra. East and south of the Kalang there is very little *bao*.

Ahu dhan.

**Two kinds of
place where
ahu grown.**

Ahu dhan is usually sown broadcast, and is grown under two different sets of conditions. The greater part of the *ahu* raised is sown on the *chapolis* which fringe the Brahmaputra, and in the Gerua Bokani mauza, there are over 7,000 acres under this kind of rice. The usual procedure is as follows. In May the jungle is cut down and burnt, and the land left till towards the end of the rains. The jungle, that has sprung up in the interval is cleared in the same way, the process being known as *gojola kata*, and ploughing begins in January. The field is ploughed three times and harrowed, and the clods are broken up by a mallet. Another ploughing and harrowing follow, the seed is sown and the land again ploughed and harrowed to ensure that the grain becomes thoroughly mixed with the soil. When the plants are about six inches high, and catch the wind (*botah boloah*), they are harrowed again and weeded, and finally harvested about the middle of July. The crop is, however, a precarious one and is liable to be destroyed by a sudden rise of the river. The plants can live under water for as much as a week, but if after this time the floods do not retire they are permanently destroyed. *Ahu* is generally grown on the *chapolis* in conjunction with mustard, and no jungle cutting is of course required when the soil has been already cleared for the oil seed crop. The same field is seldom cropped for more than three years in succession. The weeds which were unable to find a lodging under the dense growth of *ikra* (*saccharum arundinaceum*), *khagari* (*saccharum spontaneum*).

and *nal* (*phragmites roxburghii*), with which the land in its natural state is covered, soon spring up when once the jungle has been cleared and after the third year, it is less trouble to burn fresh jungle than to clear the old fields of weeds, while by a change of site, the peasant gets the further advantage of the manure of ashes for his next year's crop. *Ahu* is sometimes sown in conjunction with *bao*, in the hope that if the earlier crop is destroyed, the longer stemmed and sturdier *bao* may at any rate survive. It is also sown on high land near the village site, again in conjunction with mustard. The soil is poor, but is manured with the sweepings of the courtyard and the cowshed.

Ahu is also occasionally transplanted, the system of cultivation employed being substantially the same as that in force for *sali*. It is sown about the middle of May, transplanted some six weeks later and reaped about the end of October. Transplanted *ahu* is generally grown on irrigated land, and is most commonly found in mauzas Bamuni, Kandali, Kathiatali and Kampur. The crop ripens earlier than *sali* and thus gives a quicker return on the labour expended in its production.

Mustard, as has already been said, is usually grown ~~Mustard.~~ in conjunction with *ahu* on the riparian flats. The jungle is cut down in February and March, and if the land cannot be prepared in time for summer rice, is allowed to rot upon the ground. What remains is burned in October, the stumps dug out, and the land is ploughed over four or five times. The seed is sown about the end of October and the plant is ready to be

pulled from the field about the middle of January. It is generally left to dry for a few days and is then tied in bundles, and carried to the homestead, where it is threshed out by the cattle.

Nearly one-third of the total mustard crop of the district is raised in the three mauzas of Mayang, Gerua Bokani, and Dhing, but the whole of the country lying between the Kalang and the Brahmaputra is a mustard growing tract. South and east of the Kalang, the area under this plant is inconsiderable.

Pulses.

Pulse is usually grown on the alluvial flats that fringe the Brahmaputra in conjunction with summer rice and mustard, but a crop is often taken from the land on which rice seedlings, early rice, and sugarcane have been grown, as it is generally and rightly thought to improve the quality of the soil. In the *chaparis* if new land is taken up the first proceeding is to cut and burn the reeds and grass. Only two ploughings are required, and those are of the very lightest character, and, if the ground is naturally clear of jungle, the seed is sometimes simply sown on the river flats as soon as the floods subside. Pulse is also scattered broadcast amongst the rice stubble, or between the *sali* plants, if the land is still soft, but this method is not generally in use. The seed is sown in September and the crop is ripe about four months later. The plants are pulled up by the roots, left for a few days in the field to dry, and are then collected at the convenience of the cultivators. The seeds are threshed out by cattle, but as the grains do not separate readily from the pods, their

efforts are supplemented by a man armed with a bamboo staff. Several different kinds of pulse are grown but nine-tenths of the crop belong to the variety known as *mati-mah* (*phaseolus mungo radiatus*). Other kinds are *magu-mah* (*phaseolus mungo linn*), a species which has a smaller yield and requires more careful cultivation, but commands a higher price and possesses a more delicate flavour. It is seldom grown except on the river *chaparis*. *Kala-mah* (*lathyrus sativus*) is grown but not in any considerable quantities. It has a large yield but does not fetch a high price. Another variety is the lentil *masur-mah* (*lens esculenta*) which is also grown on *chapari* land.

Jute is grown in small patches as a garden crop Fibre. The plants are cut in August and September, stripped of their leaves, tied in bundles and left to rot in pools of water for from seven to twelve days. When they are ready a handful of stems is taken up, broken in the middle, and beaten to and fro in the water, till the inner part drops out and only the fibre remains. The bundles of fibre are then dried and are ready for use. Small patches of rhea (*bœhmeria nivea*) are grown in the gardens of the fishing castes, where they are heavily manured. The skin is stripped off from the stem and the fibre separated from the outer covering. The thread obtained is exceptionally strong and durable but the difficulty of decortication has hitherto prevented the growth of rhea on a commercial scale.

Cotton is grown by the Mikirs in the hills and is of two varieties. The large balled high growing cotton is

known as *bor kapah* (*gossypium neglectum*) while the smaller round balled species is termed *horu kapah* (*gossypium herbaceum*). The former is sown on level ground, has a comparatively small number of seeds, can be ginned more easily than the second variety, can be plucked twice a year, and bears for three seasons.

The *horu kapah* on the other hand yields only one crop in the year. Cotton is generally grown on hill sides covered with young saplings, which are cut during the cold weather, allowed to dry on the ground, and burnt in March or April. The ground is then hoed up, and the seed sown broadcast, generally in conjunction with that of other crops such as rice, *til*, maize chillies, mustard, or melons. The field is weeded, once or twice, and the crop ripens in November. Cotton requires rain when it is put into the ground to enable the seed to germinate, but afterwards it thrives best if it gets a good deal of sun, and heavy rain is liable to rot the stems. The average yield is about 150 lbs. per acre, and the produce is generally sold unginned, as the cost of labour is heavy in Nowgong and there is little demand locally for the seed. Most of the cotton grown in the district is raised in the Mikir Hills where it is estimated that there are about 3,000 acres under this plant.

Storage and
threshing of
grain.

The grain is usually stored as it is brought from the field in an out-house called *bhoral*. When it is required for use the sheaves are untied and spread over the courtyard. Cattle are then driven round and round over the heap of grain and straw, till the ears have been

finally separated from the stalk.* The grain is next passed through a sieve, and placed in a flat bamboo tray called *kula*. It is then jerked into the air and allowed to fall back into the tray, or held aloft and allowed to fall slowly to the ground, till gradually the chaff is carried off. After threshing the paddy is stored in huge drums, called *duli* or *mar*. They are made of split bamboo, and the outer surface is plastered over with clay and cowdung.

The agricultural implements in use are of a very simple character. The plough is usually made of the jack fruit tree or some other hard wood, and consists of three parts—the handle and body which are usually all in one piece, the pole which joins the plough at the junction of the handle and the body, and the yoke which is merely a piece of wood, fastened by rope at right angles to the pole, with pegs affixed to it to keep it from sliding from the necks of the bullocks. The front portion of the body is sharpened to a point which is shod with iron, and in soft soil a piece of bamboo is sometimes substituted for the iron. This piece of iron is the only portion of the plough which the farmer has to purchase. The rest he makes for himself. The whole instrument is suited to the wretched class of animal required to draw it. It weighs as a rule about 20 lbs and, when cattle are used, the yoke seldom stands as much as 36 inches from the ground. When buffaloes are employed, the whole plough is constructed on a

Agricultural
implements.
The plough

* An experiment made by Mr. Darrah, D. L. R. and A. showed that nine bullocks took 2 hours and 8 minutes only to thresh out $7\frac{1}{2}$ maunds of paddy.

larger scale. It is obvious that such an implement can only penetrate from three to four inches into the soil, but the wretched quality of the plough cattle prohibits the use of a more effective instrument.

**Other imple-
ments.**

The harrow (*moi*) is generally a bamboo ladder, about eight feet in length, on which a man stands as it is drawn across the field. It is used to crush the clods turned up by the plough before mustard or summer rice is sown, and to reduce the fields required for wet rice to puddle. Its place is sometimes taken by a plain log of wood. It is prepared by the cultivator himself from the bamboos growing in his garden. Clods are broken by a mallet (*dheli mari*) which is also made at home. Hoes (*kodalis*) are used to trim the embankments (*alis*) which help to retain the water. The head is bought in the bazar, and costs from Re. 1 to Re. 1-4, and is fitted with a shaft by the farmer himself. Sickles, with which the rice is reaped, have also to be purchased and cost from two to four annas. In *ahu* cultivation, a large wooden rake (*bindha*) with teeth nearly one foot in length, is dragged over the crop by a bullock when the plants are about six inches high. The *nirani*, a kind of trowel with a long handle, is used for weeding *ahu* rice. The sugarcane mill is described in the paragraph dealing with the preparation of molasses. The ordinary implement used for husking grain is the *dheki*, a long beam with a pestle affixed at the end, which is supported by two posts at about two-thirds of the length from the head. The shorter end is depressed by the foot, and the pestle is thus raised into the air; the weight is then

removed, and the pestle falls into a small hole, in a piece of wood which has been sunk level with the ground, in which the grain is placed. The *dheki* is the implement ordinarily employed by the Assamese to husk their rice or pulse but the animistic tribes generally use a large wooden mortar (*ural*) and a pestle (*muri*). All of these implements are made at home.

Sugarcane (*saccharum officinarum*) is usually grown Sugarcane. on high land near the village site, and as the soil is poor, it has to be well manured with cowdung. The crop is propagated from the tops of the best canes, which are cut off at harvest time and kept in a shady place. One of these tops yields on the average about five canes, and as they contain but little juice, the cultivator does not sacrifice much of the gross product of his fields in the cause of reproduction. Four principal varieties of the plant are recognised. The *bagi* or white stands about seven feet high and has yellow canes of a soft juicy texture. The *teli* is shorter, harder, and thinner, and the canes are of a deep red or even purple colour. The *Bangali*, a foreign variety, is larger and more juicy than the indigenous kinds, but yields a smaller proportion of sugar. The *malaka* is a hard and thin variety of the *mugi*, and, where grown, is planted round the edge of the field. The land is hoed up till it is reduced to a fine tilth, and the tops planted in trenches between April and June. The patch is fenced with split bamboo, and there is usually a stout hedge of arhar dal (*cajanus indicus*), but constant watching is required to scare away jackals and other animals,

and an empty oil tin with a clapper is generally to be seen suspended over each field. While the crop is growing it is continually hoed and weeded, and about August the leaves should be tied up round each cluster of canes, which is a troublesome proceeding. The earth from the ridges is heaped about the roots to strengthen their hold upon the soil, and this process is continued until the relative positions of ridge and trench are reversed, and the canes stand upon ridges with the trenches in between. Harvesting goes on from January to April, and during the winter nights and in the foggy mornings the drone of the sugarcane mill is heard coming across the fields in nearly every part of the Assam Valley where the "works of men" are to be seen.

**Preparation
of molasses.**

The native form of mill is still generally used for the extraction of the juice. It consists of two wooden rollers, fixed side by side in a trough hollowed out of a heavy block of wood. The tops of the two rollers pass through a hollow beam, supported by uprights let through the lower block of wood into the ground, and are cut into the form of screws which fit into one another. To the larger of the two (*mota bhim* as distinguished from *maiki bhim*) is affixed a pole, which is driven round in a circle, and thus causes the rollers to revolve. The motive power is usually supplied by the villagers themselves, but buffaloes are occasionally used for the work. The mill requires rather more knowledge of carpentry for its production than the other implements of agriculture, and can only be made by the more skillful of the villagers. The cane is placed between the

rollers and crushed as it is slowly forced through. Each handful is passed through the mill three or four times, till nothing but foam appears. The juice trickles from the trough into an earthen vessel, and is then transferred to a small boat scooped out of a log. When twelve or fifteen gallons have been collected, boiling begins. The furnace is hollowed out of the ground, and has four circular openings to receive the cauldrons, which are made of the most durable kinds of potters' clay. Two of these vessels are placed about 9 feet from the furnace's mouth, and only serve to heat the juice before it is transferred into the other vessels to be boiled. When the juice has been reduced to the proper condition, it is ladled into a wooden vessel (*gholani*) shaped like a small dug-out, and is stirred for half an hour. As the stirring continues, the liquid loses its dark brown colour, and assumes the consistency and hue of yellow mud. It is then stored in earthen pots and the process is complete.

The fertility of the rice fields mainly depends upon the following five causes: the water supply, the quality of the soil, and the liability to injury from flood, wild animals, or shade. But the first named factor is probably of most importance. The soil of the district varies from pure sand near the Brahmaputra to clay so stiff as to be utterly unfit for cultivation. The land best suited for the growth of rice is a clay loam *alatia*, the most fertile variety of which is called *bherbheria*, and is particularly deep and soft. *Bherbheria* land is found at the lowest part of the rice basins, and is enriched by the drainage

Causes
affecting
productive-
ness of land.

from the village site. The animals which do most injury to the crop are pigs, elephants, and monkeys. Elephants leave disastrous traces of their presence, but luckily do not remain long in any one locality, and are generally only found in the *chapari*, and in the Bangkhang, Duar Salana, Jorabahi, Garubat and Jamunamukh mauzas. Serious damage is sometimes done by insects which are called *keonkata*, *tupalia*, *gandhi* (*leptocorisa acuta*) and *chara* (*hispa acusceus*). The *gandhi* is a small bug, which injures the rice plant by feeding on the stems and sucking all the sap from the young grains. It is most prevalent in July and August, and is particularly in evidence during a spell of hot dry weather. High wind and rain drive it back into the jungle, and good results are obtained by lighting fires of vegetable refuse to windward. The best remedy of all is to collect the insects by smearing a winnowing fan with some glutinous substance and pushing it over the ears of grain, when many of the bugs will be found adhering to the fan. This remedy should be tried in the morning or late afternoon, as the insects do not feed in the heat of the day. The *chara* is a tiny beetle, which eats away the outer surface of the leaves and stalks and thus affects the outturn of the crops. It attacks the young plants in the nursery and can most easily be destroyed there by spraying*. Smoking the fields also produces good results, but must be continued for some days or the beetles will return. Rain is wanted when *sali* rice

* The best solution is 1 lb. Paris Green, 1 lb freshly slaked lime or flour and 150-gallons water. The solution should be kept constantly stirred and should be sprayed on with a fine sprayer.

is sown and is transplanted but is not needed for the sowing of *ahu* and *baq*. Sir W. Hunter† reports that about 1822 there was a wholesale destruction of the harvest by locusts, and that the price of paddy rose to the enormous height of Rs. 8 per maund. Locusts re-appeared in 1840 and sent up the price to Rs. 3-5-0 per maund, and in 1858 the visitations of other insects as well as locusts sent paddy up to Rs. 2-10-0 a maund. The authority for these statements is not quoted, and at the present day, Nowgong does not appear to be in any way specially liable to blight. The troubled condition of the country in 1822 would in itself be sufficient to account for the high price of grain. During every stage of its growth the plant is benefitted by moderate showers, but rain is absolutely essential at the time when the ears are first appearing. Hail storms in December sometimes lay the crop and add materially to the cost of reaping, but fortunately are very local in their action.

One of the most valuable of garden crops is the plantain (*musca sapientum*). As many as ten main varieties of this tree are recognized, but the most important are those known as *athia*, *monohar*, *cheni champa*, and *malbhog*. The first two groups are again subdivided into a considerable number of different species. The commonest form of *athia* is called *bhim*, a large tree which is found growing in the garden of nearly every house. The fruit is considered cool and wholesome, and is very generally used as food for infants. The *monohar* is a somewhat

Garden
crops.
The plantain

† Statistical Account of Assam, Vol. I, P. 197.

smaller tree ; the pulp of the fruit is white and slightly acid in taste, and is largely used in combination with soft rice and milk at village feasts. The *malbhog* and *cheni champa* are small trees, whose fruit is much appreciated by Europeans. The *athia* plantain is generally grown near the homestead where it can obtain a plentiful supply of manure ; but the finer varieties are planted at a little distance to protect them from the earthworms, whose attacks they are hardly strong enough to resist. Sandy soil and heavy clay check the growth of the plant, and anything in the shape of waterlogging is most injurious. The trees are planted in holes about a foot wide and eighteen inches deep and are manured with cowdung, ashes and sweepings. Young saplings take from eighteen months to two years to flower, and the flowers take from three to six months to turn into fruit. The plantain tree plays many parts in addition to that of fruit purveyor. The flower is much esteemed as a vegetable, the leaves serve as plates, and the trunks are used for decorative purposes on occasions of ceremony, and as food for elephants. An alkaline solution, distilled from the sheaths and the corm, is often used in place of salt. These portions of the tree are sliced, dried, and reduced to ashes. The ashes are placed in an earthen pot, in which there are several holes lightly plugged with straw. Water is then poured over them, which dissolves the alkali and trickles through the holes into the receiver below. The resulting product, which is known as *kharpani*, is used as a relish, as a hair wash, and as a mordant with certain dyes.

The betel nut (*areca catechu*) is grown almost as ^{Other garden crops.} universally as the plantain, and, with the bamboo, forms the great trinity of trees in which the houses of the Assamese are usually embedded. The plantation is hoed up, and kept clear of weeds, and the trees are most liberally manured with cowdung. The pan vine (*piper betle*) is frequently trained up their stems, and the leaf and nut, which are invariably eaten in conjunction, are thus grown side by side. Tobacco is a plant which is to be seen growing in the majority of gardens. The seedlings are raised in carefully manured beds in August and September. At the beginning of November they are transplanted into ground which has been reduced to a fine tilth, watered for a few days, and protected from the sun by little sections of the plantain trunk. The bed is lightly hoed up two or three times and not more than ten or twelve leaves are allowed to grow on each plant, the remainder being picked off as they appear. The leaves are first gathered in February and March, and there is a second, but much inferior crop about two months later. If required for chewing, they are either dried under a shed, or else pressed into a hollow bamboo (*chunga*) and allowed to ferment. When the tobacco is destined for the pipe, though this is not the use to which it is generally put, the leaves are piled up in heaps till they ferment, cut up and mixed with molasses, and then are ready for the hookah. The commonest forms of vegetable grown are, spinach *pui* (*basella alba*), *lahi*, a species of *brassica*, different kinds of arums (*kachu*), different kinds of yams (*dioscorea*) and gourds, the country bean *urahi* (*dolichos*

lablab), the common mallow *lafa* (*malva verticillata*), the radish *mula* (*raphanus sativus*), the sorrel *chuka say* (*rumex vesicarius*) and the brinjal (*solanum melongena*).

Yield and
value of
crops.

The outturn of different crops varies according to the character of the season, and also to a great extent according to the character and level of the soil on which they are grown.

		lbs.	yield per acre laid down by the
Sali	...	1,000	Agricultural Department after a
Ahu	...	800	long series of experiments. These
Bao	...	700	figures only represent a general
Mustard	...	550	mean and even in a normal year,
Molasses	...	1,800	

there are many fields whose outturn varies largely from the average. The yield of rice, it may be premised, is expressed in terms of husked grain. Like the outturn, the cash value of the crop can only be approximately ascertained. The prices obtained by the raiyats vary to some extent in different parts of the district, but probably average about Rs. 1-4 to 1-8 per maund of unhusked grain. Assuming that unhusked paddy yields 62 per cent. of clean rice, it would appear that the value of the harvest from an acre of *sali* is between 25 and 30 rupees, from one of *bao* between Rs. 17 and Rs. 21, and from one of *ahu* between Rs. 20 and Rs. 24. For mustard the villagers generally get from Rs. 2-8 to Rs. 3 a maund, so that the yield from one acre is worth from 17 to 20 rupees. The price of molasses varies considerably from time to time and from place to place and ranges from Rs. 5 to Rs. 7-8-0 per maund.

The value of the yield of an acre of cane ranges accordingly from Rs. 110 to Rs. 165.

In many parts of Nowgong floods are a serious ob- **Floods.**
stacle to agriculture. The mauzas near the Brahmaputra are inundated in the rains, but this is merely one of the ordinary incidents of life, and the villagers overcome this difficulty by growing summer rice, which, if they are lucky, will be reaped before the floods are at their highest, and mustard which is sown after the waters fall. Further south the Kalang often overflows its banks after heavy rain and does some damage, while the Kapili and its tributaries are especially troublesome as they are liable to come down in strong and sudden freshets from the hills. It would be a difficult matter to regulate these rivers by protective works, and the population of the district is so sparse that no attempt has yet been made to reclaim any of the inundated tracts for permanent cultivation. The remains of embankments constructed in the days of native rule, are to be found in the Barbhagia and Juria mauzas and the Dhing road is said to afford some protection to the land lying on the west, but the time is not yet ripe for the construction of embankments on an extensive scale.

There are no great irrigation works in Nowgong, **Irrigation and attempts to improve the system of cultivation.**
or for the matter of that in any other part of the Province, and no attempt is made to water the crops from wells, but near the hills the people grow rice on high land above the reach of flood and bring the water of the hill streams through little channels on to their fields. These channels are constructed and

repaired by the villagers themselves, and are to be seen in the Kandali, Kathiatali, Duar Bagari, Bhatialgaon, Barbhagia, Bhelenguri, Chalchali, Namati, Jamunamukh, Rangkhong, Sahari, Uttarkhola, and Garubat mauzas. But they are not very numerous or very elaborate feats of engineering, and over the greater part of the district the aim of the cultivator is rather to protect his fields from flood than to attract the water to them. Manure is very seldom used, except for sugarcane and vegetables for which coudung and sweepings are employed, but land covered with jungle is of course fertilized by the ashes of the reeds standing on it. Little attempt has been made to introduce new crops, or to improve the existing staples except in so far as this is done by reserving the largest ears to act as seed, but in Kampur the cultivation of peas, wheat, and jute is said to be extending in the neighbourhood of the railway.

Live stock.
Buffaloes.

The buffaloes of the district belong to two distinct breeds, the Assamese and the Bengali.* The Assamese are the larger of the two and are fine upstanding animals with widely spreading horns. During the cold weather, they are generally grazed in jungly tracts and a wild bull often attaches himself to the herd, and becomes the sire of many of the calves. This continual infusion of a good strain of blood does much to maintain the excellence of the breed. The Bengali buffalo is a smaller and less imposing animal, and does not command so high a price, a bull

* The information given in these paragraphs is taken from a note compiled by Mr Darrah, Director of Land Records and Agriculture in 1887 and from reports received from the tahsildars and mauzadars in Nowgong.

costing from Rs. 25 to Rs. 30 and a cow from Rs. 30 to Rs. 40. The price of the Assamese buffalo varies considerably in different portions of the district. Near the Brahmaputra, where large herds of these animals are kept by professional graziers, the bull fetches from Rs. 30 to Rs. 40, the cow from Rs. 40 to Rs. 60, but in the Kapili valley the price rises to Rs. 40 to Rs. 60 for a bull and to Rs. 60 to 85 for a cow. Buffaloes rarely get anything but grass and a little salt to eat. In the cultivated portions of the district they are usually placed in charge of a small half naked boy whose legs can hardly stretch across the massive back of the animal he bestrides, and who guides it with a nose-rope. In the *chaparis* the herd is driven out to graze in the jungle, and follows the lead of the older cows, whose whereabouts is indicated by the metal or wooden bells that are dangling from their necks. They are often trusted to return in the evening of their own accord, and a long line of animals is sometimes to be seen swimming across a channel of the Brahmaputra, which separates them from the huts in which the graziers live. Often too, as the sun is setting, a herdsman is to be seen climbing a *simul* tree, which raises its head above the surrounding wastes of grass, to call his buffaloes home. At night each animal is fastened by a nose-rope to a post, and sleeps on the bare ground. A cow generally remains in milk for about ten months, and yields at the beginning from two to four seers every day. The amount gradually decreases till a month or so before the next calf comes when it ceases altogether.

The milk is very white and rich in fatty materials, and consequently yields a large proportion of *ghi*. The cows are said to begin breeding when three years old, and to continue doing so for fifteen years; during which time they give birth, on the average, to about ten calves. The normal life of a buffalo is from 25 to 30 years.

Cattle.

Half starved, undersized, ill-bred, and not unfrequently diseased, the Assamese cattle are but sorry creatures. The bullocks find it a difficult task to drag even the light native plough, and the cows yield but a minimum of milk. The causes of this degeneracy are not entirely clear, but are probably to be found in a total indifference to laws of breeding, in absolute neglect, and partly perhaps in the want of suitable fodder in the rains. No bulls are set aside to be the sires of the herd, and the cows are generally covered by a young and immature animal, who secures the object of his desires by his superior lightness and agility. The sire is often closely related to the dam and she, in her turn, has had her strength exhausted by being covered, when herself little more than a calf, and by subsequent breeding without the smallest intermission. The cattle are never groomed, and, when an epidemic breaks out no attempt is made to isolate the sick. "Everything," as Mr. Darrah says, "is left to nature, from the moment when the most active, and therefore probably the youngest bull of the herd has succeeded in covering a cow, until the progeny, after years of work and semi-starvation, dies neglected in some unfrequented jungle." If nasty, they have, at any rate, the merit

of being cheap and cows cost from Rs. 7 to Rs. 12, and bullocks, which are usually castrated when three years old, from Rs. 15 to Rs. 30.

In the cold weather there is generally plenty of grazing ground, and the animals are turned loose in the rice fields, or are driven away to swamps which are often covered with the most luxuriant grass. In the rains, when most of the country goes under water, fodder is not so easily obtained, and the cattle have to pick up a living as best they can on the high ground between the rice fields, and are stall fed on grass, and, in the more densely populated portions of the district, on straw. The difficulty becomes particularly acute in the *chapari mahals*, and in Gerua mauza they are said to be kept on artificial mounds of earth, which are thrown up near the homestead. On the other hand in the cold weather there is abundance of excellent grazing on the *chapari*, and in the six mauzas that fringe the Brahmaputra from Pubtharia to Mayang there were in 1903 no less than 42 separate *mokhutis*, or herds of buffaloes kept by professional graziers, the great majority of whom are Nepalese. Graziers are also fairly numerous in the tahsils, and there were 14 *mokhutis* both in the Raha and the *sadr* tahsil, and 9 in Samaguri. On the other hand in the Kapili valley, above its junction with the Jamuna, the professional grazer is unknown. This no doubt is due to the fact that the population is so sparse that there could be but little sale for milk, as in this portion of the district there is an abundance of good grazing ground, and the

cattle of the Kapili valley are said to be some of the finest in Assam.

**Goats and
sheep and
ponies.**

The goats are almost as degenerate as the cattle. They yield but little milk, the whole of which is taken by the kids, and are only kept for food or sacrifice. At night they are usually shut up in a small out-house with a raised floor, which is approached by a slanting board or sloping bamboo platform. There is no indigenous breed of sheep, and the animals imported do not thrive. The total number in the district is extremely small. The country ponies are, if anything, even more miserable specimens than the cattle. Few of them are as much as twelve hands in height, and they possess neither pace, endurance nor stamina. A census of the live stock in the district was taken in 1904, and disclosed the following results. Bull buffaloes 8,100 ; cow buffaloes 8,200 ; bulls and bullocks 69,900 ; cows 56,000 ; young stock 72,200 ; goats 31,000 ; sheep 213 ; horses and ponies 516. A fine breed of black swine are also kept by the animistic tribes.

**Cattle
disease.**

The most common forms of cattle disease prevalent in Nowgong are foot and mouth disease, rinderpest (*guti*), a disease called *kachua*, the principal symptoms of which are flatulence and diarrhoea (*marki*), cholera, *matikhoa* the first symptom of which is, as the name implies, the eating of earth followed by dysentery, and *sukuna* when the animal refuses to eat and dies after ten days or a fortnight.

The indigenous tea of Assam was first brought to the notice of Government in 1826 by Mr. C. A. Bruce, a gentleman who had traded in the Province in the time of the Ahom Rajas, and who had been sent up the Brahmaputra in command of a division of gun boats in 1824. In 1834 a committee was appointed by Government to enquire into the possibility of cultivating tea on a commercial scale, who deputed three of their members—Drs. Wallich, McClelland, and Griffiths to visit Upper Assam. Nurseries were opened for the plant, a small establishment was entertained, under the general management of Mr. Bruce, to search the jungles for plots of indigenous tea and cultivate them when discovered, and plants and seed were brought to Assam from China. Tea makers and trained Chinese were imported in 1837, and, in the following year, some of the manufactured product was sent to England, where it met with a most favourable reception. Assam tea was regarded as a curiosity, and the first eight chests which were put up to auction fetched sums which, at the present day, seem little short of fabulous, the prices paid ranging from 16 *s.* to £1-14-0 a pound. These were, however, only fancy prices, and a short time afterwards a merchant offered to purchase tea in considerable quantities at prices ranging from 1*s.* 10½*d.*, to 2*s.* a lb.

Tea: commencement of the industry.*

* Information with regard to the early history of the tea industry has been derived from

1. Selections from the Records of the Government of Bengal, No. XXXVII. Papers relating to Tea Cultivation in Assam. Calcutta, 1861.
2. Report of the Commissioners appointed to enquire into the state and prospects of Tea cultivation in Assam, Cachar and Sylhet. Calcutta, 1868.
3. Papers regarding the Tea Industry in Bengal. Calcutta, 1873.

**Tea in
Nowgong.**

Nowgong was, however, one of the last districts of the Assam Valley to attract the attention of the planter. In 1859, no tea was manufactured west of the Mikir Hills, and even the area planted out was not recorded. In 1872, the total area under mature plant was said to be 1,278 acres which yielded 363,000 lbs. of manufactured tea. Then ensued a period of some expansion and by 1882 the total area under plant both mature and immature had risen to 9,945 acres and the yield to 3,253,000 lbs. of manufactured tea. But the district continued to be unpopular in planting circles. During the last twenty years of the nineteenth century the tea industry in Tezpur, Sibsagar, and Lakhimpur advanced by leaps and bounds, but in Nowgong it made little progress. In 1900, there were only 12,673 acres under plant which yielded 4,330,000 lbs. of the manufactured article or a little more than one-seventh of the total outturn of the Sibsagar district. Statistics for later years will be found in Table VI. Most of the gardens are situated near the western slopes of the Mikir Hills, stretching from a point east of Nowgong town towards the Brahmaputra. Details for each garden will be found in statement A in the Appendix.

**Labour
force.**

The industry is for the most part worked with imported labour, and in the ten years ending with 1890, 18,837 coolies were brought up to the plantations. The importations in the next decade were 25,610 the largest number (5,320) arriving in 1897, when famine was raging in the recruiting districts. Details for later years will be found in Table VI.

The abstract in the margin shows the areas from			which the labour force in

The journey from the recruiting districts is troublesome and expensive, the class of persons capable of working successfully in the damp climate of Assam is limited, and of recent years the supply of labour available has not been sufficient to satisfy the requirements of the planters. Special Acts have been passed to regulate the relations between the employers and their labour force. Careful provision is made for the welfare of the coolie. He is housed in neat and comfortable lines, usually far superior to the dwellings occupied by persons of that class outside the gardens, he is provided with an excellent water supply, generally drawn from masonry wells, and when sick he is cared for in a comfortable hospital by a native doctor working under the supervision of a European medical man. The provision of all these comforts and the importation of the labourers themselves cost large sums of money, which no one would be willing to expend without some guarantee that the coolies, when imported, would consent to remain on the plantation. This protection is afforded by the law, (Act VI of 1901) which lays down that a labourer, provided that he is

well-treated, must not leave the garden to which he is indentured before the expiry of his contract, unless he chooses to redeem it by a money payment.

Soil.

A friable red loam is the soil that proves most suitable for tea. The plant requires a heavy rainfall, but anything in the shape of water-logging is most prejudicial to its growth, and gardens should only be planted out on land which can be well drained. Land which, in its natural state, is covered with tree forest is usually considered the most suitable, as the absence of timber generally shows, either that the place is liable to flood, or that the soil is sandy, or that the rainfall is deficient.

Varieties of plant.

Four distinct varieties of wild tea are recognised: Assam indigenous, which has a leaf from 6 to $7\frac{3}{4}$ inches in length by $2\frac{3}{8}$ to $2\frac{7}{8}$ inches in width; the Manipur or Burma indigenous with a larger, darker, and coarser leaf than the preceding variety; Lushai or Cachar indigenous, whose mature leaf is from 12 to 14 inches long, and from 6 to $7\frac{1}{2}$ inches wide; and the Naga indigenous which has a long and narrow leaf. In addition to these four varieties there is the China plant, and different kinds of hybrids. The China tea is a squat and bushy shrub with small leaves, which gives a lower yield per acre than the other kinds. It is many years since China seed was planted out in new clearances, and considerable areas covered by this plant have been abandoned. In its natural state the indigenous plant attains to the dimensions of a tree, varying from 20 to 50 feet in height, though its girth seldom

exceeds two feet. It has a vigorous growth and yields a large outturn of fine flavoured tea, but is delicate when young. Of the hybrid variety there are many qualities ranging from nearly pure indigenous to nearly pure China. A plant with a very small admixture of China is usually preferred, as this imparts the hardiness, the want of which is the one defect in the indigenous variety.

The seed is planted in nursery beds in December and January and kept under shade till the young plants are three or four inches above the ground. Transplanting goes on between April and July, whenever there is rain, the plants being usually placed from four to five feet apart. During the first two years of their life little more is required than to keep the plantation cleared of weeds. By this time the plants are from two to four feet high, and at the end of the rains, they are pruned down to fifteen inches or a foot to encourage lateral growth. In the third year the plant can be lightly plucked over, but the yield of leaf is small. Pruning is continued every year, only about two inches are left of the wood formed since the previous pruning, and any unhealthy or stunted branches removed. As an extreme remedy old plants, in which there is a large proportion of gnarled and twisted wood, are sawn off level with the ground, and fresh shoots are allowed to spring from the root itself. During the rains the garden is hoed over several times, in order to render the soil permeable both to rain water and the roots of the bush. At the end of the rains the ground is

System of
cultivation.

hoed up to the depth of 8 or 9 inches. The object of this is to protect the land from drought, the hoed-up soil prevents the evaporation of water from the lower strata. It also adds to the fertility of the land by exposing it to air, light, and changes of temperature. Manure has hitherto been little used. Oil cake and cowdung are occasionally spread about the plants, and exhausted land is sometimes top dressed with rich soil from a neighbouring marsh. The cost of these operations is considerable, and they are not invariably successful from the pecuniary point of view.

Plucking begins in April, and is continued till the beginning of December. The bud and the two top leaves are taken from each shoot, but fresh leaves soon appear, and in about five weeks time the shoot is ready to be plucked again. This throwing out of new leaves is termed a "flush," and there are usually five or six full "flushes" in a season, though each bush is picked over every ten days or so, as the twigs develop at different times. The plucking is usually done by women and children, while the men are engaged in hoeing up the ground around the plants. The plant is liable to be attacked by a large number of pests, the best known being the tea mosquito or blight, the green fly, and the red spider. A full account of these pests will be found in "The pests and blights of the tea plant" by Watt and Mann, Calcutta, 1903.

**System of
manufacture**

When the leaf has been taken to the factory, it is spread out in thin layers on trays and allowed to wither. In fine weather the process takes about twenty hours,

but if it is cold and wet from thirty to forty hours may elapse before the leaf is ready. When the leaf has been properly withered it is placed in the rolling machines. The object of rolling is to break up the cellular matter and liberate the juices, and to give a twist to the leaf. Rolling takes about forty minutes, and after this the leaf is placed in a cool room for about three and a half hours to ferment. It is then placed on trays in the firing machines, through which hot air is driven, until the last trace of moisture has been expelled, and the tea is crisp to the touch. The leaf is then passed through sieves of varying degrees of fineness, and the tea sorted into different grades. The best and most expensive quality is called broken orange pekoe, and is made from the bud or tip, which contains all the good qualities of tea in a more concentrated form than any of the other leaves, is stronger, and has a more delicate flavour. The other grades, which are differentiated by the size of the mesh through which they pass are, orange pekoe, broken pekoe, pekoe, souchong and fannings. After the tea has been sorted it is fired once more to remove any moisture it may have absorbed from the surrounding atmosphere and is packed in lead lined boxes while it is still warm. Tea loses largely in weight during the process of manufacture, and about four pounds of green leaf are required to produce one pound of the finished article.

The character of the outturn depends largely upon the season, but still more upon the garden and the Outturn and prices.

system of manufacture followed. In 1868 the Commissioners estimated that the average outturn was about 240 lbs. per acre; but this estimate was probably too low, as the average yield in Nowgong during the five years ending with 1903 was 350 lbs. per acre. The introduction of machinery, and the improvement of the general system of cultivation and management, have rendered it possible to effect a large reduction, in the cost of the tea when placed upon the market. In 1868 it was calculated that tea must be sold at two shillings a lb. to yield a profit. Twenty years later the average price obtained by tea from the Brahmaputra Valley was 8 annas 2 pies, and, though in 1894 it rose to 10 annas 5 pies, in 1898 it dropped to 6 annas 9 pies, and has since remained below that figure.

Forests.

The forests of Nowgong fall into two main classes, the reserved forests, which in 1902-03 covered an area of 142 square miles, and the unclassified state forests, which in the same year occupied the enormous area of 3418 square miles. Unclassed state forest is however, simply Government waste land, and does not necessarily possess any of the characteristics which are usually associated with the expression forest. It may be a sandy *chur*, or a huge expanse of low-lying land covered with high grass and reeds and almost totally destitute of trees. It may be a small piece of arable land, which has been resigned by its former holder, and has not yet been settled with any other

person ; or it may be, what its name would naturally suggest, *i.e.*, actual tree forest. It is impossible to give even the roughest estimate of the proportion of unclassified state forest, which is actually under timber, but where the total area is so enormous it is obvious that, in a country with a heavy rainfall like Assam, the area covered with trees must be considerable.

The management of the Government reserves is usually entrusted to an extra Assistant Conservator of Forests, who has a sanctioned staff of two deputy rangers, one forester, and twenty-one head guards, and guards. Settlement holders are allowed to take from unclassified state forests, any forest produce required for home consumption other than live reserved trees, free of royalty. System of
management

Sonaru (*cassia fistula*), ajhar (*lagerstrœmia reginæ*) titasapa (*michelia champaca*), gunserai (*cinnamomum glanduliferum*) and gomari (*gmelina arborea*) are the most valuable trees found in unclassified state forests, the first four being used for the construction of dug-out canoes which are floated down the Kapili, Jamuna, and Barpani to Chaparmukh where they are purchased by traders from Goalpara and Gauhati.

From Table VIII it will be seen that the bulk of the timber sold in Nowgong is obtained from unclassified state forests, and that the reserves are hardly touched. The Diyu valley forest, which lies a few miles south-east of Kaliabar, is in fact, the only one from which any appreciable revenue is at present raised, and the remaining 134 square miles of reserved forest

only yielded a revenue of Rs. 883 in 1903. These forests are too remote to attract the Bengal trader, but now that the railway has been completed through the North Cachar Hills, it is possible that purchasers may come from the Surma Valley, where there is a brisk demand for timber. In addition to the trees already mentioned they contain sal (*shorea robusta*), sam (*artocarpus chaplasha*) poma (*cedrela toona*) nahor (*mesua ferrea* and koroï (*albizzia procera*). Details for each reserve will be found in Table VII. Minor articles of forest produce from which revenue is raised are bamboos, canes, rubber, lac, and agar (*aquilaria agallocha*), but the most important item of all are the fees levied on the professional graziers who herd their buffaloes in the jungles.

The expenditure incurred on forests in Nowgong is certainly not high, but as will be seen in Table VIII, it not unfrequently exceeds the revenue obtained.

CHAPTER V.

INDUSTRIES.

Industries—Silk—Weaving—Pottery—Brass and bell-metal—Lac—Mat-making—Fishing.

Apart from tea and the production of silk thread ^{Industries.} and lac, there are no industries of much commercial importance in Nowgong. In almost every house there is a loom, but the cotton cloth produced is generally required for home consumption, and is very seldom sold. A few up-country men express oil from mustard seed, using for the purpose the ordinary bullock mill of Upper India; and Bengalis, Mikirs and Kamars make daos, sickles and knives from imported iron. In the following paragraphs some account is given of such industries as exist.

Three different kinds of silk are produced in the ^{Pat silk.} district. The most valuable kind is known as *pat*, and is obtained from the cocoon of two species of worms, the univoltine or *bar polu* (*bombyx textor*) and the multivoltine or *saru polu* (*bombyx crasi*). Both kinds are reared indoors on the leaves of the mulberry tree (*morus indica*), or where mulberry is not obtainable, on the *panchapa*. The eggs of the *bar polu* take ten months to hatch, the worms usually making their appearance about the

beginning of January. The life of the worm lasts from thirty to forty days, and the cocoon takes about six days to spin. The cocoons are of a bright yellow colour, but the silk, when boiled in potash water, become perfectly white. From twelve to fifteen thousand cocoons are required to yield one pound of thread, which is worth from Rs 8 to Rs. 12. The thread obtained from the *saru polu* is not so valuable as that of the *bombyx textor*, but as the worm yields four broods in the year, it finds greater favour with the cultivators. *Pat* silk is, however, only made to order and the total quantity produced is very small.

Several causes combine to make this silk rare and expensive. The Jugis are the only caste who will consent to rear the worm, and, as the insect is looked upon as impure, the industry is probably regarded with disfavour even by the Jugis. The supply of mulberry leaf is limited, and the worms are very delicate, a large number of them dying before they spin.

Muga,

The *muga* worm (*antheræa assamæa*) is generally fed on the *sum* tree (*machilus odoratissima*). Five different broods are distinguished by vernacular names, but in the Nowgong district the only broods commonly reared are the *katia* in October—November, the *jarua* in December—February, and the *jethua* in the spring. The complete cycle of the insect lasts from 54 to 81 days, the bulk of which is occupied by the life of the worm. When the moths hatch out the females are at once attached to straws which are hung up inside the house, and are visited by the males who are allowed to

remain at liberty. Each female produces about 250 eggs, which are placed in a dark place, and when the worms appear, they are at once transferred to the *sum* tree. A band of straw or plantain leaves is fastened round the trunk to prevent them from descending, and during the night they take shelter under the leaves. Constant vigilance is, however, required to keep off crows, kites, owls, large bats and other pests which prey upon the worm, and hail and heavy rain not unfrequently do damage. When fully grown the worm is about 5 inches long and nearly as thick as the forefinger. In colour it is green with a brown and yellow stripe extending down each side, while red moles with bright gold bases are dotted about the surface of the body. When the worms are ready to spin they descend the tree and are then removed to the house. Most Assamese women possess one or more garments of *muga* silk, and well-to-do men wear waist cloths of this material on occasions of ceremony. *Muga* silk is chiefly manufactured for home use and very little is produced for sale. The principal centres of cultivation are at Barghat, Panigaon, Nanai, Jhagari, and Baropujia. The silk is reeled from the cocoon, 250 of which yield one ounce of thread. The price obtained is from 6 to 8 annas per ounce.

The *eri* worm (*attacus ricini*) derives its name from eri silk. the *eri* or castor oil plant (*ricinus communis*) on which it is usually fed. From five to six broods are usually reared in the year, those which spin their cocoons in November, February, and May yielding most silk. As

with the *muga* moth, the females, when they emerge, are tied to pieces of reed, and are visited by the males who are left at liberty. The eggs are hatched in the house and take from a week to 15 days to mature. As soon as the worms appear they are placed on a tray, which is suspended in a place of safety, and fed on the leaves of the castor oil plant. When fully grown they are about $3\frac{1}{2}$ inches long and of a dirty white or green colour. After the final moulting, the worms are transferred from the tray to forked twigs suspended across a piece of reed, and, when they are ready to spin, are placed on a bundle of dried plantain leaves or withered branches which is hung from the roof of the hut. The matrix of the cocoon is very gummy, and the silk, which is of a dirty white colour, has to be spun not reeled off. Before this is done the cocoons are softened by boiling them in water and a solution of alkali. Empty cocoons yield about three quarters of their weight in thread.

The *Eri* worm is regarded as impure by the higher castes and its cultivation is restricted to Lalungs, Kacharis, Nadiyals, Haris, Namasudras or Charals, and other low caste people. The places in which the thread is produced in the largest quantities are the Baropujia, Mikirbheta, Dhing, Kandali, and Kathiatali mauzas; the best markets for *eri* cloth are the ones at Jaluguti, Phulaguri, Gobha, and Barpani.

Cost of silk cloths. The most useful garment made of *eri* silk is the *bar kapor*, a large sheet sometimes as much as 20 feet in length by 5 feet wide, which is folded and used as a wrap in the cold weather. It costs from Rs. 10 to

Rs. 16. *Eri* cloth is also made into coats and petticoats. Women's clothes, both petticoats and the shawls worn over the bust, are, however, usually made of *muga* silk, the thread required for a complete dress costing from Rs. 5 to Rs. 7. The instruments used for twisting and weaving silk are the same as those employed for cotton, but for *eri* thread a stronger reed is employed.

The weaving of cotton cloths is carried on by rich Weaving. and poor alike, and one or more looms are to be seen in the courtyard of almost every house. Though cotton is grown in the hills, and though many different dyes are to be found growing in the forests, imported yarn, which is supplied in the requisite shades by the village shop-keeper, is usually employed. The loom consists of four stout posts which are driven into the ground so as to make a rectangle about 5' 10" × 2' 6", and are joined together at the top by cross beams. The implements required for the conversion of raw cotton into cloth, and the system of manufacture followed are described in the minutest detail in a "Monograph on the Cotton Fabrics of Assam," published by the Superintendent of Government Printing at Calcutta in 1897. Descriptions of mechanical processes of this nature are, however, at their best unsatisfactory, and are hardly intelligible without a series of diagrams. The total cost of the whole apparatus is from ten to fifteen rupees, and as weaving only occupies the leisure moments of the women, the use of home-made clothing helps to save the pocket of the villager. Very little cotton cloth is prepared for sale, and there can be little doubt that,

weaving as an industry is commercially a failure, the price obtained for the finished article being out of all proportion to the time expended on its production. The principal articles made are *gamchas* or napkins, often worn on the head, large sheets or shawls worn as wraps, called *chadar khandia* or *bar kapor*, and smaller shawls called *chelengs*. A kind of shawl called *paridia kapor* is very finely made and is enriched with a beautifully embroidered border. It costs sometimes as much as Rs. 200.

Pottery.

The pottery produced is of a very rough and simple character, and most of the potters combine this occupation with agriculture. The earth used is generally a glutinous clay, which is well moistened with water and freed from all extraneous substances. If it is too stiff, some clean coarse sand is worked up with it. A well kneaded lump of clay is then placed on the wheel, which is fixed horizontally and made to rotate rapidly. As the wheel revolves, the potter works the clay with his fingers and gives it the desired shape. The vessel is then sun dried, placed in a mould, and beaten into final shape with a mallet, a smooth stone being held the while against the inner surface. It is then again sun dried, the surface is polished, and it is ready for the kiln. The collection of the clay and firewood, the shaping of the utensils on the wheel, and the stacking of them in the kiln, form the men's portion of the work. The women do the polishing and the final shaping. The Hiras, however, do not use the wheel, but mould the vessel on a board, laying on the clay in strips, and the whole of this work is entrusted to the women.

The instruments employed are—the wheel (*chak*) which is about three feet in diameter and rotates on a piece of hard pointed wood fixed firmly in the ground, the mould (*athali*), a hollow basin about 16 inches long by 3½ inches deep, the mallet (*baliya piteni*), and the polisher (*chaki*).

The principal articles manufactured are cooking pots, water jars, vessels in which rice is boiled (*thali*), and larger vessels (*hari* and *jaka*) with lamps, pipes, and drums. The profits of the business are said to be small, and the local pottery is being gradually ousted by a superior quality of goods imported from Bengal, and by metal utensils which are coming extensively into use. The principal centres of the industry are at the following villages :—Charalgao and Kumargao in Khatoalgao mauza, Kumargao in Kachamari mauza, Potani, Dharamtul, and Nanai Kumar.

The brass and metal industry is not of much importance. Bell-metal utensils are cast in moulds, but brass vessels are made out of thin sheets of that metal which are beaten out and pieced together. The implements of the trade consist of anvils of different sizes (*belmuri chatuli*), hammers, pincers, and chisels. The furnace is simply a hollow in the floor of the hut, and the bellows are made of goat's skin. When it is desired to join two sheets of brass together, nicks are cut in one edge, into which the other edge is fitted, and the two are then beaten flat. A rough paste made of borax and *pan*, a substance which consists of three parts of sheet brass with one part of solder, is then smeared over

Brass and
bell-metal.

the join. The metal is heated, the *pan* melts, and the union is complete. The principal articles manufactured are small flattish bowls, often used as drinking cups (*lota, bati*), jars for holding water (*kalsi, gagari*), trays (*sarai*), boxes to carry betel-nut and lime (*tema, temi*), and large vessels used for boiling rice (*thali*). The chief centres of the industry are at Kuwarital, Raha, Jagial, Samaguri, Moriagao in Barbhagia mauza, Sutar-gao in Khatoalgao mauza, and at Kahargao in the Raha tahsil, but the number of these artizans is very small.

Lac.

The lac industry is almost entirely in the hands of the Hill Mikirs and Hill Lalungs, and most of the stick lac produced comes from mauza Rangkhong, and to a certain extent, from Duar Amla. The insect is reared on various members of the ficus family, and on arhar (*cajanus indicus*), but as far as is known, the quality of the product is not affected by the tree on which it has been fed. The method of propagation is as follows. Pieces of stick lac containing living insects are placed in baskets and tied on to the twigs of the tree on which the next crop is to be grown. After a few days, the insects crawl on to the young branches and begin to feed and secrete the resin. They are left undisturbed for about six months, and the twigs encrusted with the secretion are then picked off. A good sized tree yields from 30 seers to 2 maunds of stick lac, the best results being obtained from trees of moderate growth, which do not contain too rich a supply of sap. Two crops are generally obtained in the year, the first being collected in

May and June, the second in October and November. The first crop is largely used for seed, and it is the second which supplies the bulk of the exported lac. Ants and the caterpillars of a small moth sometimes do much damage to the insect, and a heavy storm at the time when they are spreading over the tree will destroy them altogether. Almost all the lac produced is exported in the crude form of stick lac, but the hill tribes occasionally extract the dye which they require for their own use, by placing the lac in a wooden mortar, pouring boiling water over it, and pressing it with a pestle.

The Nowgong mats are of three kinds *kath*, *dhari*, Mat-making and *pati*. The *kath* mats are woven in a wooden frame and the industry is not confined to any special caste. The better kinds, which are made from the *kuhila* plant (*aeschynomene aspera*) fetch from four annas to ten rupees according to size. A cheaper variety made from *murtha* (*marantha dichotoma*), and *hogal*, (*typha angustifolia*) only cost from two annas to a rupee. The following villages are noted for the manufacture of these mats, Bardoa, Baropujia, Dighaldari, Kaliabar, Kathiatali, and Morakalang. The *dhari* mats are made from strips of bamboo by Mikirs, Lalungs, and Kacharis in the hill mauzas. The price varies from two annas to two rupees according to size. The manufacture of *pati* mats is almost entirely restricted to the Patias, a section of the Kewat caste. They are made from *patidoi* (*clinogyne dichotoma*) but are not so neatly finished off as the *sitalpati* mats of Sylhet

and Bengal, and cost from four annas to five rupees. The principle centres of the industry are Nowgong, Baropujia, Raha, and Kathiatali.

Jhapi.

The *jhapi* is the national hat of the Assamese and is made in every district of the valley, but the hats of Nowgong are noted for the elaborate character of the decoration and the excellence of the finish. The *jhapi* is made of bamboo and the leaves of the *takau* palm (*livistonia jenkinsiana*). The general principle is invariably the same. The head is inserted into a circular and conical erection about five inches high, which rises from a broad flat brim, but with regard to the breadth of this brim considerable latitude is allowed. The largest varieties of *jhapi* are about four feet in diameter, and are generally held over a lady or a priest to protect them from the sun. The hats that are actually worn, are usually about two feet in diameter. The foundation consists of strips of bamboo arranged horizontally and vertically at intervals of about two inches. On this is laid a small neat mesh-work of tiny bamboo slips, which supports the *takau* leaves which form the actual protection against sun and rain. Similar mesh-work on the top keeps the leaves in position, and the whole is decorated with strips of red and blue cloth, silver braid, and little balls of thread. These ornamental hats are known as *sorudoia jhapis*, and are generally worn by women, and more especially by Muhammadans and by members of the lower Hindu castes such as the Nadiyals and Brittial Baniyas. The ordinary *jhapi* for common use is known

as *dhoriah*, and the cheapest form of hat, worn by ploughmen to protect them from the sun and rain, as *halwah*. The best *jhapis* are made at Kandali, Uriagaon, Jagi, and Kathiatali, the price ranging from four annas for the cheapest and commonest variety to five rupees for the better kinds. Sieves and baskets are made in every part of the district out of split bamboo. Each villager generally makes enough to satisfy his own requirements, and they are not usually bought or sold.

Fish is caught for home consumption by every section Fishing. of the community, but Doms or Nadiyals and the Charals or Namasudras are the only Hindu castes who will catch it for sale. The result of their labours is generally disposed of locally, and curing is only undertaken by Kacharis, Lalungs, and Mikirs who sell a little dried fish at the Jiajuri, Tapatjuri, Rangalu, Neli, Khola, and Amchoi *hats*. The varieties which are most esteemed for the table are:—the roe (*labeo rohita*), the chital (*notopterous chitala*), the ari (*arius*), the magur (*clarias magur*), the pufta (*callichrous bimaculatus*) and the hilsa (*clupea ilisha*). The nets most commonly in use are (1) the *Ghakata* a net in the shape of a shovel which is pushed through the water. (2) the *Khewali* a piece of netting to the centre of which a rope is attached while all round the edges there are weights. The net is thrown flat on to the surface of the water, when the weights sink and drag the sides together. It is then drawn by the rope to a boat or bank, and any fish that may have been swimming

in the water over which it has been cast are entangled in the pockets round the edge. The following names are applied to this net as the mesh decreases in size, *regh*, *afalia*, *duangulia*, *angatha*, and *ghan khewali*. (3) The *langi*, a large net which is stretched right across a river, the bottom being weighted and the top buoyed. The fish are then driven towards the net and become entangled in its meshes. The *tana langi* is a smaller variety the two ends of which are brought round to form a circle as the net is not long enough to reach across the river. (4) The *parangi*, a square net the opposite corners of which are fastened to flexible bamboos. The net thus hangs like a sack from a stout post to which the bamboos are attached, and is lowered into the water and raised at intervals. (5) An *uthar* is a large *khewali* which is worked on the same principle, but as it is too heavy to be thrown by hand, it is spread on the surface of the water from a boat. A variety of this net with especially large meshes is called a *batihal*. (6) A *ghat-jal* is fastened to a bamboo staging above the water, and is raised and lowered on the lever principle. There are various kinds of wicker traps in use. The one most commonly employed is called a *polo* and resembles a gigantic wine glass with a short stem, and is used by a fisherman who walks through shallow water and keeps pressing the rim on the mud at the bottom. Any fish that are caught are removed through an opening at the top. The *juluki* is a smaller kind of *polo*. The *jakai* is a species of wicker work shovel, which is either dragged along the bottom or placed on the ground to

catch the small fry who take refuge in it when the mud is trampled up. Conical bamboo traps which are called *dingaru*, *thupa*, *sepa*, and *gui* and are worked on the principle of the lobster pot, are placed in small streams or running water near the rice fields.

The Government fisheries are put up to auction; the most important being:—(1) The Kalang, (2) the Pota Kalang *bil*, (3) the Mora Kalang *bil*, (4) the Samaguri *bil*, (5) the Rupahi, (6) the Mecha *bil*, (7) the Kuji *bil*, (8) the Udori *bil*, (9) the Khonaghoria *bil*, (10) the Sondora *bil*, (11) the Kapili, (12) the Sonai, (13) the Tetelisara, (14) the Barpeta *bil*, (15) the Bor Ran-mari *bil*, and (16) the Kola Duar *bil*.

Altogether they realized upwards of Rs. 11,000 in 1903, the lessees recouping themselves by charging the professional fisherman who have recourse to their *mahal* rates, varying from one to twenty rupees per net. Villagers who only catch fish for their own consumption are treated very liberally and only pay a fee of four annas per annum. Figures for subsequent years will be found in Table XII.

CHAPTER VI.

ECONOMIC CONDITION OF THE PEOPLE,
COMMUNICATIONS, TRADE, TOWN,
AND LOCAL BOARD.

Rent—Wages—Prices—Food and dress—Dwellings—Economic condition of people—Indebtedness—Sources from which villagers obtain cash—Social restrictions—Communications—Development of steam navigation—Railway—Roads—Waterways—Post and Telegraph—Commerce and trade—Municipality—Local Board.

Rent. When land is sublet the rent is paid either in cash or in kind, the former system is known as *sukani* or *khandua*, the latter as *adhi*. Under the *chukti adhi* system the tenant contracts to deliver a fixed quantity of grain irrespective of the character of the harvest, but the more usual procedure is for the tenant and the landlord to divide the crop. The following description of the different forms of *adhi* tenure is taken from a note by Mr. Basu, Assistant to the Director of Land Records and Agriculture:—

“The commonest form is *adhi* proper, in which the crop is divided equally between the landlord and the tenant. The produce may be divided either before reaping (*gach-adhi*), in which case the standing crop is divided in the field, each party reaping his own share; or after the tenant has cut the crop (*dal-adhi*) when the bundles (*danguris*) are equally divided; or after the tenant has cut and threshed the crop (*guri-adhi*) when the grain is divided. All work prior to the act of division and expenses

incidental thereto are borne by the tenant. The seed grain alone is, as a rule, found by both parties in equal shares, and if one party has advanced it in the beginning, one bundle of paddy per *bigha* is deducted from the whole in payment of the advance, and the remainder is then divided equally between the landlord and the tenant. There is still another kind of division in which the tenant undertakes to cultivate the land up to the stage of the puddle (*boka-adhi*), when the land is divided in equal parts, each party transplanting his share with the own seedlings and at his own cost.

In every form of *adhi*, the Government dues are paid by the landlord. As a rule, it is only good productive lands which can be let on *adhi* tenure, particularly on the *chukti* and *guri* forms of the tenure. In *adhi* tenure, no extra payments are called for. Cash paying tenants, however, are often called upon to pay various perquisites which go to swell the nominal rent due. The most common is gratuitous labour for a certain number of days in the year. This is ordinarily the case with all tenants holding temple lands. Not unoften the rent is partly, and in some cases, wholly remitted in consideration of labour to hereditary tenants who are descendants of former *paiks* attached to the temple."

Statistics of subtenancy were compiled in 1899-1900 and are summarised in the following abstract :—

Total settled area for which returns compiled. Acres.	Total area sublet. Acres.	Area paying produce rents. Acres.	Area paying cash rents. Acres.
181,900	9,597	1,009	8,588

It will be seen that only 5 per cent. of the settled area for which statistics were collected was sublet, and that a little less than a ninth of the area sublet was held on *adhi* terms. In the great majority of cases the cash rent paid did not exceed the Government revenue demand upon the land. This is only natural as it is obvious that land cannot have a high subletting

value in a district like Nowgong, where there are great expanses of Government waste, and considerable areas which have actually been brought under the plough, but have been abandoned owing to the ravages of *kala-azar*. According to the census the number of tenants in Nowgong, both workers and dependants was 3,322 in 1891 and 5,600 ten years later.

Wages.

There is really no such thing as a labouring class in Nowgong, and in 1891, when no railway work was going on, only 1,049 persons described themselves as being supported by earthwork or general labour. Members of the lower Hindu castes and of the aboriginal tribes will occasionally work for hire, but all the local revenue officers report that year by year the difficulty of obtaining servants or labourers, which was at all times great, is steadily increasing. The daily wage in the more densely populated portion of the district, *i.e.*, along the banks of the Kalang from Silghat to Raha, varies from five to six annas, but elsewhere it is generally about one anna lower. Harvest work is paid for at lower rates, while work on the railway commands a wage of at least eight annas a day. This curious difference is probably due to the imperative necessity of getting in the harvest, while railway work is optional, and, as it is done for foreigners, is probably regarded as involving a certain loss of social status. In the Garubat mauza, a ploughman who brings his own plough and buffalo gets ten annas, or, if he only uses bullocks, six annas a day, a rate considerably higher than that reported from the

neighbouring mauza of Kampur. Carpenters and masons are said to get one rupee, and blacksmiths thirteen annas a day. The number of these artizans is, however, quite insignificant, and in quoting a rate of wages for the district it must always be borne in mind that labourers cannot as a rule be obtained at all except through the intervention of some individual possessed of local influence.

The price of rice, the staple food grain, is subject to marked fluctuations, and the total volume of business done in Nowgong town, the place where returns are recorded, is so small that they do not afford a very reliable indication of the real condition of the market. Prices.

The statement in the margin shows that there has been a general rise in price, which has, however, been subject to marked variations, as rice, for instance, was very much cheaper in 1900 than it was either in 1879 or even so long ago as 1865.

	Seers purchaseable for a rupee.
1862	.. 20
1865	... 12
1867	... 20
1879	... 9
1889	... 16
1897	... 7
1900	... 15

The average price in each of the four decades ending with 1872, 1882, 1892, and 1902, was seventeen, fourteen, fourteen, and eleven seers. During the last decade the district has been passing through a period of extreme depression. *Kala-azar* was raging, the people died like sheep, and the survivors could hardly be expected to grow more grain than was absolutely necessary. Apart from this the seasons were unfavourable and the actual harvests were unusually poor. A gradual rise of prices has no

doubt been going on, but it is not so pronounced as the averages recorded would at first suggest. The price of pulse has also been rising since 1880, but there has been a considerable decrease in the price of salt. Now-gong like the rest of Assam has never suffered from famine since the days of British rule. Further details with regard to prices will be found in Table IX.

**Food and
dress.**

The staple food of the people is boiled rice, eaten with pulse, spices, and fish or vegetable curry. Amongst the well-to-do, pigeon or duck occasionally take the place of fish, but fish is a very common article of diet, and is said to be a substitute for *ghi*, which is not very largely used. Goat's flesh is eaten by Muhammadans and members of the Saktist sect, and venison is always acceptable, and is frequently procurable, especially in times of flood, when the deer are driven on to the higher ground and are ruthlessly slaughtered from boats. Tea drinking is very common, especially in the early morning. Sweetmeats usually consist of powdered grain mixed with milk, sugar, and *ghi*. The ordinary form of dress for a villager is a cotton *dhuti* or waistcloth, with a big shawl or wrapper, and sometimes a cotton coat or waistcoat. Women wear a petticoat, a scarf tied round the bust, and a shawl. Amongst the Assamese these cloths are generally home-made, and in the case of the women and of the large wraps used in the cold weather by men are frequently of silk. Men and women alike generally go bare headed, but the former sometimes twist a handkerchief round their heads, and on sunny or rainy days both sexes have recourse to the broad brimmed *jhapi*.

Boots and shoes are the exception, and in their own homes even well-to-do people wear wooden clogs. Wooden sandals are also used by villagers when travelling or working in jungle ground, where there are tufts of sharp-pointed grass.

The homestead of the ordinary peasant is generally separated from the village path by a ditch or bank, on which there is often a fence of split bamboo. Inside there is a patch of beaten earth which is always kept well swept and clean. Round this tiny courtyard stand two or three small houses, almost huts, and in a corner there are generally two open sheds, one of which contains a loom, while the other serves the purpose of a cow-house. The whole premises are surrounded by a dense grove of bamboos, plantains, and areca nut trees, and there are often numerous specimens of the arum family covering the ground. The general effect is extremely picturesque, but the presence of all these plants and trees makes the homestead very damp and excludes all sun and air. At the back there is usually a garden in which vegetables, tobacco, and other plants are grown. The houses are small, dark, and ill-ventilated, and must be very hot in summer, and as they are built on low mud plinths, must be extremely damp. The walls are made of reeds plastered with mud, or of split bamboo, the roof of thatch, the rafters and posts of bamboo. All of these materials can as a rule be obtained free of charge, and a house costs the owner nothing but the trouble of erecting it, but in spite of this they are small and badly built. The houses of the middle class are built on practically Dwellings.

the same plan, but they are larger, and wooden posts and beams are often used in place of bamboo. The furniture of the ordinary cultivator is very simple and consists of a few boxes, wickerwork stools and baskets, brass and bell-metal utensils, and bottles and earthen pots and pans. His bedding is a quilt made out of old cloths, and he either sleeps on a mat on the damp floor or on a small bamboo *machan* or platform. The well-to-do have beds, tables, and chairs in their houses, but these articles of luxury are seldom found outside the town. This style of house is common to all the Assamese, but in the flooded tracts there are none of the graceful areca palms, as the tree cannot thrive if the roots remain long under water. These orchards and gardens are a considerable source of wealth to the cultivator, and a house standing on a bare patch of ground, has always a somewhat poverty stricken appearance to eyes accustomed to the luxuriant vegetation in which the typical Assamese cottage is embedded. The aboriginal tribes nearly always build on platforms or *machans*, and as they keep pigs and fowls they seldom have good gardens round their houses.

Economic
condition of
people.

There are no rich men amongst the Assamese in Now-gong, and very few who are even moderately well-to-do, but the explanation of this fact is not far to seek. The Assamese is a cultivator and nothing more, and with wholesale trade, crafts, and industries, he has little or no concern. Practically the whole of the profits of the external trade of the district pass into the hands of the Marwari merchants, and, though large sums of money

were expended by the Assam Bengal Railway Company in Nowgong, coolies and contractors alike were foreigners, and the profits of capital and the wages of labour passed into foreign hands. Farming on a large scale is impossible owing to want of capital and the absence of a labouring class, and the immense mass of the peasant proprietors are petty cultivators, who drive the plough themselves and carry home the rice that has been cut by their wives and daughters. Such a community can never become rich, but it is well removed above the line of poverty, and it is seldom that any villager in Nowgong goes hungry to his bed. Along the banks of the Kalang, the people have as a rule good gardens, which are a considerable source of wealth. Their rice fields are above flood level and are not liable to be destroyed by sudden inundations, but on the other hand, there is a certain amount of pressure on the soil. On the *chapari* there is an abundance of waste land, but the floods of the Brahmaputra render the crop precarious, and prevent the growth of betel nut and other fruit trees.

The principal charges upon the indigenous inhabitants of Nowgong are, land revenue, local rates, and opium. In 1902-03, these three items amounted to Rs. 7,57,000, rather more than one-third of which had to be debited to the head of opium. The mustard crop in that year must have been worth to the villagers at least Rs. 7,76,000, so that from this crop alone they could meet all the demands made on

them by the state.* The people in the hills obtain money by the sale of lac and cotton, and the garden coolies put a considerable amount of cash in circulation. On June 30th, 1903, there were some 12,000 adult coolies in the district, who probably spent on the average about Rs. 2-8 per mensem on poultry, vegetables, and rice sold to them by the villagers, or about Rs. 3,00,000 in the year. There is a growing taste for the use of imported articles of food and dress, and the demands made upon the raiyats' purse are heavier than they were half a century ago, when the absence of any means of communication except country boats rendered it far from easy, either to buy or sell. The price of wives and the cost of the wedding ceremony is said to be increasing, a fact which points to an increase in the amount of cash in circulation, as the Indian vendor is very prone to adapt his price to what he considers to be the capacities of the purchaser. The increasing difficulty in obtaining labour also suggests a general advance in the position of the people.

**Indebted-
ness**

At the same time the various revenue officers report that more than half the village population are in debt. Indebtedness is said to be quite the exception in Kam-pur. In Gobha and Churaibahi only about one-fourth of the population are involved, and in the Raha and Samaguri tahsils one-third, but elsewhere the proportion ranges from one-half to three-fourths. But generalizations of this kind must, obviously, be received with

* The normal yield has been ascertained to be about 550 lbs. per acre, and it has been assumed that the mustard is sold for Rs. 2-8-0 per maund, an estimate, which, if any thing is unduly low. Against this must be set the fact that no deduction has been made for seed or for mustard consumed locally.

caution. The raiyats are very ready to descant on their poverty to all who turn an attentive ear, and it is doubtful whether they are as much in debt as they would fain appear. The system of taking advances on the crop, especially on the mustard crop, seems to be very common, but in many cases, no doubt, the necessity for taking these advances might be avoided by the exercise of a little thrift, industry, and foresight. It is difficult to believe that the indebtedness of the villagers can be very serious, as, apart from the standing crop, they have but little security to offer. The rate of interest charged is said to vary from $37\frac{1}{2}$ to 75 per cent., the lenders being usually kaiyas or foreign traders.

The villagers obtain the cash required for the payment of land revenue from the sale of paddy, mustard, pulse, vegetables, and poultry. In the Langpher mauza they take work on the railway or hollow out canoes, and here and there raiyats are to be found who actually consent to work upon the roads, but the number of such persons is extremely small. The standard of comfort is distinctly low, but this seems to be chiefly due to the apathy and indolence of the people. Their houses cost them nothing but the trouble of erecting them, but they are dark, squalid, and ill-ventilated, and a strong disinclination to incur any unnecessary trouble is a marked characteristic of the Assamese. Mr. Melitus, the Commissioner of the Valley, reports that the average villager will ordinarily only cultivate as much land as is absolutely necessary and no more, and that this is not merely his personal opinion, but one that is shared by the local re-

Sources
from which
villagers
obtain cash.

venue officials, and by almost all officers with Assam experience from the time of General Jenkins and General Hopkinson to the present day. Under these circumstances it is not to be expected that there will be much of comfort or luxury amongst the Assamese or any considerable accumulations of capital.

**Social
restrictions.**

The following are some of the restrictions imposed by custom on the daily life of the people. Villagers will not plough on the day of the new moon or full moon, or the eleventh day after either of these dates. In places they decline to pay revenue on Saturdays, Mondays, Wednesdays, or Fridays, or to give loans of money or paddy on those days. There is a curious local diversity in this particular, as though Saturday, Monday, and Wednesday seem to be inauspicious days for any kind of business in almost every part of the district, in Kam-pur, Saturday, Tuesday, and Thursday are days on which no man pays his revenue; and in Kachamari, Sunday too is barred. There is thus not a single day in the week which is considered auspicious for the payment of revenue in every part of the district. In Pubtharia, it is said that the people will not build their houses, catch fish, or sow mustard on Mondays and Wednesdays, and in Juria, Dandua, and Tetelia, Saturdays and Tuesdays are considered to be inauspicious days on which to sow. In Gerua fencing must not be erected on Mondays, floors prepared on Tuesdays, or straw cut on Saturdays. All castes catch fish, but only Jaliya Kai-barttas, Nadiyals, Namasudras or Charals, and the aboriginal tribes will sell it, and the preparation and sale of

dried fish is eschewed even by the Hindu fishing castes. The *pat* worm is only reared by the Katani subdivision of the Jugi caste, and all the Assamese have a strong prejudice against hiring themselves out as labourers, especially if they are to be employed by Government. They are very scrupulous in many ways, object to the use of well-water, and the fear that his cart might be hired by a European and have a piece of beef or a fowl or two put in it, has been put forward by a villager before now, as a sufficient reason for not embarking in the carting business.

The communications between Nowgong and the outside world have passed through five distinct stages of development:—the country boat, the Government steamer, the private cargo steamer, the daily steamer service, and the railway. The country boat was the legacy we received from the days of native rule. It had served the Ahom princes well enough, they possessed a numerous and well appointed fleet, and as they had no wish to see foreigners in the valley of the Brahmaputra, and little desire to travel out of it themselves, it was nothing to them that Nowgong was many weeks journey from the sea.

But when the British came into possession of Assam, the difficulty of communications proved at first to be a most serious obstacle to the development of the Province. The Brahmaputra was the great highway which connected this portion of the Company's dominions with Bengal, but the journey up the river for any boat of ordinary size was a very lengthy business.

Communica-
tions.
Remoteness
of Nowgong.

Early
difficulties.

McCosh, writing in 1837,* stated that a large boat took from six to seven weeks to come from Calcutta to Gauhati, though the post, which was conveyed in small canoes rowed by two men, who were relieved every fifteen or twenty miles, reached Gauhati in ten days and Bishnath in three days more.

Few people, presumably, had sufficient time or patience to undertake the voyage at the rainy season of the year. Week after week the weary traveller must have pursued his tedious way, his view bounded as a rule by high banks of treacherous sand, which then as now were continually being undermined by the current and falling with a crash into the water. It was only occasionally that he could relieve the monotony of the voyage by a stroll on shore, as through the greater part of its course down the valley, the banks of the river are covered with high reeds and grass, which are quite impenetrable to a man on foot, and the tedium of this dreary voyage must have been immense. Canoes, of course, could travel faster against the current, but a canoe is not a vessel in which the ordinary man can journey for many days in comfort.

Beginning
of steam
navigation.

This was the state of things for twenty-two years after our annexation of the Valley, but in 1848, the Government steamers were deputed to ply between Calcutta and Gauhati. Three years later, the Commissioner, Major Jenkins, made the not unreasonable proposal that, three or four times a year they should be allowed to proceed right up the Valley to Dibru-

* Topography of Assam, pages 9 and 82.

garh. His suggestions were negatived by the Marine Department, on the ground that the voyages would be financially a failure, but his views were strongly urged on Government by Mr. Mills when he visited the Province in 1853. The proposal met with the approval of the Lieutenant-Governor, instructions were issued for the despatch of a steamer in that year, and several voyages were made with results that were not unsatisfactory even from the financial point of view. The journey from Gauhati to Dibrugarh and back occupied no more than fifteen days, an extraordinary contrast to the interminable delay of the same voyage in a country boat, and the facilities afforded were fully appreciated by the commercial community in Assam. The cargo tendered soon exceeded the carrying capacity of the steamers, and in 1855, Lieutenant-Colonel Jenkins complained, that the vessels reached Gauhati fully laden with goods shipped in Upper Assam, so that Gauhati and the ports below derived practically no advantage from the downward service of the steamers.

As was only to be expected, the rates at first charged were fairly high, and a ticket from Calcutta to Gauhati cost no less than Rs. 150. On the other hand, the accommodation was designed on an extremely liberal scale. The regulations issued in 1851 expressly authorized passengers to carry pianos in their cabins free of freight, provided that, they were required for use during the voyage and were not in packing cases, a proviso which suggests a very deliberate

voyage as compared with the speedier travelling of the twentieth century. Freight on ordinary stores seems to have been charged at the rate of one rupee per cubic foot between Calcutta and Gauhati, but for some time longer a great part of the trade of the Province continued to go by country boat. The planters could never count on being able to despatch their tea by steamer, and were thus compelled to keep up an establishment of country boats, and having got the boats, to use them, and the same objection held good in the case of native merchants.* The cost of working the line was heavy, but in spite of this, it showed a fair profit, and it was evident, that there would be a great development of the traffic if only facilities were provided for it.

Private
steamers put
on the river.

In 1860, the India General Steam Navigation Company entered into a contract to run a pair of vessels every six weeks, provided that the Government boats were taken from the line, and, since that date, the steam navigation of the Assam Valley has been in the hands of this Company, and the River Steam Navigation Company, with whom they are associated. But, in spite of the existence of a regular service, and the quickening effects of private enterprise, travelling still continued to be very slow. The steamers did not profess to run to scheduled time, the delay at the larger ports for the loading and unloading of cargo was considerable, and the passenger no doubt often required

* Memorandum by the Director of Public Instruction, Bengal, dated the 7th February 1857.

his piano to beguile the tedium of the way. In 1861, the Commissioner, Colonel Hopkinson, was disposed to take a gloomy view of the condition of affairs, and, in a letter to Government, openly gave expression to the opinion that, it would be better to compensate the planters for any loss they might sustain, and abandon the Province, unless Government were prepared to enter upon a course of vigorous material improvement. In the same letter, he drew the following dreary pic-

ture of the isolation of Assam:—"With the furious current of the Brahmaputra, still unconquered by steam, opposing a barrier to all access from without, and not a single road fit for wheeled carriage, or even passable at all for a great portion of the year, there is such an absence of the full tide of life running through Assam, such a want of intercourse between man and man, as does and must result in apathy, stagnation, and torpidity, and a terrible sense of isolation, by which enterprise is chilled, and capital and adventurers scared away. The profits of tea cultivation should attract hundreds where tens now come, but the capitalist is not always to be found who will venture his money in a country to which access is so difficult as it is to Assam, through which his correspondence travels at the rate of a mile and a half an hour, and in which it may take a month to accomplish a journey of two or three hundred miles; nor, on the other hand, is it every spirit, however bold, that cares to encounter so dreary a banishment, and to be so entirely cut off from his fellows in a place from which exit is only possible at rare intervals, and must be so literally a prison or tomb to him."

Matters, however, gradually improved, and in 1884, ^{The daily mail service.} a daily service of mail steamers was started between

Dibrugarh and Dhubri, connecting with a steamer which plied between the latter place and Jatrapur. Here the traveller who was pressed for time could take the train to Calcutta, though the line was not of the most comfortable, as more than one river had to be crossed in boats before the capital of Bengal was reached.

The introduction of a daily steamer service represented an enormous advance in the facilities for communication between Assam and the outer world. The large steamers were not uncomfortable, but progress was slow, and not only the hour but the date on which they left any given port was far from certain. The would-be traveller could not choose his own time for starting on his journey, but had to select a date on which a steamer was expected at the nearest ghat, and even then he not unfrequently had to endure a weary period of waiting by the river bank. The daily service changed all that, and combined the advantages of regularity with a speed, which, in comparison with that attained by the large cargo boats, was most commendable. During the rains Dibrugarh was reached on the fifth day after leaving Dhubri, while the downward journey was performed in three days. The navigation of the river is not entirely free from difficulty, the companies were not incited to further efforts by competition, and some years elapsed before any attempt was made to reduce the duration of the voyage. On the completion of the Assam-Bengal Railway, the companies realized that it was necessary to accelerate their

timing if they were to retain their traffic, and steamers now reach Dibrugarh on the fourth day from Dhubri, while the voyage from Dibrugarh to Goalundo only occupies three days. This, however, is the rains timing and in the cold weather it is a voyage of five days from Dhubri to Dibrugarh and four days from Dibrugarh to Goalundo.

Prior to the construction of the Assam Bengal Railway, the daily passenger steamers and the large cargo boats were practically the only means of communication between Nowgong and the outside world. Silghat which is 32 miles by road from Nowgong is the port of call and in the rains the passenger steamers are timed to reach Dibrugarh about 34 hours, and Dhubri, which is 19 hours by rail from Calcutta, about 26 hours after leaving Silghat.

The south of Nowgong is, however, now served by The railway. rail. The Gauhati branch of the Assam Bengal Railway enters the district a little to the west of Nakhola, and passes through the Gobha mauza and the Raha tahsil. At Chaparmukh it turns to the south-east and runs up the valley of the Kapili, and finally leaves the district $3\frac{1}{2}$ miles west of Dimapur. The stations going from west to east are Jagi Road, Dharamtul, Chaparmukh, Kampur, Jamunamukh, Lanka, Lumding and Diphlu. At Lumding the Gauhati branch joins the main line which makes its way through the North Cachar Hills and down the Surma Valley to the sea at Chittagong, while eastward it connects with the Dibru-Sadiya Railway at Tinsukia.

In the Gobha mauza the line runs most of the way through land which lies too low for cultivation, and though in the Raha tahsil rice fields and villages once more appear, the Kapili valley is a great savannah which is very sparsely peopled. East of Jamunamukh there are hardly any signs of the handiwork of man, and a little to the west of Lumding the railway enters the huge forest which covers the valley between the Naga and the Mikir Hills and stretches far beyond the boundaries of Nowgong into Sibsagar.

Cultivation is, however, beginning to extend near Lumding, and to a less extent near Kampur, Jamunamukh, and Lanka, and with the facilities for communication now afforded, it is to be hoped that population will increase in the neighbourhood of the line. At Chaparmukh the railway taps the trade that has come down the Kapili from the hills, and tea is booked from Jagi Road, Dharamtul and Kampur, but as long as so much of the land through which it runs remains untilled and uninhabited, neither goods nor passenger traffic can be expected to be large. Kampur is the nearest station to Nowgong and is 67 miles from Guahati, 282 miles from Dibrugarh, and 412 miles from Chittagong.

**Roads: the
Trunk Road.**

The principal road in the district is the trunk road which runs along the whole of the south bank of the Brahmaputra from a point opposite Dhubri to Saikhoa near the eastern frontier of Lakhimpur. It enters Nowgong a little to the west of Nakhola where there is an inspection bungalow, and skirting the hills crosses the

Umiam or Kiling by a ferry at Amalighat. The first halting place after Nakhola is Dharamtul $14\frac{1}{2}$ miles away, where the Kapili is crossed by a ferry; from there, there is a march of $12\frac{1}{2}$ miles to the Raha inspection bungalow, but before reaching that place the Kalang must be crossed by a ferry in the rains or by a temporary bamboo bridge in the dry season. From Raha to Nowgong it is 14 miles, but before entering the station the Kalang has to be recrossed, either by a bridge or ferry. Beyond Nowgong there are inspection bungalows at Puranigudam on the 8th, Rangagora on the 16th, and Kuwarital on the 28th mile. Here the trunk road turns sharply to the east, but there is a branch road to Silghat, $4\frac{1}{2}$ miles distant, which crosses the Kalang by a ferry when that river ceases to be fordable. The road now runs between the Mikir Hills on the south, and a swamp which separates it from the Brahmaputra. At Amguri, 10 miles from Kuwarital, there is a second class inspection bungalow; and there is another halting place at Bagari 15 miles further on, and three miles west of the boundary of Nowgong. The trunk road thus runs right through the district from the south-west corner to the north-east, a total distance of about 100 miles.

The Jagi road leaves the trunk road at Nakhola, crosses the Kapili by a ferry at Jagi, and after passing Aujhari and Baropujia, where there are inspection bungalows, ultimately reaches Nowgong. It is only 37 miles in length, or nearly four miles less than the trunk road between Nowgong and Nakhola, and there are only two ferries to be crossed in place of four. The Lao-

Other roads.

khoa road runs north from Nowgong to the Brahmaputra, a distance of 21 miles, and from there a ferry conveys the traveller to Tezpur which is situated on the opposite bank. There are inspection bungalows at Rupahi, and on the high bank of the Brahmaputra at Laokhoa, 17 miles from Nowgong. The only other roads through the *chapari mahals* are those from Nowgong to Dhing 17 miles, and Nowgong to Juria 6½ miles, at both of which places there are inspection bungalows. During the winter fair weather tracks are made over the plain to enable the raiyats to bring their mustard seed to market, but more roads are wanted in this portion of the district especially in the western mauzas. The country at the foot of the Mikir Hills in Duar Bamuni is served by the Amlaki-Kathiatali road, which runs parallel to the trunk road from Kampur to a point beyond Salana up the Diyu valley. There are inspection bungalows at Kampur, (19 miles), Kathiatali (12 miles), and Chapanalla (12 miles) from Nowgong; and there are several branch roads which connect this road with the trunk road between Nowgong and Kaliabar. A branch also runs to Dabaka on the Jamuna river, where there is an inspection bungalow. There are altogether 342 miles of road in the district or one linear mile for every eleven square miles of area. This proportion is certainly not high but it has already been explained that there are huge tracts in Nowgong which are very sparsely peopled, and it is doubtful whether more roads are required except in the north-west corner of the district. Judged

by the standard of population there is a mile of road for every 760 people, which cannot be considered an illiberal allowance. All of these roads are raised above flood level, but, as they are unmetalled, sections, like the road between Nowgong and Silghat, which carry heavy traffic, become exceedingly muddy after rain. The smaller rivers and streams are crossed by bridges, which are generally made of timber, but there are no less than 48 places where ferries are still employed. In the early days of our administration goods when carried by land were either sent on elephants or were carried on men's shoulders, but bullock or buffalo carts are now freely used and there were nearly 1,100 of such carts in the district in 1904.

The Brahmaputra is the great high-way for steamer Waterways traffic, but country boats do not generally go far above Gauhati. Reference has been already made to the extent to which the Kalang and Kapili are used for inland traffic. The following statement shows the other rivers in the district which are recognised trade routes, and the distance to which a boat of four tons burthen can proceed up them in the rains. The principal articles of commerce brought down these rivers are mustard, cotton, lac, and other forest produce.

Name of river.	Highest point to which a boat of 4 tons burthen can proceed in the rains.	Name of river.	Highest point to which a boat of 4 tons burthen can proceed in the rains.

**Post and
Telegraph.**

The following statement shows that, though there has been a comparatively small increase in the number of post offices since 1875, there has been an enormous development of postal business.

Number of Post Offices in		Number of letters and post cards omitting thousands delivered in			Number of Savings Bank accounts in		Balance at the credit of the depositor in	
1875-76	1903-04	1861-62	1870-71	1903-04	1872	1903-04	1872	1903-04
6	11	12	41	128	5	1,131	Rs. 97	Rs. 2,42,800

There were only 11 offices in 1904, as compared with 6 in 1875, but the number of letters and postcards delivered was nearly twelve times the number handled in 1861-62. The savings bank has also made most satisfactory progress, and considering the low rate of interest given, and the scarcity of capital in the district the volume of deposits is considerable. The figures given for 1872 were, however, returned after the bank had only been open for three months. A list of the post offices in the district will be found in the Appendix—Statement B.

**Commerce
and trade.**

It is hardly necessary to say that in a sparsely populated district like Nowgong, where there are no towns of any size, and, apart from tea, no industries worth mentioning, commerce and trade are not of great importance.

In addition to tea the principal exports are mustard seed, which is raised in considerable quantities on the *chapolis*, cotton, lac, cocoons, and chillies which come

down from the hills, bamboo mats, thatching grass, wax, and other forest produce. The principal trade routes are the Brahmaputra, the Kalang, and the various water courses in the *chapari*, down which the mustard is boated when the river rises. The Kapili affords an outlet to the trade of the North Cachar Hills which comes to Chaparmukh, and is either transferred to the railway there, or continues by boat *viâ* the Kalang to the Brahmaputra. The chief imports are pulse and other food grains, cotton thread and cloth, umbrellas, sugar, salt, opium, *ghi*, kerosine, and other oils, and hardware. Nearly all the export and import trade is in the hands of the Marwari merchants, locally known as Kaiyas, who are the great shop-keepers and money lenders of the Assam Valley. They purchase their surplus products from the raiyats, and supply them in return with cloth, thread, salt, oil, and, very often opium. There are altogether some 40 shops in Nowgong town and nearly 250 more scattered about the district. The importance of the hill trade is indicated by the fact that, no less than thirty-three of these depots are situated in the Rangkhong mauza. .

In addition to the Kaiya, there are a few Muhammadans from Bengal who have opened shops in Nowgong town where they sell furniture, hardware, and general haberdashery. Some of the smaller village shops are owned by Assamese, but the natives of the district have little or no commercial instinct or capacity, and allow almost the whole of the profits of their trade to be monopolised by foreigners.

In statement C in the Appendix will be found a list of the principal local centres of trade.

**Markets and
fairs.**

Retail trade is largely transacted at markets which are held at different villages on certain days in the week. The articles offered for sale include rice and other grain, fruit and country vegetables, poultry, earthenware and metal vessels, oil, molasses, tobacco, and cotton cloth. These markets are attended by all the people in the neighbourhood and there is a considerable amount of business done.

Statement D in the Appendix contains a list of all the villages in which markets are held. Regular fairs are also held at certain seasons of the year, but are not as a rule very numerous attended, in spite of the fact that they are usually associated with some religious festival. The places at which fairs are held are shewn in Statement E in the Appendix. These gatherings take place in April or May, except in the Raha tahsil where they are held in May or June.

Municipality.

Nowgong town was constituted a municipality under Act V, B. C. of 1876 in 1894, but it is little more than a large village, and the total population found within municipal limits in 1901 was only 4,430. Revenue is raised by a tax on persons amounting to $\frac{1}{8}$ per cent. of income, a tax on Government buildings, and a tax on animals and carts, but all these items taken together only brought in Rs. 2,400 in 1902-03. An annual grant from Government of Rs. 5,000, and realizations from pounds and

markets form more important sources of income. The incidence of taxation per head of population in 1902-03, excluding the amount realized from Government buildings, was only 4 annas 2 pie, which was less than that imposed in any other municipality or union in the Province. The affairs of the town are managed by eleven commissioners of whom nine are natives and seven non-officials. There are fourteen public wells, but rigid Hindus who have no private well, drink the water of the Kalang river, in spite of the fact that it is exposed to every form of pollution, as they object to using wells from which water has been drawn by a man of lower caste. Fortunately this prejudice is gradually dying out. The public buildings and the bungalows of the European residents stand on a fine maidan dotted over with really magnificent trees, and the general effect is rather that of a park than of a town. The roads are kept in good order and adequate arrangements are made for the drainage, conservancy, and lighting of the place. A statement of municipal receipts and expenditure will be found in Table XVII.

In the early days of British Administration there was little money available for public works of any kind, and what there was, was generally expended under the control of the Public Works Department or the District Magistrate. Local Board.

In 1872, the management of the district roads was entrusted to a committee presided over by the Deputy Commissioner. The funds at their disposal were partly obtained from tolls and ferries on local roads and other

miscellaneous sources, but principally from grants made by the Bengal Government from the amalgamated district road fund. In 1874, when Assam was erected into a separate Administration, the Government of India assigned one-seventeenth of the net land revenue for local purposes. The district improvement fund was then started, and the administration of its resources was, as before, entrusted to the Deputy Commissioner assisted by a committee. The actual amount placed at their disposal was not large, and in 1875-76 the total income of the district funds of the Province was only Rs. 1,85,000, which was a small sum in comparison with the twelve and a half lakhs of rupees received by the Local Boards in 1903-04. In 1879, a Regulation was passed providing for the levy of a local rate, and the appointment of a committee in each district to control the expenditure on roads, primary education, and the district post. Three years later the district committees were abolished by executive order, and their place was taken by boards established in each subdivision, which are the local authorities in existence at the present day.

Functions.

The Local Board is entrusted with the maintenance of all roads within its jurisdiction, except a few main lines of communication, the provision and maintenance of local staging bungalows and dispensaries, and the supervision of village sanitation, vaccination, and the district post. It is also in charge of primary education, subject to the general control of the Education Department, and is empowered to make

grants-in-aid to schools of higher grade, subject to certain rules. For these purposes, it has placed at its disposal the rate which is levied under the Assam Local Rates Regulation of 1879, at the rate of one anna per rupee on the annual value of lands as well as the surplus income of pounds and ferries and some minor receipts. This income is supplemented by an annual grant from Provincial Funds. The principal heads of income and expenditure are shown in Table XVI. The annual budgets of the Board are submitted to the Commissioner for sanction. The estimates for all works costing Rs. 500 or over must be submitted to the Public Works Department for approval, and important works, requiring much professional skill, are made over for execution to that department. Less important works are entrusted to the board surveyor.

CHAPTER VII.

GENERAL ADMINISTRATION.

Land revenue—Native system—Early settlements—The settlement of 1893-94—Expansion of land revenue—Established and fluctuating cultivation—Annual and periodic leases—Land tenures—Collection of land revenue—Tahsildari and mauzadari system—Area of unsettled waste—Excise—Opium—Country spirit—*Laopani*—Ganja—Income tax—Stamps—Public Works—Government—Administration of justice—Registration—Volunteering—Police—Jails—Education—Medical Aspects—Surveys.

**Land
Revenue.
Native
system.**

The system of revenue in force under the Ahom kings was one of personal service. The whole of the adult male population was divided into bodies of three men called *gots*, each individual being styled a *paik*. One *paik* out of the three was always engaged on labour for the State, and while so employed, was supported by the remaining members of his *got*. In return for his labour, each *paik* was allowed 8 *bighas** of *rupit* land, and the land occupied by his house and garden, which is now called *basti*, free of revenue. Any land taken up in excess of this amount, was assessed at annas 4 a *bigha*. In addition to this, the villagers paid a poll tax of one rupee for each adult *paik*.

Buchanan Hamilton, writing in 1809 states that each *pargana* was let for a term of year to a Chaudri,

* One acre = 3 025 *bighas*.

who made what profit he could out of land held in excess of the *paiks'* free grants. The Chaudris are said to have retained for their own use three-fifths of the gross collections, and to have treated the raiyats in a very oppressive manner. The nominal rent per plough of land in Kamrup was Rs. 2 but the exactions of the Chaudri raised it to Rs. 5 or Rs. 7. The yield of a plough was said to be 79 maunds of "rough rice" and 16 maunds of mustard seed, and as estimates of yield prior to the era of crop experiments were generally too high, the area of a plough was probably between four and five acres, and the rates exacted by the Chaudri must at that time have seemed oppressive. These remarks have been quoted, as, in all probability, the system prevailing in Nowgong was not dissimilar from that existing in Kamrup.

On the occupation of the country by the British, ^{Early settlements.} the system of compulsory labour was abolished and the *paik* land assessed to revenue. In 1835, the rates assessed in Nowgong and Kaliabar were four annas a *bigha* on *rupit*, and two annas a *bigha* on *baol* land and land exposed to flood.† *Basti* land was held free of revenue: but a poll tax of one rupee was levied on each adult. In the Mikir Mahal there was no poll tax, but land revenue was assessed at five annas and two and a half annas per *bigha*. In the *chapari*, Raha, Jamunamukh, and Morang no land revenue was assessed, but there was a tax of two or three rupees on each plough, and one rupee on each man cultivating with a spade. A poll tax of one rupee was also levied

† Letter No. 121 from Lieut. Brodie, dated 14-11-1835.

on Doms and Haris, and of five rupee on each Moria or working brass-smith.

The
settlement
of 1868.

Prior to 1868, the rates assessed did not exceed five and a half annas per *bigha*, but in that year the Commissioner, Lieutenant-Colonel Hopkinson, introduced a distinction between *basti* or garden and other land and raised the *bigha* rates to one rupee for *basti*, ten annas for *rupit*, and eight annas for other land. No detailed enquiries were made, there was no attempt to estimate the comparative value of the three different classes of land, there was no discrimination between good and bad land in the same class or even between district and district. The revised rates were, however, so moderate that it was never seriously contended that they would have an oppressive incidence even on the worst land on which they were imposed. Colonel Hopkinson was of opinion that the existing assessment was ridiculously low, and in support of his opinion pointed out that in 1864-65 the receipts from opium were about four lakhs of rupees more than the total land revenue of his division, an excess which in those days, represented a difference of about forty per cent. The new assessment was successfully introduced in 1868-69, and in spite of the enormous enhancement the revenue was collected without difficulty.

The
settlement
of 1893-94.

The next settlement was made in 1893. The three-fold division of land was retained, but instead of imposing the same rate on all land of the same class throughout the district, the villages were

Class	Basti.		Rupit.		Faringati.	
	Rs.	A.	Rs.	A.	Rs.	A.
1st	1	6	1	0	0	12
2nd	1	4	0	14	0	10
3rd	1	2	0	12	0	9
4th	1	0	0	10	0	8

divided into four grades and, as will be seen from the statement in the margin, the rates imposed per *bigha* varied with the class of the village. The villages were provisionally graded by the Director of Land Records and Agriculture, the class in which each village was placed being determined by the demand for land, and not by any intrinsic considerations of the value of the produce, the fertility of the soil, or the profits of cultivation. The demand for land was estimated by ascertaining the density of the population, the proportion of settled to unsettled land, and the proportion of fluctuating cultivation. These lists were sent to local officers for examination, and were modified by them in view of the fertility of the soil, the facilities for bringing the produce to market, and the rents paid by subtenants where ascertainable. This enquiry was carried out by the ordinary district staff within the space of a single cold weather, and the results obtained made no pretensions to scientific accuracy. Such accuracy was considered to be unnecessary, as it was not intended to impose anything like the maximum assessment on the land. The Government had no desire to assess up to its fair share of the value of the produce of the soil, and under these circumstances it was contended that it would be waste of time and money to have recourse to any minute and elaborate classification of the soils, to crop experiments on a large scale, or to a close examination of all the elements that affect the net profits of the cultivator. The theory on which the settlement was based was that the worst

lands were capable of bearing the assessment imposed, and that Government alone was a loser by its inequalities. A fresh settlement of the district, which will discriminate more closely between good and inferior land in the same class is now in progress.

Land in Nowgong town is assessed at a uniform rate of two rupees a *bigha* the place not being of sufficient size and importance to warrant as yet a special settlement of town lands. In the Mikir Hills the people pay a tax of two rupees a house, and no attempt is made to measure up the land that is actually cultivated by them.

Expansion
of land
revenue.

The following statement shows the gradual expansion of the land revenue and the settled area since the district first came under our administration. The figures for years in which a new settlement first came into operation, are printed in italics.

A D.		Rs.		Acres.
1884-85	...	60,475	...	Not available.
1882-83	...	1,53,024	...	176,589
1885-86	...	2,16,660	...	233,117*
1888-89	...	3,53,147	...	Not available
1892-93	...	5,41,144	...	344,522
1893-94	...	6,90,980	...	335,469
1902-03	...	4,67,478	...	265,889

The great decrease between 1893-94 and 1902-03 is primarily due to the destruction of one fourth of the total population by *kala azar*. As soon as the full extent of this appalling calamity had been revealed by the census of 1901, the Government of India directed that,

* Commissioner's letter dated 21-9-1867.

as a measure of relief, the land revenue demand of the district should be reduced by one lakh of rupees, and it is satisfactory to know that at last the tide has turned and that the settled area is once more increasing.

The system of cultivation in the district falls into two main heads, established and fluctuating. In the established area the staple crop is *sali* or transplanted paddy. Land is not readily resigned, and it occasionally possesses a certain market value, though in Nowgong this value has been materially affected by the fearful mortality that has prevailed of recent years. In the fluctuating tracts the staple crops are mustard, pulse, and summer rice, *ahu*, and continual change is one of the essential elements of cultivation, the same field being seldom cropped for more than three years in succession. Most of this fluctuating cultivation is situated on the *chapari*, or tract of land lying between the Brahmaputra and the Kalang.

The bulk of the land on which the staple crops of the district are grown is held direct from Government by the actual cultivators of the soil on annual or periodic leases. The periodic lease confers a right of re-settlement and a heritable and transferable title. Annual leases merely authorise the occupation of the land for a single year, though in practice the rights of transfer, inheritance, and re-settlement are recognized. The only drawback of the annual lease lies in the fact that if the land happens to be required by Government, it can be resumed without payment of compensation to the occupant. Land held under either

form of lease or any individual field within the holding can be resigned, on formal notice of the fact being given to the Deputy Commissioner.

The mandal. The basis of the land revenue system is the *mandal*, the village accountant and surveyor, who draws a modest stipend ranging from Rs. 8 to Rs. 12 per mensem. In March he proceeds to his circle, inspects the fields which have been formally resigned to see whether they have been actually relinquished, tests the boundaries of fields taken up in recent years to see whether they are in accordance with the map, and surveys land which has been broken up for what is called the regular settlement or for which a formal application has been filed. His two principal registers are the *Dagchitha*, in which particulars are entered for each field within the village, and the *Jamabandi* or rent roll, which classifies the fields by holdings and shows the area covered by each lease. During the hot weather he is occupied with the revision of his maps and registers, and the preparation of his leases. When the winter comes, he again proceeds to the field, distributes the leases he has prepared, and surveys the land which has been broken up since his former tour, and which is included in what is known as the *dariabadi* or supplementary settlement. He is also required to prepare statistics of the area under different crops; he assists in the collection of the revenue, and is often ordered to report on local disputes connected with the land. In most Provinces in India, a settlement is concluded for a term of years. During its currency no land which is held on lease can

be resigned, and there is not, as a rule, any appreciable quantity of waste land to be taken up. The state of affairs in Nowgong is very different. In 1902-03, the total settled area was 265,889 acres, the area excluded from settlement was 26,651 acres, and the area of land newly included in settlement 34,685 acres. It must not, however, be supposed that this kaleidoscopic shifting of the fields is taking place in every portion of the district, and that everywhere may be seen the spectacle of cultivated land becoming jungle and jungle land changing into fields of waving rice. In the established portion land is seldom given up, but in the fluctuating area, as has been already explained, it is less trouble to burn the jungle and break up new land every second or third year, than to clean the fields of the weeds which spring up after they have been two or three times cropped.

Above the *mandal* comes the supervisor kanungo, a ^{Superior settlement staff.} peripatetic officer on pay ranging from Rs. 30, to Rs. 40, who checks his work both in the field and in the office. The superior revenue officers are called sub-deputy collectors and draw salaries ranging from Rs. 100 to Rs. 200 per mensem. The appointments are usually made by selection from candidates who must be of good physique and moral character, of respectable family, under 25 years of age, and must either have taken a university degree or have read up to that standard

The different tenures in the district fall under two ^{Land tenures} main classes—(1) those under which land is held for the cultivation of ordinary crops, and (2) those under

which grants have been made for the growth of tea or other crops, which are not included amongst the ordinary staples of the Province, and which require a considerable amount of capital for their production. The bulk of the land included in the first class is settled under the ordinary rules at full rates, but there are also considerable areas of revenue free land (*lakhiraj*) and land settled at half rates (*nisaf-khiraj*). In the time of the Ahom kings the whole of this land is said to have been held rent free, but in 1834 the Government of India ruled that "all rights to hold lands free of assessment founded on grants made by any former Government must be considered to have been cancelled by the British conquest. All claims, therefore, for restoration to such tenures can rest only on the indulgence of Government without any right." Mr. David Scott, the first British Commissioner of Assam, found that, even under the Ahom Rajas, these revenue free lands had been assessed at the rate of five annas a *pura*,* and he imposed this cess, which was subsequently raised to eight annas, upon them. The Government of India then directed that an enquiry should be instituted into these claims and that all cases in which land was held on *bóna-fide* grants dating from before the time of the Burmese conquest, or an account of services which were still performed, should be reported to them for orders. These instructions were not fully observed by the Commissioner at that time, Captain (subsequently General) Jenkins. This officer, for reasons which have never

* A *pura*=4 *bighas*, 3 025 *bighas*=1 acre.

been ascertained, drew a broad distinction between *debottar* or temple lands and *brahmottar* and *dharmottar* lands, *i.e.*, lands which were devoted to some religious purpose but were not actually the property of a temple. The former he released from all claims for revenue; on the latter he imposed the rate assessed by Mr. Scott, which happened to be half the full rates prevailing at the time. No report was even submitted to the Government of India and no final orders were ever received from them, but the right of the former class of proprietors to hold free of revenue, and of the latter at half the usual rates, has been definitely recognised. Waste land included within the boundaries of *nisf-khiraj* estates is assessed at 1 anna 3 pies per *bigha*, and as the proportion of uncultivated land in these estates is fairly high, this assessment adds considerably to the gross demand. The total area of *lakhiraj* land in the district in 1903-04 was 2,314 acres and of *nisf-khiraj* land 5,382 acres. The area settled year by year at full rates is shewn in Table XIV.

Two sets of rules were in force for the grant of land for tea prior to 1861. The underlying principle in each case was that the land should be held on long leases at low but progressive rates of revenue, and that precautions should be taken against land speculation by the imposition of clearance conditions. Between 1861 and 1876 the fee simple tenure of waste land grants was put up to auction at an upset price of Rs. 2-8-0 an acre, which in 1874 was raised to Rs. 8. The holders of grants under the earlier rules of 1838 and 1854

Grant of
land for the
cultivation
of special
crops.

were allowed to purchase a fee simple tenure by payment of twenty times the revenue then due, provided that the clearance conditions had been carried out. Advantage was very generally taken of this concession, and there is no longer in the district any land held under the rules of 1838 and only 469 acres under the rules of 1854, while there are 21,349 acres held on fee simple tenure. The existing rules came into force in 1876. The land is sold at an upset price of Re. 1 per acre, for, though it is nominally put up to auction, there is no case on record in which more than one applicant appeared to bid. For two years the grant remains revenue free, and the rates gradually rise to 8 annas an acre in the eleventh and one rupee in the twenty-first year. The lease runs for 30 years, and when it expires the land is liable to re-assessment. The total area settled under these rules will be found in Table XIV.

Collection
of land
revenue :
the small
mausa.

The collection of land revenue was first introduced in Nowgong in 1833-34. Engagements were entered into with the raiyats direct, but the duty of collection was entrusted to a bissoah who received a commission of $12\frac{1}{2}$ per cent., though he was not held responsible for the payment of the total revenue demand, irrespective of the amount that he actually succeeded in collecting. In 1840, a village accountant or kakati was appointed, who received a commission of $2\frac{1}{2}$ per cent., and this, in addition to the grants of land given to the peons, raised the total cost of collection to $16\frac{1}{4}$ per cent., of the revenue realized. In 1839-40, the experiment was tried of making a

settlement with the mauzadar for a term of years, and holding him responsible for any losses that might occur, but allowing him to absorb any profits that accrued from the extension of cultivation. In practice this system was found to be unsatisfactory, and was abandoned, and recourse was again had to the annual settlement under which the fiscal officer was only responsible for the collection of the revenue. Efforts were made to induce respectable mauzadars to take five years leases of the *chapari mahals*, on a commission of no less than 20 per cent. Twenty *chapari* mauzas were settled in this manner, but in every case but one, the mauzadars threw up their leases, and accepted annual settlements on the old rate of commission. The fiscal units at that time were very small and in 1853 there were no less than 158 mauzadars, exclusive of those appointed for the Mikir Hills.*

The general tendency, since that date, has been to increase the size of the unit of collection. In 1867, the mauzadars, as the collecting officers were called, received 15 per cent. of the revenue as commission, and were allowed half the revenue of land reclaimed during the currency of the settlement. Three years later, their commission was reduced to 10 per cent. and in 1872 the further restriction was imposed that this 10 per cent. could only be drawn on the first Rs. 6,000 of revenue, .5 per cent. being allowed on revenue in excess of that sum. In 1883, the idea gained ground that Government would do better by putting

Larger
mauzas and
tahsils.

* *Vide* Report on the Province of Assam by A. J. Moffatt Mills—Calcutta 1854.

the mauzadar aside and employing salaried officials as a collecting agency. Mauzas were accordingly amalgamated and placed in charge of an official called a tahsildar, who was remunerated by a fixed salary and was exempted from the responsibility imposed upon the mauzadar of paying in the revenue on the due dates, irrespective of the amounts actually collected by him. Three tahsils were opened in 1892, at Nowgong, Raha, and Samaguri, an arrangement which left the mauzadars still responsible for 60 per cent. of the land revenue demand. It was subsequently found, that there was some difficulty in dealing direct with so large a body of raiyats, and in 1904, the tahsils were again broken up into mauzas.

**Compulsory
realisation
of revenue.**

The revenue demand on account of the regular settlement is due in two instalments ; three-fifths on January 15th, and two-fifths on the 15th February, except in those villages which meet the government demand from the sale of mustard and pulse when it is due in one instalment on March 15th. The demand on account of the supplementary settlement, is also due in one instalment on that date.

In 1903-04, notice of demand was issued on account of 10 per cent. of the total land revenue demand, but it was only necessary to attach property on account of 2 per cent. The number of cases in which it was necessary to have recourse to sale was very small, and the revenue on account of which property was sold only represented 0·05 per cent. of the total demand.

The figures below show the total area of the district as reported by the Assistant Surveyor General, Calcutta, the settled area, and the area of reserved forests in 1902-03 and the area of waste land at the disposal of Government in that year.

Area of
unsettled
waste.

	Square miles		
Total area of district	...	...	3,843
„ settled area	...	...	415
Area of reserved forests	...	...	142
Area of unsettled waste	...	..	3,286

No less than 85 per cent. of the total area falls in the latter category, but it must not be supposed that the whole of this land is fit for cultivation or human habitation. The figures include the area of roads and of tracts that are permanently under water, which amounts to a very considerable total. It also includes the area of the Mikir Hills, which could never support a dense population, of extensive tracts which are submerged during the rainy season and are hardly fit for permanent habitation, and of land which is too high or barren to be fit for the growth of food crops. It is useless to attempt to form any estimate of the proportion of the unsettled area in which cultivation could be carried on with profit, and it is hardly necessary to do so, as it is obvious that the district could support a much larger population than it now possesses.

The most densely populated portion of the district is the tract of country lying on either side of the Kalang, between Silghat and Raha, but there is not a single mauza in which the area of unsettled land is not extremely large. Nearly one-third of the *sadr* tahsil

was, for instance, unsettled in 1902-03, but this, for Nowgong, is but a small proportion. The following statement shows the unsettled area of the *chapari* mauzas, and there is also an enormous area of waste land in the Kapili valley.

Mauza.		Total area in acres.	Unsettled area in acres.
Juria	...	80,000	76,000
Dhing	...	70,000	39,000
Mikirbheta	...	42,000	31,000
Gerua Bokani	...	98,000	87,000
Ghugua	...	40,000	35,000
Mayang	...	76,000	70,000

Excise :
Opium.

From Table XII it will be seen that excise furnishes nearly three-eighths of the total revenue of Nowgong, and that five-sixths of the excise receipts are derived from the sale of opium. Prior to 1860, no restriction was placed upon the cultivation of the poppy, but the evil effects of unrestrained indulgence in opium were undeniable, and, in that year, poppy cultivation was prohibited, and the drug was issued from the treasury, the price charged being Rs. 14 a seer. This change was bitterly resented by the people, and cost the life of the Assistant Commissioner, Lieutenant Singer, but the story of the Phulaguri riots has already been told in the chapter on the history of the district. The price was quickly raised to Rs. 20 in 1862, Rs. 22 in 1863, Rs. 23 in 1873, Rs. 24 in 1875, Rs. 26 in 1879, Rs. 32 in 1883, and Rs. 37 in 1890, the figure at which it

* Opium is said to have been introduced by some of Captain Welsh's Soldiers and to have been first used as a specific against bowel complaints. The poppy was first cultivated in Beltala near Gauhati and the drug, which was at first regarded as a medicine, soon enslaved the Assamese.

now stands. While Assam was under the Bengal Government, licenses for the retail vend of opium were issued free of charge. In 1874, a fee of Rs. 12 per annum was levied on each shop, and in the following year, it was raised to Rs. 18. Between 1877 and 1883, the right to sell opium in a particular *mahal* was put up to auction, but this system was found to be unsatisfactory, and in the latter year the individual shops were sold as is done at the present day. The general result of the Government policy has been to enormously reduce the facilities for obtaining the drug. In 1873-74 there were in the district 867 shops for the retail vend of opium, whereas in 1903-04 there were only 134.

The following figures show the extent to which the consumption of the drug has been affected by the raising of the rate of duty. 1873-74, 284 maunds; 1879-80, 179 maunds; 1889-90, 243 maunds; 1899-1900, 168 maunds; and 1902-1903, 191 maunds. The population, in the first and the last years of the series, was about the same, though the number of aboriginal tribesmen, who are the chief consumers, was probably smaller in the latter year, but the quantity of opium issued was only two-thirds of the amount sold in 1874. Prior to 1860, when there were no restrictions upon the cultivation of the poppy, the opium habit had taken a firm hold upon the people, and even though it was taxed, habitual eaters were unable to forswear the drug. But the steady rise in price and the diminution in the number of shops, naturally tended to restrict

consumption and to deter the younger generation from taking to the habit. During the first half of the century, opium probably cost the people about Rs. 5 a seer.* Since 1890, the price has varied from Rs. 40 to Rs. 50 a seer, and it is only natural, that such a heavy increase in the cost should be attended with a decrease in the amount consumed.

The drug is generally swallowed in the form of pills or mixed with water and drunk, and is seldom smoked as this is considered to have an injurious effect upon the constitution of the smoker. Madak is made by mixing boiled opium with pieces of dried pan leaf, and stirring it over the fire. The compound is then rolled up into pills and smoked. Chandu is made out of opium boiled with water till the water has all evaporated, and is smoked like madak in the form of pills.

Country
spirit.

The outstill system is still in force in the district, that is to say the right to manufacture and sell spirit at a particular locality is put up to auction, and no attempt is made to levy duty on the actual quantity of spirit distilled. The abstract in the margin shows that of recent years there has been a considerable increase in the revenue derived from country spirits. But the system of auctioning the shops depends for its success upon the existence of competition at the sales, and the lowness of the fees received in 1880 and 1890

	No. of shops.	Revenue.

* Vide Statement XIV appended to a report submitted by the Deputy Commissioner of Darrang, on February 15th, 1836.

suggests that at that time purchasers were able to obtain licenses at practically their own prices. The large increase in the foreign population, most of whom are liquor drinkers, which more than trebled itself between 1881 and 1901, has been the principal cause of the expansion of the trade, as, though the aboriginal tribes are great consumers of liquor, they prefer a strong beer which they brew from rice to ordinary country spirit.

The attention of the Administration has been more than once directed to the discovery of the most effective means of discouraging a taste for drinking, but the most serious obstacle to improvement lies in the fact that, if the supply of licensed liquor is cut off, rice-beer and spirit can be readily manufactured by the people, and complaints have more than once been received of excessive drunkenness on tea gardens which were situated far beyond the reach of any licensed liquor shop. The outstill system is not theoretically the most desirable, but, owing to the difficulty of communications and the facilities that exist for the manufacture of illicit liquor, it has not yet been found possible to introduce any more satisfactory methods in its place. The following measures have recently been introduced with the object of reducing, as far as possible, the evils attendant on the liquor trade. A special excise establishment has been entertained, the vendor is required to arrange for an abundant supply of good drinking water near his shop, and his license can be withdrawn if he is twice convicted of allowing drunkenness and disorderly conduct near the still.

The most important shops are situated at Lumding Jakhlabandha, Nowgong, and Barjuri.

Country
spirit. The
still.

Country spirit is manufactured by native methods and generally in what is known as the open still. The apparatus employed consists of a large brass or copper retort, which is placed over the fire, to the top of which is fitted the still head, a compound vessel, part of which is made of earthenware and part of brass. The wash is placed in the retort, and, as it boils, rises in the form of vapour into the still head, over the outer surface of which a stream of cold water is continually kept flowing. As the vapour cools, it is precipitated in the form of liquid, and is carried off by a bamboo tube into a vessel placed at the side. The mouth of this tube is open, and the spirit trickles from it into the vessel beneath, so that the outer air has access by this channel into the still head and retort in which the process of distillation is going on. In the closed still, the vapour passes down two tubes into two receivers, where it is cooled and condenses into liquid. These tubes are so fixed to the receivers that the air cannot have access to the spirit, and, though distillation does not proceed so rapidly, the liquor produced is stronger than that obtained from the open still.

Material
employed.

The material employed is generally the flower of the mohwa tree (*bassia latifolia*), which contains a very large proportion of sugar, but its place is sometimes taken by molasses and rice. The following are the proportions in which these ingredients are generally mixed : mohwa 30 seers and water 60 seers ; or mohwa 25 seers,

molasses 5 seers, and water 60 seers; or boiled rice 20 seers, molasses 10 seers, and water 80 seers. *Bakhar* a substance composed of leaves, roots, and spices, whose actual ingredients are not divulged by the villagers who manufacture it, is frequently added to the wash, which is put to ferment in barrels. Fermentation takes three or four days in summer and a week in the cold weather, and the wash is then considered to be ready for the still.

The process of distillation takes about three hours. A retort of 40 gallons yields two gallons of spirit in an hour and three-quarters, three gallons in two hours and a quarter, and four gallons in three hours. The best and strongest spirit comes off first, and in the case of a brew of 30 seers of mohwa, the first $3\frac{1}{2}$ gallons will be classed as *phul* if they are at once drawn off from the receiver. If they are allowed to remain while two more gallons are distilled, the whole $5\frac{1}{2}$ gallons will be classed as *bangla*. The exact proportions vary, however, at the different shops, some distillers taking $4\frac{1}{4}$ gallons of *phul* or $5\frac{1}{4}$ gallons of *bangla* from 30 seers of mohwa. Occasionally only two gallons of spirit are distilled from 30 seers of mohwa, and the liquor is then called *thul*, is very strong, and is sold for one or two rupees a quart. *Thul* is also sometimes made by redistilling *bangla*. Only one kind of liquor is generally taken from each distillation as if the *thul* or *phul* were removed, the spirit subsequently distilled would be not only weak but impure. Strong liquor watered to reduce it to a lower strength is not considered palatable, and it

seems to be the usual practice to distil the liquor at the actual strength at which it will be sold. One disadvantage of the cheaper kinds of liquor is that it will not keep, and in four or five weeks it is said to lose all its spirituous qualities.

Laopani.

Laopani, or rice beer, is the national drink of the unconverted tribes, and a special name, *modahi*, is applied to those who have to some extent attained to Hinduism, but have not yet abandoned their ancestral liquor. It is also taken by some of the humble Hindu castes, and is largely used by garden coolies if facilities are not afforded to them for obtaining country spirit. The following is the usual system of manufacture followed: The rice is boiled and spread on a mat, and *bakhar* is powdered and sprinkled over it. After about twelve hours it is transferred to an earthen jar, the mouth of which is closed, and left to ferment for three or four days. Water is then added and allowed to stand for a few hours, and the beer is at last considered to be ready. The usual proportions are 5 seers of rice and 3 chattaks of *bakhar* to some 8 or 10 quarts of water, and the liquor produced is said to be much stronger than most European beers. Liquor is often illicitly distilled from *laopani* or boiled rice, by the following simple method. An earthen pot with a hole in the bottom is placed on the top of the vessel containing the *laopani* or rice, and the whole is set on the fire. The mouth of the upper pot is closed by a cone-shaped vessel filled with cold water, and a saucer is placed at the bottom of the pot over the hole. The vapour rises into the upper of the

two jars, condenses against the cold cone, with which the mouth is closed, and falls in the form of spirit on to the saucer beneath. Care must of course be taken to see that the various cracks are closed against the passage of the spirituous vapour, but this can easily be done with strips of cloth.

Ganja is usually mixed with water, kneaded till it becomes soft, cut into small strips, and smoked. Wild ganja grows very freely in Nowgong but it is doubtful whether it is much used except as a medicine for cattle. It does not produce such strong effects as the ganja of Rajshahi, but the leaves are sometimes dried and mixed with milk, water, and sugar to form a beverage. Ganja is not much used except by foreigners, and from Table XII it will be seen that the revenue raised from this drug is comparatively small. It is imported from Rajshahi in bond by a wholesale dealer, who pays a duty of Rs. 11 per seer when issuing it for sale to the retail vendors. The right of retail sale is put up to auction and in 1904 Rs. 6,898 were paid for the 14 shops that are sanctioned for Nowgong.

The receipts, on account of income tax, are very small and in 1903-04 only amounted to Rs. 6,876. Nearly one-half of this is derived from the salaries paid by companies and private employers, in other words the salaries drawn by managers of gardens and their staff, and about one-third is obtained from 'other sources of income.'

The total number of assesseees under the latter head was only 55. More than half were reported to have

incomes ranging from Rs. 1,000 to Rs. 1,250 per annum, and there were only three assesses with incomes of more than Rs 5,000 per annum. The bulk of the persons assessed on 'other sources of income' were general shop keepers, and the balance was composed of 10 mauzadars, 9 buffalo keepers, 4 contractors, 3 pleaders, a doctor and a teacher.

Stamps.

The receipts under the head both of judicial and non-judicial stamps, are considerably lower than those obtained from any other district in the plains. In 1903-04, they only amounted to Rs. 17,568 under the former head, as compared with Rs. 25,577 in Darrang, the next lowest district in the two Valleys, and Rs. 4,04,169 in Sylhet. The corresponding figures for non-judicial stamps were Rs. 3,923, Rs. 6,396 and Rs. 1,51,623. It is, however, only natural that with regard to this particular item of revenue, Nowgong should stand at the bottom of the list. It has a smaller population than any district in the plains, there is little crime, and very little trade or business to require the intervention of our courts.

Public Works.

Public works are in charge of the Assistant or Executive Engineer, who is stationed at Tezpur, and who has, under his orders, a subdivisional officer with two upper and four lower subordinates in Nowgong.

The department is entrusted with the construction and maintenance of all the larger public buildings. The most important are the jail, the public offices, the circuit house, dak-bungalow, schools, and post and telegraph offices at Nowgong, and inspection bungalows,

on Provincial roads. Rest houses on other roads are maintained by the Local Board. The most important roads which are directly under the department are:—the section of the south trunk road which runs through the district from Nakhola *via* Jagi, Nowgong and Kuwarital to the frontier of Sibsagar, and the road from Amlaki to Kathiatali. It has already been explained that Local Board works, that require professional skill or engineering knowledge, are usually made over to the Executive Engineer for execution. The principal difficulties with which the department has to contend are the absence of an artisan class, and the scarcity and dearness of unskilled labour, and it is to these two causes that the heavy cost of public works in Nowgong is largely due.

Nowgong is not divided into any sub-divisions, and the district is under the immediate charge of the Deputy Commissioner who is allowed two subordinate magistrates as his immediate assistants. Government

The total number of clerks employed in the Deputy Commissioner's office in 1903 was 43, who drew altogether from Government Rs. 20,760 in salaries. Separate officers are in charge of the Police, Forests, Public Works, and Medical Department.

Appeals lie to the Deputy Commissioner from orders passed by magistrates of the second or third class, and from the orders of first class magistrates to the Judge of the Assam Valley. Appeals from the Judge lie to the High Court of Fort William at Calcutta. In 1902, there were four stipendiary and two honorary Criminal
and Civil
Justice.

magistrates in the district and the former decided 1,072 and the latter 210 original criminal cases. In the course of these proceedings 3,148 witnesses were examined. Altogether there were 965 cases under the Penal Code returned as true, the immense majority of which were either offences against property or against the human body. There is little serious crime in Nowgong and most of these offences were either petty assaults or thefts of small sums. Civil work is not heavy, and the Deputy Commissioner acts as sub-judge while one of the assistant magistrates discharges the functions of a munsif. In 1902, the sub-judge heard 5 original cases and 45 appeals, while 1,262 original suits were disposed of by the munsif. Almost all of these cases were simple money suits and nearly three-fourths were disposed of without contest. Special rules are in force for the administration of criminal justice in the Mikir Hills. The jurisdiction of the High Court is barred and the Deputy Commissioner is empowered to pass sentences of death, transportation, and imprisonment exceeding seven years subject to the confirmation of the Local Government. Fine and imprisonment may be awarded in lieu of any other punishment, provided that the amount of punishment awardable for such offence under the Penal Code be not exceeded, and no appeal lies of right from any sentence by the Deputy Commissioner of less than three years imprisonment.

Registration.

The Deputy Commissioner is also the Registrar of the district, and one of the assistant magistrates acts as sub-

registrar. The number of documents registered is, however, very small, and in 1903 only amounted to 219, a fact which shows in a very striking manner how extremely simple is the economic organization of Nowgong.

Nowgong like most of the districts in Assam has no regular garrison, but a certain number of the Euro-^{Volunteer-}pean residents have been enrolled as volunteers. A corps of mounted infantry was first raised in Nowgong in 1888, with a strength of 30 members, and three years later, the volunteers in the four upper districts of the Valley, were formed into one corps known as the Assam Valley Mounted Rifles, which in 1896, was converted into a regiment of Light Horse. The strength of the corps in 1903, was 312, 21 of whom were residing in Nowgong.

The civil police are in charge of a District or Assis-^{Police.}tant Superintendent of Police. The sanctioned strength consists of one inspector, 15 sub-inspectors, and 177 constables. Ninety-one smooth bore Martinis are allotted to Nowgong and a reserve of men is kept up at the district headquarters, who are armed with these weapons and are employed on guard and escort duty. Up-country men, Nepalese, and members of the aboriginal tribes are usually deputed to this work, though attempts are made to put all the constables through an annual course of musketry. There is very little organized crime, and the actual police duties are comparatively light. Table XIX in the Appendix shows the places at which there are investigating centres and the strength maintained at each.

Jails.

The only jail in the district is situated at Nowgong, and has accommodation for 49 male convicts and 14 under-trial prisoners. The jail premises, which cover an area of almost three acres, were originally surrounded by a wall of masonry. Parts of this wall were thrown down by the earthquake of 1897, and the gaps have since been filled up with a bamboo palisade. Most of the wards are built of timber and bamboo with roofs of thatch. Female prisoners are transferred to Tezpur and male convicts sentenced to more than three months' imprisonment to Gauhati. The prisoners are principally employed on gardening and oil pressing.

Education.

During the first half of the nineteenth century, the condition of education in Bengal was bad enough, but in Assam it was even worse. In 1841, Mr. Robinson of the Gauhati College described the state of education in the Valley as being "deplorable in the extreme."* He pointed out that unlike the Province of Bengal, where every village had its teacher supported by general contribution, provincial schools had only recently been introduced in Assam. In 1847-48, there were no secondary and only 10 primary schools in the district. The next few years witnessed very little progress as on the occasion of Mr. Mill's visit in 1853, there were only 13 schools of all grades.

In the following year, Major Butler reported that there were 14 vernacular schools, with 836 pupils on the rolls, but he drew a gloomy picture of the state of education in the district. "The proficiency attained

* A descriptive account of Assam, page 277.

by the boys at these institutions is very low indeed, few stay longer than is sufficient to enable them to read and write a common petition and acquire a little arithmetic, with a slight knowledge of the surveying in use in Assam. When their education is, in their own opinion, complete, they are qualified to become village Kaguttees or writers. One of the greatest impediments to the advancement of education in Assam, is the indifference with which it is received by the respectable classes. They show no wish whatever to see the rising generation educated or made wiser than themselves: in fact, I am half inclined to think, that, if the higher classes could prevent the youth of Assam from being instructed, they would not hesitate to do so."†

1874-75 is the first year for which complete statistics are available, and the following abstract shows the progress of education since that year. Figures for years subsequent to 1900-01 will be found in Table XXI.

Year.	No. of secondary schools.	Pupils.	No. of primary schools.	Pupils.	Total no of pupils.	No. of persons in district to each pupil.	PERCENTAGE UNDER INSTRUCTION TO THOSE OF SCHOOL GOING AGE.	
							Males.	Females
1874-75	9	487	81	2,316	2,803	92	...	...
1880-81	7	582	100	2,282	3,864	82	11.42	0.42
1890-91	5	539	175	5,158	5,677	61	20.62	
1900-01	5	430	112	4,063	4,493	58	21.79	0.76

The column showing the total number of pupils suggests that education is not spreading but receding, but

† Travels and adventures in the Province of Assam, by Major John Butler, p 239, London, Smith Elder and Coy, 1855.

this of course is not the case. Each of the years selected shows an increase in the proportion of the people under instruction, and though there was but little spread of education during the last decade, to those acquainted with the calamities from which the district has been suffering this can hardly be a matter for surprise.

**Secondary
education.**

The schools of the district are divided into five grades, high, middle English, middle vernacular, upper primary, and lower primary. There is only one high school in the district which is situated at Nowgong.

The boys at this school are taught from the earliest stage of their education up to the Entrance course as prescribed by the University of Calcutta, but many leave school without completing the course. Till recently English was taught in all the classes. The smaller boys no longer learn that language, but the standard of instruction is higher than that prevailing in lower secondary (middle) schools. English is the medium of instruction in the first four classes of high schools, in the lower classes and in other schools the vernacular is employed. The course of instruction at middle English and middle vernacular schools is the same, with the exception that English is taught in the former and not in the latter. The following are the subjects taught in the middle vernacular course :—

(1) Assamese, comprising literature, grammar and composition, (2) History of India, (3) Geography, (4) Arithmetic, (5) Elements of Euclid (Book I), Mensuration of plane surfaces and surveying, and (6) simple lessons in botany and agriculture. There are only five middle

schools in Nowgong, which are situated at Nowgong town, Raha, Demow-Salmara, Puranigudam, and Silghat.

Primary education is again divided into upper and lower, but in 1903-04 there was only one upper primary school in the district. The course of study in lower primary schools includes Reading, Writing, Dictation, Simple Arithmetic, and the Geography of Assam. In upper primary schools the course is somewhat more advanced, and includes part of the first book of Euclid, Mensuration, and a little History. The standard of instruction given still leaves much to be desired, but efforts have been recently made to improve it by raising the rates of pay given to the masters. Fixed pay is now awarded at average rates of Rs. 8 per mensem for certificated and Rs. 5 per mensem for uncertificated teachers, supplemented by capitation grants at rates ranging from 3 annas to 6 annas for pupils in the three highest classes. For educational purposes, the district is in charge of a Deputy Inspector of schools who is assisted by two sub-inspectors.

The district is in the medical charge of the Civil Surgeon who is stationed at Nowgong. It contains ten dispensaries, and the supervision of the work done at these institutions is one of the most important duties of the Civil Surgeon. He also controls and inspects the vaccination department, and is required to visit and report on all tea gardens on which the death rate for the previous year has exceeded 7 per cent.

The conditions under which the people pass their days are far from conducive to a long mean duration

of life. Their houses are small, dark, and ill-ventilated, and the rooms in summer must be exceedingly close and oppressive. They are built upon low mud plinths and are in consequence extremely damp, and the inmates, instead of sleeping on beds or bamboo platforms, which would cost them nothing to provide, often pass the night on a mat on the cold floor. Their attire, which is suitable enough for the warm weather, offers but a poor resistance to the cold and fogs of winter, and many lives are annually lost from diseases induced by chills, which might have been avoided by the purchase of a cheap woollen jersey. The houses are buried in groves of fruit trees and bamboos, which afford indeed a pleasant shade, but act as an effective barrier to the circulation of the air, and increase the humidity of the already over-humid atmosphere. Sanitary arrangements there are none, the rubbish is swept up into a corner and allowed to rot with masses of decaying vegetation, and the complete absence of latrines renders the neighbourhood of the village a most unsavoury place. The water supply is generally bad, and is drawn either from shallow holes, from rivers, or from tanks in which the villagers wash their clothes and persons. All of these are undoubtedly factors which contribute to produce a high mortality, and nearly every one of them could be eliminated.

Vital
statistics.

Vital statistics are reported by the *gaobura* or village headman to the mandal of the circle, this report being in theory submitted every second week. In practice they were received at much longer intervals, as the *gaobura*

was an unpaid servant of Government and not very amenable to discipline. It has recently been decided to allot to each *gaobura* $2\frac{2}{3}$ acres of land revenue free, and it will now be possible to enforce a stricter adherence to the rules. Between 1891 and 1901, the mean recorded birth rate was 24 per mille, the death rate 45 per mille and it is certain that both of these figures were much below the truth. The statistics of age recorded at the census are, however, so unreliable, and the disturbing effect of immigrants is so great that it is not possible to fix a normal birth and death rate for the district. It is, however, fairly clear that the exceptional unhealthiness of the last decade not only killed off the people, but had a prejudicial effect on the fertility of the survivors. The number of children under 10 to every thousand of the population decreased from 329 in 1891 to 313 in 1901, and similar decreases were to be seen in Sylhet and the Khasi and Jaintia Hills where public health was also bad.

Epidemics of cholera from time to time produce a high mortality, for though it is apparently endemic in the district, it occasionally breaks out with quite exceptional violence. The abstract in the margin shows

		Cholera death rate per mille.
1879	...	11.9
1884	...	9.0
1886	...	10.1
1890	...	9.9
1893	...	9.7
1900	...	25.0
1908	...	6.7

the recorded death rate from this cause in the years when cholera was most prevalent. For the purposes of comparison it may be added that the death rate in England from all causes in 1901 was only 16.9

per mille. In 1900, the recorded death rate in Nowgong from cholera alone was nearly 50 per cent. higher than the total death rate for England in the following year.

The distribution of cholera varies considerably from year to year, and is by no means confined to the villages that line the banks of the sluggish Kalang. In 1900, there was a terrible outbreak on the *chapari* from Dhing to Nij Tetelia, Ghugua and Dandua being the places most affected. The recorded death rate per mille from cholera in these mauzas in that year was as follows: Dhing, 58; Mikirbheta, 73; Ghugua and Dandua, 124; Charaibahi, 109; and Tetelia 63. It will be seen that the cholera death rate in these mauzas was much higher than the cholera death rate in the three tahsils at each of the four great epidemics,* though the Kalang flows through all the three. Mauzas that seem generally to be predisposed to cholera are Kachamari, which lies along the Kalang opposite Nowgong, and Jamunamukh and Kampur in the valley of the Kapili. It does not appear, however, that the Kapili can have much to do with the dissemination

Death rate per mille from Cholera in—

	1890	1893	1900	1903
Samaguri ...	9	10	12	11
Nowgong ...	10	10	13	20
Raha ...	5	17	23	4

* For the first two epidemics the rate is calculated on the population for 1891 for the last two on the population of 1901.

of the disease as Garubat and Kathiatali, which are in close proximity, have been fairly free. The mauzas on the *chapani* that suffered so terribly in 1900 were not very seriously affected by the other epidemics.

Other diseases which are prevalent in the district ^{Other diseases} are worms, diseases of the skin such as itch and ring worm, ulcers, dysentery and diarrhoea, and rheumatic affections. Worms are extremely common and are said to be absorbed into the system through the coarser kinds of plantains. Elephantiasis is rare and only the simpler form of goitre is met with, but that is common, especially in the Mikir Hills. Venereal diseases are practically unknown amongst the indigenous population, though Bengali coolies and other foreigners are not unfrequently affected. Small-pox is endemic and occasionally breaks out in a most virulent form. The highest recorded death rate of recent years was 8·3 per mille in 1898. The people do not seem to be fully alive to the advantages of vaccination and only 32 per mille of the population was protected on the average in each of the five years ending with 1902-03.

The most deadly lethal agent in the district has, ^{Kala Azar.} however, been the mysterious form of fever known as *kala-azar*. The following account of this disease is extracted from the Report on the Census of Assam in 1901.

“When first referred to in the Sanitary Reports of the province, it is described as an intense form of malarial poisoning, which was popularly supposed to be contagious. The Civil Surgeon of Goalpara, however, rejected the theory of contagion, and in 1884 expressed the opinion that *kala-azar* was simply a local name for malarial fever and its consequences. In 1889-90 a

specialist (Surgeon-Captain Giles) was appointed to investigate both *kala-azar* and the so-called *beri-beri* of coolies, and he rapidly came to the conclusion that *kala-azar* and *beri-beri* were merely different names for *anchylostomiasis*, and that the mortality was due to the ravages of the *dochmius duodenalis*, a worm which lives in the small intestine. This theory corresponded with the observed facts to the extent that it admitted, what at that stage of the enquiry could hardly be denied, that *kala-azar* was communicable, the uncleanly habits of the natives of the province affording every facility for the transfer of the ova of the parasite from the sick to the healthy; but the support which was given to Dr. Giles' views by local medical opinion was withdrawn when Major Dobson proved by a series of experiments that *anchylostoma* were present in varying numbers in no less than 620 out of 797 healthy persons examined by him. In 1896, Captain Rogers was placed on special duty to make further investigations, and, in addition to demonstrating various differences of a more or less technical character in the symptomatology of the two diseases, he pointed out that, whereas *kala-azar* was extremely inimical to life, the number of cases of *anchylostomiasis* that terminated fatally was by no means large. The conclusion to which this specialist came, after a very careful enquiry, was that the original view was correct, and that *kala-azar* was nothing but a very intense form of malarial fever, which could be communicated from the sick to the healthy, an opinion which was to a great extent endorsed by the profession in Assam, successive Principal Medical Officers declaring that, whatever *kala-azar* was, it had been abundantly proved that it was not *anchylostomiasis*. The suggestion that malaria could be communicated did not, however, commend itself to the entire medical world, and was criticised with some severity, Dr. Giles writing as recently as 1898—"Dr. Rogers, like a medical Alexander, cuts his Gordian knot by announcing that Assamese malaria is infectious. In this he places himself at variance with not only the scientific but the popular opinion of the entire world." A complete change in popular and scientific opinion was, however, brought about by the development of Manson's mosquito theory, and Major Ross, who visited Assam, in the course of his enquiry into the manner in which infection by malaria takes place, confirmed Dr. Rogers' conclusions, and in 1899 placed on record his opinion that, as stated by Dr. Rogers, *kala-azar* was malarial fever. The principal points of difference between *kala-azar* and ordinary malarial fever lie in the rapidity with which

the former produces a condition of severe cachexia, and the ease with which it can be communicated from the sick to the healthy. The origin of the disease is obviously a matter which must always be open to doubt. Captain Rogers is of opinion that *kala-azar* was imported from Rangpur, where malarial fever was extraordinarily virulent in the early seventies, but this is still a matter of conjecture."

"The first recorded case occurred at Nowgong in 1888, where it was brought from Gauhati by some boys who attended the school there, and in 1889 another centre of infection was started at Raha by a man who came home to die, after contracting the disease in Kamrup. Two years afterwards the infection was conveyed in the same way to Nakhola, and from these three centres the disease gradually spread over the whole district. The inaccuracy of the returns of vital occurrences collected by the unpaid *gaonburas* of the Assam Valley is well known, but it is possible to draw some conclusions from them, provided that the amount of error remains constant, and the recorded birth-rate for Nowgong is such as to justify us in assuming that there has not been any very marked improvement in registration during the last fourteen years. During the five years 1887-91, before *kala-azar* had got a grip on the district, the average number of deaths annually from fever was 4,405. Had this rate been maintained for the nine years ending December 31st, 1900, the total mortality from fever would have amounted to 39,645, but our records, imperfect though they are, show 98,824 deaths as due to fever and *kala-azar*, and we are thus left with a recorded mortality from *kala-azar* of 54,179 out of a population which in 1891 only numbered 347,307 souls. The following account was given by the Deputy Commissioner of the effects of the disease upon the district:—

The state of the district can hardly be realised by any one who has not travelled throughout it, and been into the villages. Deserted *basti* sites are common; a few of the people in such cases removed elsewhere, but most stuck to their houses till they died. In Lalung and Hojai villages, I believe hardly anyone went elsewhere, and these two tribes lost very heavily. There used to be numbers of Hojais in the neighbourhood of Kharikhana; almost all have died; ten or twelve Hojai villages at the foot of the hills near Dabaka have completely disappeared, and Dabaka itself has shrunk from an important trade centre to a miserable hamlet. *kala-azar* is not only merciless in the number of its victims, but also in the way it kills. Men rarely

died under three months, and often lingered two years, sometimes even more. If two or three members of a family were attacked with the disease, all its little savings were spent to support them. *kala-azar* not only claimed victims in a family but left the survivors impoverished, if not ruined. A case which came under my personal notice will show what I mean: I noticed some fine rice land at Ghilani, near Kampur, lying uncultivated, and sent for the *pattadar* to question him about it. He came and said.—“We were three, my father, my elder brother, and myself. They died of *kala-azar*, and we sold our cattle and all we had to support them. Now I am ill, and shall die next year, how can I cultivate the land?” In many instances, an old man or woman, or two or three small children, are all that is left of a large family. In Nowgong, Raha, and Puranigudam are empty spaces where formerly houses stood, and the same sort of thing can be seen all over the district. So much land had gone out of cultivation that it has hardly any value except in the town, near Silghat, and in the Kandali mauza. A man will not buy land when it can be had for the asking.

Since this report was written a new theory has been mooted and it has been suggested that *kala-azar* may after all not be a malarial fever, but may be caused by those curious parasites which have recently been discovered in the spleens of fever stricken patients, and which are known as Leishman-Donovan bodies. Fortunately the disease is now fast dying out in Nowgong, and its origin and treatment are no longer the burning question that they were, but it will be many years before the district will have fully recovered from its ravages.

Native
methods
of mid-
wifery.

The native methods of midwifery unfortunately leave much to be desired. There are very few professional midwives amongst the Assamese and a woman in her confinement is generally attended by her relatives or friends. In difficult cases they can render little help

and recourse is had to Heaven for assistance. An *ojha* or village medicine man is summoned and the first thing that he does is to have a plant called *son borial* pulled up by the roots, as an inspection of these roots enables him to pronounce an opinion on the prospects of the case. The patient is then required to eat a pan leaf, a betel nut, and a small worm found in the plantain tree. While she is doing this, the appropriate *mantras* are recited, a goat or a duck is sacrificed, and as a further precaution *mantras* are written out and tied round her neck and arm, or inscribed on a brass vessel which is placed where her eyes can fall upon it. In cases of false presentation attempts are made to drag the child out by anything that offers, and the abdomen is kneaded in the hope that the foetus may be expelled. In the absence of medical aid, and this aid is seldom to be obtained, the mother, in such cases, generally dies. The confinement sometimes takes place in a small hut which has been specially constructed for the purpose, and the patient's bed generally consists of an old mat laid on the floor. The unfortunate mother receives practically no assistance. If the labour is a natural one, all is well, but if complications arise, the case has usually a fatal termination, and it is probable that many lives are lost owing to a disregard of the rules of cleanliness which are of such paramount importance in these cases.

The natives are not altogether illogical in their therapeutic system, and believing, as they do, that many diseases are caused by the malignant action of some evil

Native
medical
methods.

spirit, they, not unreasonably, try to cure them by incantations, charms, and *mantras*. They have, however, simple prescriptions for some of the commoner ailments which are summarised below :—

(a) For fevers essence of ginger (*zingiber officianale*) prepared from the dried rhizome by maceration and percolation with a decoction of tulsi leaves (*Ocimum Bacilicum*) flavoured with honey as an excipient.

(b) For diarrhoea. Coriander seed (*Coriandrum Sativum*) and dry ginger, one chattak of each, and half a seer of water. This is boiled down to two chattaks. Dose, one chattak twice daily for two or three days, until improvement is maintained.

(c) For dysentery a decoction of turmeric (*Curcuma Longa*) made with lime water. One chattak to be taken twice or thrice daily.

(d) For dyspepsia. A combination of camphor, cloves, catechu, aniseed and rock salt, approximately one grain of each made up into a bolus and taken once daily usually in the morning.

(e) For diseases of the urinary organs linseed tea is given as a demulcent drink, as it is supposed to be efficacious in dissolving vesical calculi.

(f) For inflammatory diseases of the ear gum asafaetida (*Ferula alliacea*), coriander seed and dry ginger are prescribed. Equal parts of each of these are boiled together in a little oil and dropped into the ear when warm.

(g) For bronchitis. Essence of ginger one part, honey three parts, to be taken three or four times daily till relief is obtained.

(h) For diseases of the eye. Catarrhal and purulent ophthalmia are treated internally with a decoction of the bark of titasapa (*Michelia champaca*) flavoured with honey as an adjunct. Externally the eyes are bathed frequently in a decoction of *Tamarindus Indica*.

(i) For splenic enlargement. Internally fresh juice of papaya (*carica papaya*) on a few grains of sugar to be taken two or three times daily. Externally strips of cloth soaked in hot cow's urine are applied frequently over the region of the spleen.

(j) For cutaneous diseases, itch, ringworm, &c. Powdered sulphur made into an ointment with butter as it's basis is applied externally.

(k). For worms. The fresh juice of pine-apple leaves is regarded as an efficacious anthelmintic.

Though there can be little doubt that many lives are annually lost which could be saved by proper treatment, it is satisfactory to know that of recent years there has been a great increase in the facilities for obtaining medical aid, and in the extent to which the people avail themselves of the advantages now offered to them. The first dispensary was opened in Nowgong town in 1863, but of recent years the number has very largely been increased. From the statement below it appears that for every patient treated in 1881,

Increase in
facilities for
obtaining
medical aid.

there were 55 in 1901, while the number of operations performed rose from 16 to 1,159.

			Dispensaries		Patients treated.
			No.		No.
1881	...	...	1	..	1,857
1891	...	...	4	...	34,939
1901	...	...	13	...	101,268

The principal dispensaries are those situated at Nowgong, Puranigudam, Silghat, and Dhing, each of which had a daily average attendance in 1903 of 40 or more. The diseases for which treatment is most commonly applied are malarial fevers, worms, cutaneous disorders, dysentery and diarrhoea, dyspepsia, and rheumatic affections.

Survey.

A professional revenue survey of the district was made at the time when Assam was still a division of Bengal and the maps were published in 1875. They are on the scale of one mile to the inch and shew the sites of villages and the physical features of the country. A smaller map on the scale of four miles to the inch was published in 1882 and brought up to date in 1893. An area of 1,003 square miles which included the more densely populated portions of the district was cadastrally surveyed in the season of 1887 and 1890-91. The maps are on the scale of 16 inches to the mile and in addition to topographical features show the boundaries of each field. Certain areas which were omitted by the professional party were subsequently surveyed by local agency on the basis of a theodolite traverse, and the results obtained from the cadastral survey both by professional and local agency have been utilized in the revision of the one inch maps.*

* The area so surveyed up to September 30th 1900 was 105 square miles.

SIBSAGAR TANK.

ASSAM DISTRICT GAZETTEERS.

VOLUME VII

Sibsagar.

BY

B. C. ALLEN, c.s.

Allahabad:

PRINTED AT THE PIONEER PRESS

1908.

Price Rs. 3.

Ind 7560.6

J. H. Hall fund

PREFACE.

The Gazetteer of Sibsagar is nothing more than a general description of the district as a whole, and does not, as Gazetteers generally do, include a directory. There are, however, hardly any places in the district which are worthy of the name of town, and the little villages in which the people live do not call for a separate and detailed description. Places which are centres of local trade or of some industry have been specified by name, but to attempt to describe each of these villages would merely have resulted in the most tedious iteration. It should be added that the Gazetteer was compiled at a time when Assam was still a separate Province, and that when the Province is mentioned it is to Assam and not to Eastern Bengal and Assam that reference is made. My acknowledgments are due to the Deputy Commissioner for his kindness in examining the work in proof.

SHILLONG :
October 1905. }

B. C. ALLEN.

CHAPTER I.

PHYSICAL ASPECTS.

Area and boundaries—General aspects—Hills—The Majuli—
River system—Geology—Climate—Rainfall—Storms and earth-
quakes—Fauna.

The district of Sibsagar lies between $25^{\circ} 49'$ and $27^{\circ} 16'$ N. and $93^{\circ} 2'$ and $95^{\circ} 22'$ E, and covers an area of 4,996 square miles. On the north it is bounded by the districts of Darrang and Lakhimpur, on the east by Lakhimpur and hills occupied by tribes of independent Nagas, on the south by these hills and by the Naga Hills district, and on the west by the district of Nowgong. Area and boundaries.

Sibsagar falls into three natural divisions. The most populous and important portion is a wide and healthy plain lying between the Naga Hills and the Brahmaputra. North of that river is the Majuli, a great island no less than 485 square miles in area, which is separated from Lakhimpur by the Kherkutia Suti, at one time the main channel of the Brahmaputra, and the Subansiri. On the east, a considerable portion of the Mikir Hills and the upper valley of the Dhansiri have recently been incorporated within the boundaries of the district.

Throughout the whole of its course through Sibsagar, the Brahmaputra is bounded on the south by a belt of flooded land varying from three or four to as much as seven or eight miles in width. The country in this part is covered with high reed jungle, interspersed with The marshes near the Brahmaputra.

swamps or *bils* and magnificent stretches of rich fodder grass. There are few Assamese villages in this tract, and there is little cultivation except of summer rice, followed by pulse or mustard. Such inhabitants as there are, are Miris, whose houses are built on piles which raise them well above the level of the floods, or Nepalese graziers, whose buffaloes wander at will over the marshes and sandy *churs*. West of Bokaghat this strip of inundated country is seven or eight miles in breadth, and affords a splendid shelter for every kind of game. There are patches of tree forest in which wild elephants and mithun can shelter from the noonday heat, and stretches of high reeds impenetrable to any but the largest animals. Here and there in this sea of grass are little muddy pools in which the great rhinoceros loves to wallow, surrounded by reeds and grasses from fifteen to twenty feet in height. There are *bils*, or shallow meres, lying in the bottom of basins carpeted with luscious fodder grass, and enclosed by a wall of jungle. Here the wild pig come and burrow for their food, and the wild buffalo wallow in the water or lie beneath the shade of the gigantic reeds. Near the tree jungle there is higher ground, where the grasses cannot grow so rank and the deer can make their home.

**The Sibsa-
gar plain.**

South of this flooded tract and east of the Dhansiri there is a wide plain, on which there is hardly any jungle to be seen. On the lower land the staple crop is transplanted rice, while the higher levels have been planted out with tea. The landscape, as a rule, is one of rural plenty. On every side stretch fields of waving rice,

and on every side the view is bounded by groves of feathery bamboos, and slender areca palms, in which the houses of the cultivators lie concealed. The tea gardens themselves have little to appeal to the lover of the picturesque. The rows of bushes are pruned down to one uniform level, and the monotony of this expanse of green is only relieved by the cool lines, the factory, and the planter's bungalow. But they have, as a rule, been opened out on forest land, and the noble trees, with which the cultivated portion is frequently shut in, afford a pleasant contrast to the trim neatness of the handiwork of man.

Further south there is a belt of forest along the foot of the hills, but the area under timber is gradually diminishing, and fields of rice and tea gardens are appearing in its place. West of the Disai, the appearance of the plain is diversified by the protrusion of the sub-soil, and rice is often grown in curious depressions, called *hoolas*, which are three or four feet below the level of the higher land. The ground between these *hoolas* is used for grazing, or for the village site, and is often planted out with sugarcane.

The Dhansiri is no longer the administrative boundary of anything more important than a mauza, but, as a matter of fact, it is the natural boundary of Upper Assam. East of that river is a broad fertile plain stretching right through Sibsagar and Lakhimpur to the Noa Dihing. The whole of this plain is very homogeneous in its features. It is healthy, populous, and well cultivated, a country of prosperity and progress.

The Dhansiri the natural boundary of Upper Assam.

West of the Dhansiri it is Central Assam, a country of hill, forest, and marsh, inhabited by primitive tribes of Bodo origin, or by Assamese from the lower part of the valley. This country has only felt to a very modified degree the quickening effects of the great tea industry, and, during the last twenty years, the population has been more than decimated by *kala-azar*, that terrible scourge from which Upper Assam has fortunately been free. The part of Sibsagar that lies west of the Dhansiri differs as much from the part east of that river as Nowgong does from Lakhimpur, or the Jaintia Hills from the Jaintia Parganas.

**The Mikir
Hills.**

The upper valley of the Dhansiri and of the Doiang is covered with dense tree forest which is almost entirely destitute of population. A wonderful view of this forest can be obtained from one of the outer ranges of the Naga Hills. North, east, and west, as far as the eye can reach, there is nothing but a pathless wilderness of trees. In the far distance on the north the blue ranges of the Mikir Hills can be discerned some twenty-five miles away, but on the east and west there is forest *et præterea nihil*. The Mikir Hills consist of a mass of sharply serrated ridges, whose steeply sloping sides are green with creeper smothered trees and the bamboo jungle that springs up on the sites of fallowing *jhums*. The outer ranges are not more than 1,500 feet in height, but further back there are hills whose summits are 4,000 feet and more above the level of the sea. Dotted about amongst these forests are to be found the villages of the Mikirs, villages that sometimes consist of but

one or two huge houses, each of which accommodates a family of truly patriarchal proportions. Of all the tribes upon the north-east frontier, the Mikirs are probably the most amenable to law and order, and it is seldom that a European attempts to penetrate into their jungly fastnesses.

North of the Brahmaputra, again, the country is very different. Nearly all of the Majuli lies too low for the cultivation of transplanted rice, and the staple crops are summer rice and mustard. Much of the country is still under high reed jungle, much under fine tree forest, which is rendered beautiful by festoons and loops of creeping cane. It is a country of luxuriant vegetation, of light sandy soil covered with fresh *dub* grass, of deep pools surrounded by umbrageous trees, of village paths and tracks bordered and carpeted with ferns. There is only one road in the island, which crosses it about the centre, and the inhabitants seem quite cut off from the more strenuous and eager life in the neighbourhood of Jorhat. **The Majuli.**

Outside the Mikir Hills the whole of the district is a level plain. Two small hillocks call for special mention, but only on account of the associations with which they are connected, and not from any intrinsic importance of their own. The Charaideo hill in the Dhopabar mauza was once the burial place of the Ahom kings, and the ruins of their tombs are still to be seen, though they were rifled of their treasures by the Muhammadan invaders in the seventeenth century. The Neghereting **Hills.**

hill is a small eminence near the Brahmaputra on which stands a temple sacred to Mahadeo.

River system.

The whole of the drainage of the district ultimately finds its way into the Brahmaputra. Even at this distance from its mouth, the Brahmaputra is an enormous river. In the cold weather the main channel shrinks to more moderate dimensions, and is surrounded on either side by sandy flats or beds of reeds and grasses. In the rains, when the river is full, it spreads over an enormous extent of country, and from one main bank to the other is a journey of several hours in a canoe or country boat. It is seldom possible to proceed direct, as the various channels of the river enclose numerous large islands. These islands are formed from the silt and sand that impart to the Brahmaputra water its turbid colour, and are formed or washed away, as the main stream slowly oscillates from side to side of the broad strath through which it makes its way.

The tributaries of the Brahmaputra the Dihing and Disang.

During its passage through the district, the Brahmaputra receives many tributaries from the south. On the extreme east is the Dihing, which, for the last few miles of its course, forms the boundary between Sibsagar and Lakhimpur. This river never actually enters the Sibsagar district, and an account of it will be found in the Gazetteer of Lakhimpur. Next to the Dihing is the Disang, which rises in the hills occupied by independent Nagas east of Sibsagar town. It flows a north-easterly course till it reaches British territory, and then curves back and runs westward right along the north of Abhaipur and Silakuti mauzas. When parallel to and about eight miles from Sibsagar town, it takes a bend towards the north,

and finally empties itself into the Brahmaputra after a total course of 136 miles. Its principal tributaries are, on the right bank the Diroi and Dimau, and on the left bank the Taokak and Safrai. The Disang flows in a deep channel and does not change its course, but in the rains it often overtops its banks. The steps which have recently been taken to protect the country in the neighbourhood are described in Chapter IV.

West of the Disang is the Dikho, which rises right up **The Dikho.** in the Naga Hills, where it forms the boundary between British and independent territory. It enters the district south of Nazira, flows past that place and Sibsagar town, and falls into the Brahmaputra after a course of 120 miles, more than half of which, however, lies in the hills. Its principal tributary in Sibsagar is the Darika, which flows a little to the north of Sibsagar town and falls into the Dikho near its mouth. Both of these rivers overtop their banks when in flood, and steps have accordingly been taken to protect the country in the immediate vicinity.

The boundary between Sibsagar and Jorhat is formed **The Jhanzi, Disai, and Kakadanga.** by the Jhanzi, which is 71 miles in length, and, like the other rivers, rises in the Naga Hills. Then comes the Disai (81 miles in length), which flows past Mariani and Jorhat, and in the lower part of its course is called the Bhogdai. This name is said to have been bestowed on it in memory of a feast given by the Ahom Raja to the men he had employed in straightening the river's course. The Kakadanga, which is little more than 40 miles in length, forms the boundary between the subdivisions of Jorhat and Golaghat. These rivers closely resemble one

another in several particulars. They all flow through deep channels and do not change their courses. The bottom is muddy, there is no foreshore, and, unlike the Brahmaputra and its tributaries from the north, there is no alluvial or diluvial action going on. The current as a rule is very slack, but, like all streams rising in the hills, they are liable to sudden freshets, though the Kakadanga is said to be the only one of the three which ever overflows, to the detriment of the villages in the vicinity.

The Dhansiri.

The Dhansiri is the largest river in the district after the Brahmaputra, and, like the others, rises in the Naga Hills. On debouching on the plains it flows a northerly and easterly course between the Naga and the Mikir Hills down a valley which is for the most part covered with dense forest. It passes the town of Golaghat, then makes a bend towards the west, and falls into the Brahmaputra opposite the western end of the Majuli. Its total length is 177 miles.

General tendency of rivers to flow westwards.

West of the Dhansiri the only river of importance is the Diphlu, which for a considerable portion of its course flows parallel with the Brahmaputra. This is a phenomenon which is exhibited in a greater or less degree by almost all the rivers in the district, as the tendency of the drainage is to follow the levels of the country, which naturally fall towards the west. Conspicuous instances of this are to be found in the Tuni and the Gela *bil*. The Tuni is situated in the Majuli, the Gela *bil* in the north of Golaghat; and both of them are merely channels of the Brahmaputra which take off from that river and rejoin it

again at a point lower down in its course.

The greater part of Sibsagar lies too high for the formation of lakes, *bils*, or marshes, and the only ones of any size are situated in the Majuli and the flooded country south of the Brahmaputra. Even here, there are no sheets of water of any considerable size, and, as a rule, the *bils* take the form of deep ponds, very long in proportion to their breadth, which are simply the remains of rivers that have changed their beds. **Bils and marshes.**

The plain is of alluvial origin and consists of a mixture of clay and sand in varying proportions, ranging from pure sand near the Brahmaputra to clay so stiff as to be quite unfit for cultivation. The higher land is apparently the remains of an earlier deposit of alluvium. Mr. Maclaren, in a paper on the Geology of Upper Assam, published in Vol. XXXI, Pt. 4 of the Records of the Geological Survey of India, suggests that the level of the valley is still sinking. Were it stationary, the broad belt of low land lying on either side of the Brahmaputra and many other rivers would soon be raised to flood level by the deposit of the enormous volume of solid matter brought down by these rivers, and would be carried far beyond it by the luxuriant vegetable growth of the country. In the same paper there is an interesting speculation on the formation of the Assam Valley (p. 198—204), but it is too long for reproduction here and cannot easily be summarised. **Geology.**

The only mineral of economic importance in Sibsagar is coal, and even that lies beyond the boundaries **Coal.**

of the district. As, however, much of it is situated in independent Naga territory, and as it is from Sib-sagar that it will be worked, if it is worked at all, it will be convenient to describe these measures in the Sib-sagar Gazetteer. They are situated in the outer ranges of the Naga Hills a little to the south of Nazira, and were visited by Mr. Mallet in 1874-75, whose report will be found in Vol. XII, Pt. 2 of the Memoirs of the Geological Survey of India. To the north-east, the coal measures stretch from the Dikho along the watershed between the Safrai and its tributary the Tiru, while south-west they have been traced to a point due north of Tamlu. According to Mr. Mallet, the data, though insufficient to form an estimate of the total quantity of available coal, show that a large quantity must certainly be there. He roughly calculates that in the Safrai section of the field from the north of the Chota Taokak to the south-south-east of Tirugaon there are about ten million tons of marketable coal, while west of the Dikho there are about seven million tons. There are also two small fields in the valleys of the Jhanzi and the Disai, which have not been very thoroughly explored.

For some years past the Assam Company have worked out small quantities of coal for use in their own factories, but not for sale. The question of constructing a tramway from the Santak siding up the valley of the Dikho and embarking on coal mining on an extensive scale is now under consideration. There are hot springs near the Dimapur road about ten miles from Golaghat, and lime is found in the vicinity.

Sibsagar, like the rest of Upper Assam, enjoys a cold **Climate.** winter and a cool and pleasant spring. In October, the rains begin to stop and the nights grow cool, but the real cold weather does not set in till the following month. How sharp is the change can be judged from the fact that the difference between the average minimum for October and November is no less than 11°. December, January, and February are cold and pleasant and in January the average maximum is only 70°. The lowness of the temperature is partly due to the fogs which, in the cold weather, frequently hang over the valley till the day is well advanced. Though unpleasant in themselves, they help to keep the country cool by diminishing the period during which it is exposed to the action of the sun. In March, the thermometer begins to rise, but the copious rains of early spring prevent the development of a hot weather, and it is not till June that the climate really grows unpleasant. The air is then surcharged with moisture, and the damp heat is trying alike to natives and to Europeans. The average maximum and minimum temperature for each month will be found in Table I.

In the east of the district the average rainfall varies **Rainfall.** from 90 to 95 inches in the year, but between the Dhansiri and the Jhanzi it is only between 80 and 82 inches. The Dhansiri valley itself is, for Assam, unusually dry, and the average rainfall at Dimapur is less than 60 inches. November to February are the four dry months in the year; but the special feature in the rainfall of Sibsagar, as of other districts in Assam, is the heavy rain

in April and May, at a time when precipitation in Northern India is at a minimum. Between April and September there is heavy rain, which ranges from 8 to 16 inches per mensem, and March and October each have an average fall of 4 or 5 inches. The rainfall recorded in each month at six different stations in the district will be found in Table II.

Storms and earthquakes.

Sibsagar is never visited by destructive hurricanes, but during the rains a spell of hot dry weather is often closed by a thunder shower, which immediately cools the air, and is on that account extremely welcome. Hail storms occasionally do damage, especially on tea gardens, but fortunately are very local in their action.

Sibsagar, like the rest of Assam, is liable to earthquakes, and the chronicler of Mir Jumla's expedition describes the alarm produced amongst the invaders by one of these unlooked-for visitations. The great earthquake of 1897 was distinctly felt and did considerable damage, though it was as nothing in comparison with the widespread havoc wrought elsewhere. The treasury at Golaghat was injured, and two brick pillars in the engine house at the Jorhat railway station collapsed in ruins. Some damage was done on tea gardens, and here and there short stretches of road were shaken down to the level of the rice fields. Even in Sibsagar the earthquake was a distinctly singular experience, and, had it not been for the extraordinary violence of the shock between Gauhati and Sylhet, it would have taken rank as quite a serious seismic disturbance.

In the more settled portions of the district wild **Fauna.** animals are becoming very scarce, though they are fairly common in the Mikir Hills and the swamp that lies between them and the Brahmaputra. The list includes elephants, rhinoceros, bison (*bos gaurus*), buffalo, tigers, leopards, bears, wild pig and different kinds of deer, of which the principal varieties are sambar (*cervus unicolor*), barasingha (*cervus duvauceli*), hog deer (*cervus porcinus*), and barking deer (*cervulus muntjac*).

Elephants may not be shot and are usually hunted on the system known as *mela shikar*. Mahouts mounted on staunch and well-trained elephants pursue the herd, which generally takes to flight. The chase is of a most arduous and exciting character. The great animals go crashing through the thickest jungle and over rough and treacherous ground at a surprising pace, and the hunter is liable to be torn by the beautiful but thorny cane brake, or, were he not very agile, to be swept from his seat by the boughs of an overhanging tree. After a time the younger animals begin to flag and lag behind, and it is then that the opportunity of the pursuer comes. Two hunters single out a likely beast, drive their elephants one on either side, and deftly throw a noose over its neck. The two ends of the noose are firmly fastened to the *kunkis*, as the hunting elephants are called; and, as they close in on either side, the captured animal is unable to escape, or to do much injury to his captors, who are generally considerably larger than their victim. The wild elephant is then brought back to camp, where it is tied up for a time and gradually tamed. In the days

of native rule the capture of wild elephants was a prerogative of the crown. The Hathighar which connects the Ladoigarh with the hills is said to have been constructed for this purpose, and tradition has it that on one occasion a thousand animals were taken in this gigantic knedda. The system of *mela shikar* was introduced in the time of Purandar Singh, who levied a royalty of Rs. 10 on every animal captured. Prior to this private individuals were not allowed to hunt at all.*

Elephant hunting was last carried on on an extensive scale in 1903-04, when 82 animals were captured. The district is divided into eight mahals and the right to hunt elephants in each mahal is put up to action; a royalty of Rs.100 is also paid on each beast caught. Rhinoceros live in the swamps near Kajiranga and are now becoming scarce. They breed slowly, and as the horn is worth more than its weight in silver, and the flesh is prized as food, they present a tempting mark to the native hunter. Herds of wild buffalo are found in the same locality, and wild bulls occasionally serve the tame cows that are kept by the Nepalese on the Brahmaputra *churs*. Bison are generally found in the Mikir Hills, and, in the cold weather, sometimes descend to the jungles at their feet.

Steps have recently been taken to form the wide expanse of jungle near Kajiranga, which covers a total area of about 90 square miles, into a game reserve.† Wild animals cause little loss of human life, but, in 1904, are said to have accounted for nearly one thousand head

* Vide Deputy Commissioner's letter No. 70, dated August 23rd, 1852.

† About half of this reserve is situated in the Nowgong district.

of cattle. The number of human beings killed in that year by different animals was as follows :—elephant, 4 ; tigers, 1 ; wild buffaloes, 1, snakes, 4 ; total, 10. Rewards were at the same time paid for the destruction of 12 tigers, 15 leopards, and 13 bears.

Small game include wild geese and duck, snipe, jungle fowl, black and marsh partridge, pheasants and hares.

CHAPTER II.

HISTORY.

Early history—The Kachari kingdom—The Chutiyas—Their downfall—The advent of the Ahoms—Steady growth of their power—Koch and Muhammadan invasions—Budra Singh in 1700 A. D. rules the whole of Assam Proper—The Moamaria insurrection—Invasion of Assam by the Burmese—Occupation of Assam by the British—The manners and customs of the Ahoms—The Paik system—The fighting qualities of the Ahoms—Arbitrary form of Government—Social life—Attitude towards Hinduism—The position of women—Condition of the country in 1824—Restoration of Upper Assam to Purandar Singh and the resumption of his territories in 1838—Plots in 1857—Peaceful progress under British rule—Affairs on the Naga frontier—Archæological remains—Chronological table.

Early history.

It is possible that Sibsagar formed part of the old kingdom of Kamarupa, and that Bhagadatta enlisted levies in Upper Assam before he sailed with his troops down the Brahmaputra, only to fall on the field of Kurukshetra. It is possible that the district was at one time governed by Aryan rulers from the west; but, if this is so, there are practically no records of the period of their occupation; and it is with Bodos and Shans that the history of Sibsagar is concerned, and not with the legendary princes of Hindu mythology. In comparison with Kamrup, which can point to a masonry causeway constructed, so the story goes and so the people genuinely believe, by a king who lived and died before the great

war of the Mahabharata, the history of Sibsagar is but a thing of yesterday. But what it lacks in antiquity it makes up in accuracy and detail, for here we are dealing with a people endowed with the historical sense, a people who compiled the annals of their nobles and their kings, and whose records have most fortunately come down to us.

When the curtain lifts, and it does not lift, as in the rest of the Assam Valley, only to fall again before it rises for the drama of modern history, we find a large part of the district under the dominion of the Kachari king of Dimapur. These Kacharis belong to the great Bodo tribe, which is found not only in the valley of the Brahmaputra but in the Garo Hills and in Hill Tippera far away to the south. They are thought to be a section of the Indo-Chinese race, whose original headquarters are said to have been located in the inaccessible hills and valleys which conceal the sources of the Yang-tse-kiang and Ho-ang-ho, and they seem to have gradually spread in successive waves of immigration over the greater part of what is now known as the Province of Assam. At the present day, a prayer is still in use in North Cachar which refers to a huge pipul tree growing near the confluence of the Dilao (Brahmaputra) and the Sagi. There the Kacharis were born and increased greatly in numbers, and thence they travelled till they reached Nilachal, the hill in Kamrup on which the temple of Kamakhya stands. From Gauhati they migrated to Halali, and finally settled in Dimapur. This account of the migration of the Kacharis is to some extent confirmed by Hindu tradition,

The Kachari
kingdom.
Origin of
tribe.

which describes the line of Narak as being overthrown by foreign invaders, and as being afterwards restored in the person of one of his descendants, Brahmapala.

**Difference
between
Kacharis of
Darrang and
of Dimapur.**

At the time when they moved eastward from Gauhati the tribe seems to have split up into different sections, and there is nothing to suggest that the Kacharis living on the north bank of the Brahmaputra continued to be subject to the king of Dimapur. Originally, no doubt Rabhas, Meches, Garos, Lalungs, Bodo or north bank Kacharis, and Dimasa or the Kacharis of Cachar were all members of the same stock ; but they have gradually grown away from one another, and Bodo and Dimasa are now as dissimilar as French and Spanish. Even in the same district the two sections of the tribe are said to be distinct. The Kacharis in the north of Nowgong are Bodos, and are closely connected with the Kacharis of Darrang ; but they have nothing to do with the Hojais, who are Dimasa and live near the North Cachar and Jaintia Hills. At the time of the Ahom invasion in 1228 A. D. the Kacharis seem to have been a powerful tribe occupying the valleys of the Kapili and the Dhan-siri. The ruins of their capital at Dimapur, which are described at length at the conclusion of this chapter, show that they had advanced a considerable distance on the path of civilization. At the present day this place is buried in dense jungle, and the tract of country between the Mikir Hills and the Assam Range is a howling wilderness almost destitute of inhabitants ; but the remains of tanks and temples found in the Kapili valley

suggest that at one time there must have been fields and houses where there is now nothing but waving reeds and whispering grass.

The history of the Kacharis in Sibsagar is but vague and fragmentary, as, unlike the Ahoms, they have left no annals of their rule. They are said to have engaged in war with Jangal Balahu, a Raja whose fort was situated near Raha in Nowgong; but even the date at which this prince was reigning is uncertain, and we do not reach the solid base of fact till we find them in collision with the Ahoms. The first war broke out in 1490 A. D., when the Ahom king Suhangpha was defeated and driven across the Dikho. The scene of the battle is in itself significant, as it shows that the Kacharis could fight, and fight successfully, at a considerable distance from their capital, and that they could make their influence felt not only in the Mikir Hills and the forests of the Dhansiri but in the fertile plains of Jorhat and Golaghat. But it was not for long that they were to enjoy the pleasant sense of victory. War soon broke out again, and in 1536 A. D. Suhunmung, who was generally known as the Dihingia Raja, advanced up the valley of the Dhansiri, killed the Kachari Raja, Detsung, and sacked his capital, Dimapur. The headquarters of the kingdom were then removed to Maibang in the North Cachar Hills, and from there again to Khaspur in the plains to the south of the Barail, but the subsequent history of the tribe forms part of the history of Cachar and has little or no connection with Sibsagar.

War between
Kachari
kings of
Dimapur and
Ahoms in
15th and 16th
centuries.

The Chutiyas.

It now remains to consider what is known of the history of the Chutiyas, the other section of the Bodo tribe who, at the time of the advent of the Ahoms, shared with the Kacharis the sovereignty of the Sibsagar district. The early history of a semi-savage tribe is naturally veiled in some obscurity, but there seems little doubt that the Chutiyas were members of the great Bodo race, and entered the plains from the north-east. Colonel Dalton, quoting from an ancient chronicle, which is confirmed by local tradition, states that they were originally settled in the hills near the Subansiri river. The tribe lived in large independent villages like the Abors and Miris of the present day. In course of time one Bibar seems to have attained a certain measure of supremacy over the neighbouring villages, and the process begun by the father was carried on still further by the son. He extended his influence over the wild tribes, assumed the title of Lord of the Hills, and, at the head of his followers, descended into the valley of the Brahmaputra. He there defeated a king called Bhadra Sen and founded a capital called Ratnapur, which is said to have been situated in the Majuli or in the North Lakhimpur subdivision. Gaur was at that time still under the rule of a Hindu dynasty, so the eruption of the Chutiyas must have taken place prior to its conquest by the Muhammadans in 1204 A. D. The Chutiya leader assumed the name of Ratnadwaj Pal, contracted an alliance with a neighbouring Raja called Naipal, and generally consolidated his power. He excavated tanks, built temples, and constructed a line of forts along the frontier. He

then asked the king of Kamateswar* to bestow a daughter in marriage upon his son, and on that prince rejecting the proposed alliance with scorn, constructed a road to his territories protected by forts erected at intervals along the line of march, and so alarmed the Kamateswar Raja that his daughter was handed over without delay. Ratnadwaj visited the king of Gaur, and left a son to be educated at his court. The boy died and his body was despatched to his father, who received it when he was building a new city, called in memory of this event Sadiya (the place where the corpse was given).

Ratnadwaj was succeeded by five kings, each of whom bore the name of Pal. The last of the series, Karmadwaj, had one daughter for whose hand there were so many suitors that the king, with a Jephthah like fatuity, decided to submit the selection of his son-in-law to the arbitrament of fate. A flying squirrel was seen hovering over Sadiya, and the hand of the princess was promised to the man who could bring it down with an arrow. A poor young Chutiya was successful, and much to her disgust, the proud princess was united to her lowly spouse. The old king then resigned in favour of his son-in-law, who assumed the name of Nitipal.† Naturally enough he was utterly unfitted for the high position to which he had so

Downfall of
Chutiyas.

* Presumably Kamatapur in Kuch Bihar, which is said to have been founded by Niladwaj, whose grandson Nilambar was conquered by the Muhamadans at the end of the fifteenth century. This date would be too late for the invasion of the Chutiyas, and the expedition against Kamatapur is probably quite mythical.

† According to another version the king left an infant son, for whom Nitipal acted as regent.

suddenly and undeservedly been raised, and the kingdom was soon reduced to a state of anarchy and confusion. The Ahoms seized this opportunity to push home their attacks, and the power of the Chutiyas was broken once for all. Little reliance can, however, be placed upon these legends. The story of the poor Chutiya boy who marries the princess is probably a poetical description of the descent of the tribe into the valley, and of the subjugation of the Hindu dynasty reigning in Lakhimpur. The date of the downfall of the Chutiya Kingdom, according to the Chutiya Buranji, is, moreover, 150 years later than that assigned to this event in the Ahom chronicles, which state that it took place in 1523 A. D.*

**The Ahom
account of
the Chutiyas.**

The Ahom historians say that when they entered Assam in 1228 A. D., the Chutiyas were established at Sadiya, and were masters of the country as far west as the Disang river. Hostilities broke out between the two powers towards the middle of the fourteenth century. In 1376 A. D. the Chutiyas declared that they were ready to make peace, invited the Ahom king to a regatta on the Saffrai river, and put him to death as soon as they had got him into their power. The two tribes continued to live in a state of intermittent conflict, but at the beginning of the sixteenth century the struggle began to assume an acute form. The Chutiyas at first met with a considerable measure of success. They pitched their camp at Dikhomukh, raided the territory of the Ahoms, and were,

* Mr. H. J. Kellner in a manuscript note in the Nowgong office says that it must have occurred before 1503 A. D. The general who conquered the Chutiyas was Phuchunmung Bor-gohain, who was killed in a great battle between the Ahoms and Kacharis at Kaliabar in 1503.

at any rate, not worsted in the engagements that ensued. Another account represents the Chutiyas as extremely stupid. They mistook scarecrows sent down the river on rafts for the enemy, and, when preparing a night attack by water, they were so drunk that they forgot to unmoor their boats. On waking the next morning they were so puzzled to find themselves still in the same place that they at once retreated without attempting to engage the enemy.

In 1523, the Chutiya king began to treat for peace, but declined to accept the Ahom terms, which involved the surrender of ancestral heirlooms in the shape of a gold umbrella and bracelets. The attack was accordingly resumed, and the Chutiya king retreated with his army to the hill Chantan or Chandangiri. The Ahoms in their pursuit experienced the difficulties which at the present day confront our own troops in their trans-frontier expeditions. The soldiers at first retreated, but they were rallied by their officers; and, in the engagements that ensued, the Chutiya king and his son were killed. Their heads were conveyed to the Ahom prince Suhunmung, more generally known as the Dihingia Raja, and placed by him at the foot of the stairs leading to the house of god at Charaideo. The administration of Sadiya was then entrusted to an Ahom noble, and the leading Chutiya families deported to places lower down the valley. But the tribe again rebelled, it was only with difficulty that this fresh revolt was stamped out, and as late as 1572 A. D. an expedition was sent against an insubordinate Chutiya chief.

**The Ahoms
enter Assam
in 1228 A. D.**

Having disposed of the Chutiyas and Kacharis, it is time to turn to the history of the Ahoms, the fierce and warlike tribe of Shans, who, starting from the smallest of beginnings, gradually subjugated the whole of the valley of the Brahmaputra as far as the Manas.*

At the beginning of the thirteenth century, there was a dispute with regard to the succession to the kingdom of Mungmau or Pong in the upper portion of the Irawadi Valley. The unsuccessful claimant to the throne left the capital with his friends and followers, and, after wandering about for some years, crossed the Patkai, and, in 1228 A. D., settled down at the foot of the Naga Hills, in the country which has since been formed into the districts of Sibsagar and Lakhimpur.

When Sukapha, the first Ahom king, arrived in 1228 A. D. he found the Chutiyas ruling in the north with an outpost at Safrai, and the Kacharis in the south with an outpost at Kendaguri, the river Dillih forming the boundary between the two. In the narrow strip of territory near the hills there were a few families of Borahis and Morans, evidently of Bodo origin, whom the Ahom chief absorbed into his clan in the rough and ready manner of that day. The men were invited to a feast and killed, the women taken to wife, and the little colony settled down undisturbed in this no man's land to gradually increase in strength and numbers.

**Steady
growth of
Ahom power.**

The struggles between the Ahoms and the Chutiyas and Kacharis have already been described, but, apart

* The description of the manners and customs of the Ahoms, and much of the history has been taken from old Ahom buranjis, translations of which will be found in the office of the Superintendent of Ethnography.

from this gradual movement of expansion towards the east and west, the early history of the Ahom dynasty contains few incidents likely to attract the attention of the historian. A list of the successive Ahom kings will be found in the chronological table appended to this summary, but many of them are names and nothing more, and of their reigns little or nothing of interest is known. On the whole it seems to have been a cruel and treacherous time ; and in this respect the Ahoms were no better than their neighbours. It is true that the Ahom king was murdered by his hosts at a regatta to which he had been invited by the Chutiyas ; but a similar ruse was employed by the Ahoms against the Tipumias. When they suspected this people of an inclination to rebel, they asked them to a feast, and then put them all to death. Though they sinned against the laws of hospitality, they were evidently unconscious of the heinous character of the offence, and the skulls of their victims were hung up on the Tipam stone to commemorate this grisly banquet.* Arbitrary and tyrannical conduct by the Raja was checked or, rather, ended by the principal ministers of state ; and more than one king who failed to give satisfaction to his duly constituted advisers, met with a sudden end from the knife or spear of the hired bravo.

The first Ahom king to step forth from the position of The petty local prince into that of a ruler who had dealings with the outside world was Suhunmung, or the Dihingia Raja, 1497-1539.

* Amongst the tribes on the North-East Frontier there is no reverence for the salt. In Manipur, in 1891, some Kukis asked some Nagas with whom they had had a dispute to a reconciliation banquet and then murdered them.

Raja, who came to the throne at the end of the fifteenth century. His victories over the Chutiyas and Kacharis have already been described, but he was no less successful in his dealings with the Musalmans and Koches.

The former sent two expeditions up the Brahmaputra Valley, but neither met with much success, and the leader of the second, a Pathan named Turbuk, was killed with most of his followers on the banks of the Bhareli in 1532 A.D. The survivors were made prisoners, and are said to have been the ancestors of the Morias, a degraded caste of Muhammadans who earn their living as braziers in Assam at the present day. It was in this war that the Ahoms are said to have first employed firearms. The Bhareli seems at this time to have been the western boundary of the Ahom kingdom, north of the Brahmaputra. It is recorded that, in 1529 A.D., the king took up his quarters at Bishnath, and ordered his generals to plunder the territory lying west of the Bhareli. Suhunmung, like so many of the Ahom kings, met his end at the hands of an assassin, and was succeeded by Sukhenmung, who is said to have founded a capital at Gargaon near the modern Nazira.

Sukampha,
1552-1611,

helps Koches
against
Muhamma-
dans.

His successor Sukampha enjoyed the throne for nearly sixty years, but he was unable to withstand the victorious armies of the Koch king, Nar Narayan, who occupied Gargaon and extorted tribute from the Ahom Raja. The triumph of the Koches was, however, but shortlived, and about 1614 A.D. Bali Narayan, the grandson of Silarai, Nar Narayan's brother, was compelled to apply to the next Ahom king, Suchengpha or Pratap Singh, for help

against the Muhammadans. The war dragged on in Lower Assam with varying success, but in 1637 the Nawab of Dacca sent up an overwhelming force, which carried all before it. The Ahoms were driven out of Kamrup, and a treaty was made under which the Bar-nadi was accepted as the frontier between Muhammadan and Ahom territory.

Suchengpha enjoyed a long and prosperous reign, but his two successors were unfitted for the greatness they were born to, and were soon deposed. In 1654, Sutumla or Jaiyadwaj Singh came to the throne. Taking advantage of the confusion that ensued when Shah Jahan was deposed by his rebellious sons, he drove the Musalmans out of Kamrup and Goalpara, and for a short time the Ahoms were in possession of the whole of the valley of the Brahmaputra down to the point at which the river turns south to enter the fertile plains of Bengal. Mir Jumla, the Nawab of Dacca, was not, however, the man to brook such aggressions on the territory of the Mughal Empire, and in 1662 he started with a large force for the conquest of Assam.*

No resistance was offered to the Muhammadans during the initial stages of their march, and they occupied the forts at Jogighopa, Srighat, and Pandu near Gauhati, Gauhati itself, and Kajali on the western frontier of Nowgong, without striking a blow. At Simlagarh, which seems to have been in the neighbourhood of Kaliabar, there was a strongly fortified post, upon which even the

* An interesting account by Professor Blochmann of the invasion of Mir Jumla and of the preceding wars between the Muhammadans and Koches will be found in J. A. S. B., Vol. XLI., Pt. I, No. 1, 1872.

big guns of the Muhammadans made but little impression, but the garrison displayed extraordinary cowardice, and the place was captured without difficulty. The Ahoms then attempted to destroy the huge flotilla of boats which accompanied the invading host, but fortune still declined to smile upon them, and they met with no better success than when engaging the enemy by land. Half of their fleet, which is said to have consisted of seven or eight hundred vessels, each armed with a gun, was lost, and the rest were put to flight. If the Musalman historians are to be believed, the river must at that time have been covered with native craft, as the registrar at Gauhati reported that no less than 32,000 boats had visited that town, more than one-half of which it is said belonged to the Assamese.

**Occupation
of Gargaon.**

No further opposition was offered to the advancing host, and on March 17th, 1662, the Nawab entered Gargaon. The Raja and his army had evacuated the town and retreated to Namrup in the south-east. The general placed his headquarters at Mathurapur, a place about seven miles south-east of Gargaon, and established thanas in different parts of the Sibsagar district. But when the rains began to break these isolated posts were exposed to attacks from the Assamese, and had to be drawn in, and the position of the Imperialists was such as to cause dissatisfaction to the men and the gravest anxiety to their generals. They were unable to move about the country, and any stragglers who ventured outside the camp were promptly shot. They were exposed to perpetual night attacks, there was heavy mortality

from fever, and, apart from rice, there was very little food. Salt was sold in the camp for Rs.30 a seer, butter for Rs.14 a seer, and opium fetched as much as a gold mohur per tola. The health of the troops at Mathura-pur became so bad that it was found necessary to move them to Gargaon. It proved to be impossible to retire even this short distance in good order, and the Muhammadans were compelled to abandon their sick and to leave many of their guns sticking in the mud. At the conclusion of the rains the Musalmans began once more to take the offensive, but Mir Jumla's health had become so bad that he was unable to pursue the campaign with any degree of vigour, and a peace was patched up in January 1663. According to the Muhammadan historians, the Ahom Raja agreed to pay a heavy indemnity, and the country north of the Brahmaputra and west of the Bhareli, with Beltala, Damuria, and the Naga Hills on the south bank of the Brahmaputra, were ceded to the Mughal Emperor. It is, however, doubtful whether these terms were ever carried out. This, at any rate, is certain that only a few years later the Ahoms were once more in possession of Kamrup, and the outposts of the Muhammadans were located not on the Bhareli but at Rangamati in the Goalpara district.

The description of Assam in the latter half of the seventeenth century as given by the Muhammadan invaders is full of interest. The road from Kaliabar to Gargaon is said to have passed through well cultivated land, and on every side there were houses, gardens, and orchards. This description hardly holds good of

Assam as
described
by the
historian of
Mir Jumla's
invasion.

the road from Kaliabar to Bokaghat at the present day, but the remains of roads and plinths north of Kajiranga show that what is now a howling jungle inhabited by buffaloes and rhinoceros, must in former days have been the site of prosperous villages.

It is also said that the north bank was better cultivated than the south, a statement that still holds good as far as Goalpara and Kamrup, with which the writer was no doubt most intimately acquainted, are concerned. Rich and poor alike built their houses of wood, bamboo, and thatch, and the people generally seem to have led a simple vigorous life.

**Description
of Gargaon.**

The following description of Gargaon is of sufficient interest to warrant reproduction:—

“The town has four gates built of stone and mortar, the distance of each of which from the palace of the Raja is three *kos*. A high and wide *Al*, very strong, has been made for the traffic; and round about the town, instead of fortifications, there are circular bushes of bamboos, about two *kos* in diameter. But the town is not like other towns, the huts of the inhabitants being within the bamboo bushes near the *Al*. Each man has his garden or field before his house, so that one side of the field touches the *Al*, and the other the house. Near the Raja's palace, on both sides of the Dikho river, are large houses. The bazar road is narrow, and is only occupied by *pan*-sellers. Eatables are not sold as in our markets; but each man keeps in his house stores for a year, and no one either sells or buys. The town looks large, being a cluster of several villages.”

**Products of
country.**

Rice was the staple food, but salt was scarce and dear. Salt of an inferior quality was obtained from the salt wells in the coal measures, but the bulk of the people used the *khar puni* that is so commonly distilled from the ashes of the plantain at the present day. Mangoes were plentiful but full of worms, and sugarcane of three

varieties, black, white, and red, did well. Elephants were evidently a source of wealth, but asses, camels, and horses were rare.

The Raja's palace is described in the most glowing terms, and one cannot help suspecting that the writer was inclined to magnify the wonders he had seen.— **Ra a's palace.**

"The ornaments and curiosities, with which the whole wood-work of the house is filled, defy all description: nowhere in the whole inhabited world will you find a house equal to it in strength, ornamentation, and pictures. The sides of this palace are embellished by extraordinary wooden trellice work. Inside there are large brass mirrors highly polished, and if the sun shines on one of them, the eyes of the by-standers are perfectly dazzled. Twelve thousand workmen are said to have erected the building in the course of one year. At one end of the hall, rings are fastened on four pillars opposite to each other, each pillar having nine rings. When the Raja takes his seat in the hall, they put a dais in the middle of these four pillars, and nine canopies of various stuffs are fastened above it to the rings. The Raja then sits on the dais below the canopies."

Jaiyadwaj Singh did not long survive his expulsion from his capital, and, in 1663, he was succeeded by Chakradwaj Singh. During the reign of this prince the Ahoms re-occupied Gauhati, and there was a serious famine, an occurrence which is most unusual in Assam. According to the old chronicler there was no water in the fields, no field was tilled, and no water could be got except by drawing it from deep wells with ropes. On the death of Chakradwaj, a short period intervened in which the nobles proved too strong for the crown, and between 1670 and 1681 no less than seven princes were placed upon the throne, only to come to a bloody and untimely end. The Muhammadans took advantage of these disturbances to regain possession **Gad har Singh restores order, after anarchy between 1670 and 1681.**

of Gauhati, but they were driven out by Gadadhar Singh, who came to the throne in 1681, and restored to it the prestige which it had formerly enjoyed. Not content with consolidating his power in the plains he despatched expeditions against the Mishmis and the Nagas. By this rigorous policy he reduced to order the hill tribes, who have, whenever the central government was weak, been a source of great annoyance to the dwellers in the valley.

**Rudra
Singh,
1695-1714.**

The zenith of the Ahom power was reached in the reign of Rudra Singh. He founded a new capital at Rangpur, which was built for him by one Ghonsyam, a Bengali, who also constructed a bridge across the Namdang. He despatched two large armies against the Rajas of Cachar and Jaintiapur, one of which marched through the North Cachar and the other through the Jaintia Hills, and brought both of those princes captive to Assam. The Miris and Daflas were enlisted as soldiers in the royal army, and, at this time, the Ahoms seem to have dominated not only the whole of the valley of the Brahmaputra but the outer hills as well. Rudra Singh died at Gauhati in 1714, and the Rudreswar temple was erected there by his son in memory of that sad event.

**Sib Singh
1714-1744.**

His son Sib Singh was a weak prince much under the influence of his wives, whose name has come down to posterity as the excavator of the great tank near which the present station of Sibsagar (Sib's tank) stands. The Daflas seem to have given trouble, and in 1717 the Daflagarh was constructed to keep these mischiev-

ous tribes in check ; but, generally speaking, this long reign was singularly devoid of interest. It is, however, worthy of note that even as long ago as the first half of the seventeenth century, four Europeans are said to have visited Rangpur.

The reign of the next prince, Pramatta Singh, was short and uneventful, and during the incumbency of his successor, Rajeswar Singh, the signs of the decay of the Ahom power became all too clear. The Raja of Manipur was driven from his home and applied to the Ahom king for aid. Orders were issued for the despatch of an expedition, but the nobles to whom the command was entrusted excused themselves on various grounds, and declined the proffered honour. The army lost its way when endeavouring to cross the Patkai, a large number of men perished, and, though ultimately the Manipur Raja succeeded in regaining his dominions, it does not appear that the assistance of the Ahoms materially contributed towards his success.

**Pramatta
Singh,
1744-1751.
Rajeswar
Singh,
1751-1769.**

The alliance between the Ahoms and the Manipuris was, however, cemented by the bestowal of a Manipuri princess, whom Rajeswar Singh elevated to the rank of principal queen.

In 1759, the peaceful tribe of Mikirs are said to have raided on the plains, but little difficulty was experienced in putting down this rising. The Rajas of Cachar and Jaintiapur also made demonstrations on the southern frontier, but, on troops being despatched to Raha, they came to the conclusion that discretion was the better part of valour. Another expedition was despatched

against the Daflas, and the Raja of Khyriem formally tendered his submission and promised to pay a yearly tribute of iron. In 1757, Jorhat was honoured by a visit from the Raja, and he had a temporary residence erected there ; but this town did not become the capital of the Ahom kings till they had been driven from Rangpur by the Moamaria rebels.

**Lakshmi
Singh,
1760-1790.
The Moa-
maria insur-
rection.**

The reign of his successor, Lakshmi Singh, was signalized by the outbreak of the Moamaria insurrection. The causes of this insurrection are not quite clear. According to the chroniclers, a certain Hathidharia Chungi with one Nahor Kachari came to offer their annual tribute of elephants to the king. The elephant which they tendered to the Borbarua was a lean and sorry animal, and, as an expression of his disapproval, he cut off their hair and noses, flogged them, and drove them away. Boiling with indignation at this outrage, Nahor proceeded to the house of a Hari woman, whose daughter he espoused, and from whom he received a set of metal plates, covered with mystical incantations to confound the enemy. He then applied to the Moamaria gosain for help, which was readily afforded him, and the standard of revolt was raised. This is the account given by the Ahom chroniclers, and it differs to some extent from the story as told by the Moamaria gosain at the present day. According to this authority, the leaders of the rebellion were two Moamaras named Nahor Khora and Ragho Neogay, who, after they had been punished for failing to deliver the elephants required, went for assistance to their gosain.

The gosain himself declined to listen to their proposals, but they succeeded in winning over his son Gagin Bardekha, who gave them a weapon consecrated with the magic plates of the Kalpataru. The Kalpataru was a sacred book which Anirudha is said to have obtained from Sankar Deb, though the Ahom chroniclers contemptuously assert that it was the property of a sweeper woman.

From the very first the rebels carried all before them. The royal armies were defeated under circumstances which suggest that men and officers alike were guilty of gross incompetence and cowardice; and Lakshmi Singh was driven from his capital and captured. The insurgents then proceeded to appoint Ramakanta, the son of Nahor Khora, to be their Raja. Marauding parties harried the country on every side, and the misery of the common people was extreme. A report at last gained ground that orders had been issued for the execution of all the former officers of state, and this incited the adherents of the king to make one final effort. The signal for the attack is said to have been given by one of the wives of Lakshmi Singh. Ragho, who was one of the most influential men amongst the Moamaras, had forcibly taken her to wife, and as he was bending down at the *bihu* to offer his largess to a dancing boy, she cut him down with a sword. On the death of their leader the rebel forces were surprised and scattered, and a pitiless vengeance taken that spared neither age nor sex.* The house of the Moamaria mahunt was

Success and
subsequent
defeat of
Moamaras.

* The Moamaras say that 790,000 members of their sect were killed, which is no doubt an oriental exaggeration.

surrounded, and almost the whole of his family was killed before his eyes, while all the officers appointed by the Moamaras were seized and beaten to death. The wives of the rebel prince were treated with savage cruelty. One of them was flogged to death, while two others had their ears and noses cut off and their eyes put out.

**Gaurinath
Singh,
1780-1795.**

**Moamaras
again
victorious.**

In 1780, Lakshmi Singh died, and was succeeded by his son Gaurinath, in whose reign the Moamaria insurrection broke out anew, and with increased violence. At first, the king's troops met with some measure of success, and orders were issued outlawing the rebels and authorising any person to kill any Moamaria he might meet, regardless of time, place, sex, or age. Such orders seem to have been only too well adapted to the temper of the people, and, according to the Ahom chronicler, "the villagers thereupon massacred the Moamaras with their wives and children without mercy." The rebels in their turn were not slow to make reprisals; they plundered the country on every side, and "the burning villages appeared like a wall of fire." The ordinary operations of agriculture were suspended, no harvests could be raised, and famine killed those whom the sword had spared. "The price of a katha of rice rose to one gold mohur, and men starved in crowds under the trees, forsaking their wives and children." The highest Hindus castes are said to have eaten the flesh of cows, and dogs and jackals were devoured by the common people.

In 1786, the rebels under Bharat Singh inflicted a decisive defeat upon the royal troops, and took Rangpur, the capital, by storm. The king fled to Gauhati, and in his

terror even left his wives behind him. His generals remained behind in Upper Assam and carried on the contest with varying success. Troops were despatched to their assistance from Manipur, but most of them were ambushed and cut up, and the survivors had no heart to carry on the struggle. The desolation of the country is thus described by the Ahom chronicler:—"The Matakas harried the temples and the idols of the gods, and put to death all the sons and daughters of our people. For a great length of time our countrymen had no home, some took shelter in Bengal, some in Burma, some in the Daffa Hills, and others in the fort of the Bura Gohain, who was fighting with the Matakas for years and months together." Bharat Singh ruled at Rangpur for upwards of six years, and coins are extant which bear his name; but in 1792 a small British force was sent to the assistance of the Ahom king under the command of Captain Welsh. Gauhati, which had been captured by a mob of Doms under a Bairagi, was re-taken. Krishna Narayan, the rebellious Raja of Mangaldai, was subdued, and in March 1794 Rangpur was re-occupied after a decisive victory over the insurgents. Captain Welsh was then recalled, but the Ahom king was able to keep his enemies in check by the help of sepoys trained on the English system.

A few months after the departure of Captain Welsh, Gaurinath died, and was succeeded by Kamaleswar Singh. The country was still in a state of great disorder. The Daffas, not content with harrying the villages on the north bank, crossed the Brahmaputra and attacked the royal troops near Silghat, but were repulsed

**Kamaleswar
Singh.
1795-1800.**

with considerable loss. Even Europeans were not safe, and a Mr. Raush,* a merchant of Goalpara, who had extended his business operations to Darrang, was robbed and murdered by "naked Bengalis." These freebooters then occupied North Gauhati, but, when they attempted to make good their position on the south bank, they were defeated with heavy loss by the royal troops near Pandu-ghat. The Daflas again harried the Darrang district, and even enlisted Bengali sepoy in their service, but were ultimately conquered and dispersed. Victories were also obtained over the Moamarias and the Khamtis at the eastern end of the valley.

**Final col-
lapse of the
Ahom king-
dom.**

In 1809, Kamaleswar Singh was succeeded by his brother Chandra Kanta Singh. The Bor Phukan or viceroy of Gauhati incurred the suspicion of the Bura Gohain or prime minister and fled to Calcutta and thence to Burma. At the beginning of 1816, a Burmese army crossed the Patkai and reinstated the Bor Phukan, but shortly after their withdrawal Chandra Kanta was deposed, and Purandar Singh appointed in his stead. The banished monarch appealed to the Burmese, who, in 1818, returned with a large force and replaced him on the throne.

They soon, however, made it clear that they intended to retain their hold upon Assam, and in 1820 Chandra Kanta fled to Goalpara, and from British territory began a series of abortive attempts to recover his

* This Mr. Raush was the first European to interfere in the affairs of Assam. He sent 700 burkandazes to Gaurinath's assistance, but they wore out up to a man. A mass of masonry, the size of a small cottage, covers the remains of Mr. Raush's infant children at Goalpara.

lost kingdom. The Burmese were guilty of gross atrocities during their occupation of the country, the villages were plundered and burnt, and the people were compelled to seek shelter in the jungle. Women who fell into their hands were violated with every circumstance of brutality, and the misery of the unfortunate Assamese was extreme. Fortunately for them, causes of quarrel had by this time arisen between the British and the Burmese. In 1824, war was declared by the British Government, and a force was sent up the valley of the Brahmaputra, which occupied Rangpur in January 1825, and compelled the Burmese to retire to their own territories, while in the following year, by the treaty of Yandaboo, Assam was ceded to the East India Company.

The above is but a brief account of the rise and fall of the Ahoms. It now remains to consider what is known of their social institutions, and the conditions under which those subject to them passed their lives.

**Ahom Administration.
The paik system.**

The most striking feature in the economy of the Ahom state, and one which (to judge from their conduct since they came under our rule) must have been extremely repugnant to the people, was the system of enforced compulsory labour. The lower orders were divided up into groups of three or four called *gots*, each individual being styled a *powa paik*. Over every twenty *gots* was placed an officer called *bara*, over every five *baras* a *saikia*, and over every ten *saikias* a *hazarika*. In theory one *paik* from each *got* was always employed on duty with the state, and while so engaged, was

supported by the other members. The Raja and his ministers had thus at their disposal a vast army of labourers to whom they paid no wages, and for whose maintenance they did not even have to make provision. It was this system which enabled the Ahom Rajas to construct the enormous tanks and great embankments, which remain to excite the envy of a generation, which has been compelled to import from other parts of India almost all the labour required for the development of the Province and its industries. Many of the works constructed were of undoubted utility, but many, on the other hand, were chiefly intended for the glorification of their designers. Few objects are more worthy of the attention of an enlightened government than the supply of wholesome drinking water to the people. But the huge reservoirs, constructed by the Ahom kings, were out of all proportion to the population which could by any possibility have made use of them, while the close proximity in which these enormous tanks are placed is ample evidence that practical utility was not the object of their construction. On the other hand, embankments which were thrown up along the sides of some of the rivers near the capital, protected land which has become unculturable since they have fallen into disrepair. The duty of providing the various articles required for the use of the king and the nobility was assigned to different groups, which were gradually beginning to assume the form of functional castes. The rapidity with which these groups abandoned their special occupations, as soon as the pressure of necessity was removed, is a clear indica-

tion of the reluctance with which they must have undertaken the duties entrusted to them.*

But though the common people seem to have been ^{War.} compelled to supply an unnecessary amount of labour in times of peace, it was when war was declared that their sufferings were most pronounced. Certain clans of *paiks* were called out, and called out, it would seem, in numbers that were in excess of the actual requirements of the case; an error which entails the most disastrous consequences when the campaign is carried on in a country where supplies are scarce and communications difficult.

According to the Ahom chronicler, nearly 40,000 troops were despatched during the reign of Rajeswar Singh to reinstate the Manipuri Raja on the *gaddi*. Their guides, however, failed them, they lost their way in the Naga Hills, and about two-thirds of the soldiers perished, the mortality being chiefly due to famine and disease. The military dispositions even of Rudra Singh, one of their greatest princes, suggest a want of due deliberation in design and a feebleness and lack of method in execution. In his expeditions against the Kachari and Jaintia Rajas the Ahoms lost 3,243 persons, and the practical results obtained seem to have been insignificant. The Jaintia Raja is himself ready to accept the Ahom king as his suzerain, but cannot impose his

* The system of enforced labour was no doubt unpopular, but it had much to recommend it. It taxed the people in the one commodity of which they had enough and to spare, *i. e.*, labour. It also developed them on the industrial side, and the material comfort of the Assamese would possibly have been greater at the present day if they had not all of them been allowed to devote themselves exclusively to agriculture.

will upon the independent hillmen, who owe him but a nominal allegiance, and who decline to surrender their freedom at the bidding of their king. The Kachari prince sends tribute, but only "a string of pearls, a dugdagi (locket) and a horse;" assuredly a very small return on the quantity of human life and treasure expended. It must at the same time be admitted that the loot obtained on this occasion was not inconsiderable. It included three large cannon, 2,373 large and small guns, 12,000 pieces of silver, 143 gold embroidered coats, 63 elephants and 11 Turkey horses, besides other things; and, more valuable perhaps than all, over 2,000 human beings. At the conclusion of this dangerous and troublesome expedition, each *paik* received a gratuity of four annas, *batta* which would hardly satisfy the sepoy of to-day. The descriptions of the campaigns against the Moamarias, given by the Ahom chroniclers, clearly show that the generals were often guilty of incompetence and cowardice, while the rank and file do not seem to have fully realized the dangers that beset a defeated army. Conditions such as these must of necessity have been disastrous to the private soldier.

**Muhamma-
dans des-
cribe Ahoms
as brave
soldiers.**

The Muhammadan historians of the invasion of Mir Jumla give, however, a more favourable account of the Ahom military dispositions.* Their resources seem to have been considerable, and, in the course of the expedition, the Muhammadans captured 675 guns, one of which threw a ball three "mans" in weight, besides a large

* An interesting account of this invasion will be found in the Journal of the Asiatic Society of Bengal, Volume XL1, Part, 1, pages 49—100.

number of matchlocks and other field pieces. No less than 1,000 ships were taken, many of which could accommodate three or four score sailors ; and in the naval engagement which took place above Silghat in March 1662 A. D. the Assamese are said to have brought seven or eight hundred ships into action. The Ahoms are described as strongly built, quarrelsome, bloodthirsty, and courageous, but at the same time merciless, mean, and treacherous. They were more than equal to the Muhammadans in a foot encounter, but were much afraid of cavalry. This *corps d'élite* did not, however, exceed some 20,000 men, and the ordinary villagers, who were pressed into the service, were ready to fling away their arms and take to flight at the slightest provocation.

Another factor, which cannot but have re-acted unfavourably upon the common people, was the uncertainty of tenure, under which both the ministers and king held office. A perusal of the Ahom chronicles leaves the reader with the impression that the ministers were continually being deprived of their portfolios, and not unfrequently of life itself. Hardly less precarious was the position of the king, and, in the short space of 33 years, between 1648 and 1681, no less than two monarchs were deposed, and seven came to a violent end. Good government, as we understand the term, must have been impossible under such conditions ; and we may be sure that the people suffered from this constant change of rulers. Buchanan Hamilton, writing at the beginning of the nineteenth century, states that the administration of justice under Ahom rule was fairly liberal. Important trials were

Uncertainty
and arbitrary
character
of Govern-
ment.

conducted in open court, the opinion of assessors was consulted, the evidence was recorded, and capital punishment was only inflicted under a written warrant from the king. It is true, no doubt, that few persons possessed the power of imposing the death sentence. But they were allowed to inflict punishments which the victim could hardly be expected to survive, and his position was not unlike that of the heretic delivered by the inquisition to the civil arm, with the request that "blood may not be shed."

**Instances
of this.**

Abundant evidence is available in the Ahom chronicles to show the arbitrary way in which the royal authority was exercised. The following instances are quoted from the reign of Pratap Singh, 1611—1649 A. D. A Katak, or envoy charged with diplomatic relations with foreign powers, asked the Muhammadan commander on his frontier to supply him with two jars. His conduct was reported to the king, who immediately ordered him to be put to death. Another Katak reported that he had heard from a down-country man that a Muhammadan force was advancing up the valley. The king enquired of the Katak responsible for watching the movements of the enemy whether this information was correct. This man declared that he was unable to obtain any confirmation of the rumour, whereupon the first Katak was executed for presuming to meddle in matters with which he had no concern; a proceeding which seems to have been hardly calculated to ensure the supply of timely and accurate information. Three merchants then endeavoured to establish friendly relations between the Nawab of Dacca and the Ahom king. The latter prince took umbrage at

such unwarrantable interference in affairs of state, and ordered the merchants to be put to death. It subsequently appeared that the facts had not been correctly represented, and the Bor Phukan and two other men responsible were promptly killed. A few years later the king transported a large number of persons from the north to the south bank of the Brahmaputra, warning them that any one who attempted to revisit his former home would suffer the penalty of death with all his family "even to the child in the womb." Five hundred men attempted to return, as they wished, the chronicler informs us, to rear a brood of silkworms. The king had them arrested, and 300 were put to death, the remainder escaping in the darkness of the night.

The following incident that occurred in the reign of Lakshimi Singh (1769—1780) is typical of the uncertainties of the times. One Ramnath Bhorali Borua, an officer of state, had the presumption to appear mounted in the presence of his official superior, the Borborua. A complaint was promptly laid before the king, who directed that both Ramnath and his brother should be deprived of sight. The injured man was not, however, destitute of friends, and came with his complaint to the Kalita Phukan, who had his private reasons for desiring the downfall of the Borborua. The Phukan went to the king, poisoned his mind against his minister with the suggestion that a conspiracy was on foot, a suggestion which in those days must always have seemed plausible enough, and, in a short time, the heads of the haughty Borborua, his two uncles, and his brother were rolling

Savage punishments: an official blinded for not dismounting before his official superior.

in the dust. It is needless to multiply instances of the savage violence of the times, but the different forms of punishment in vogue call for some remark. Where life was spared, the ears, nose, and hair were cut off, the eyes put out, or the knee pans torn from the legs, the last named penalty generally proving fatal. Persons sentenced to death were hung, impaled, hewn in pieces, crushed between two wooden cylinders like sugarcane in a mill, sawn asunder, burnt alive, fried in oil, or, if the element of indignity was desired, shorn of their hands and feet and placed in holes, which were then utilized as latrines.

In the seventeenth century it was no uncommon thing to compel conspirators to eat their own flesh, and more than one case is quoted in which the father was forced to eat the liver of his son, a meal that was usually his last in this world. Punishment too was not restricted to the actual offender, but his wretched wife was liable to be handed over to the embraces of a Hari. Methods such as these could hardly fail to have a terrifying effect on much more hardened criminals than the Assamese.

**Social life
amongst the
Ahoms.**

The native chroniclers are naturally most concerned with the wars and religious festivals, which bulked so largely in the eyes of the historians of the day, and with the rise and fall of successive families of ministers. It is only incidentally that light is thrown on the social conditions of the people. The kings seem to have indulged in frequent tours about their territories, the itinerary usually followed being Rangpur, Sonarinagar, Tengabari, Dergaon, Jaliarang, Bornagar, Bishnath, and Kaliabar.

They were fond of fishing and shooting, and fully appreciated the excitement to be obtained from the hunting of wild elephants. On the occasion of coronations and royal weddings, a week was generally devoted to the festivities, which seem, however, to have consisted for the most part of prolonged feasts, accompanied by much unmelodious music. Towards the end of the eighteenth century, acrobats and jugglers were imported from Bengal, who amused their royal patrons with tricks which are still shown to the tourist on the P. & O. Kamaleswar Singh visited in state the two principal *sattras* of Auniati and Dakhinpat, and was entertained with all his retinue by the gosains. The chronicler quaintly tells us that the lunch at Dakhinpat gave greater satisfaction than the one at Auniati; but does not say whether this was due to the superior skill of the Dakhinpatia cook, or to the greater beauty of the *sattr* precincts.

The first Hindus to influence the Ahom kings were saktists, and Pratap Singh (1611—1649) persecuted the Vaishnavites, one of whose leaders had converted his son to Hinduism. The disciples of the gosains were seized, human ordure was placed on their foreheads, and they were degraded to the sweeper caste. To be found in the possession of religious books meant death, not only to the actual owner, but to every member of his family. Even Pratap Singh's spiritual pastors were not spared, and he denounced the new religion which, in spite of the adherence of the Raja, had not been able to save from death his own beloved son. He then assembled 700 Brahmans,

Attitude of
Ahoms to-
wards Hin-
duism.
Savage
persecution
of Vaish-
naviam.

ostensibly to perform a festival, and, as a punishment for their incompetency, degraded them to the status of *paiks*. These persecutions were continued by Gadadhar Singh, who in 1692 plundered the treasure houses of the Vaishnavite gosains, and cast the idols into the water. No respect was shown even to the sacred head of the Auniati *saltra*, and he was driven from his home to Tejikhat. He fared, however, better than the gosain of Dakhinpat, who had his eyes put out and his nose cut off, while many Hindu priests were put to death. A policy of extermination seems in fact to have been inaugurated, and, according to one chronicler, orders were issued for the destruction of every Hindu child regardless of sex and age. The king had large quantities of pork, beef, and fowls, cooked by men of the Dom caste, and compelled Kewats, Koches, Doms, and Haris to partake of this unholy food.

This policy of oppression was reversed during the reign of Rudra Singh, his son, who was publicly admitted as a disciple of the Auniati gosain; and, from this time forward, the influence of the priests seems to have increased.

The leading
gosains per-
secuted by
Moamaras.

During the Moamaria insurrection the religious orders again fell upon evil times. The rebel king confined the persons of the four principal gosains, and extorted Rs. 8,000 each from Auniati and Dakhinpat, and Rs. 4,000 each from Garamur and Kamalabari. Religion was degraded by the promulgation of an order that any person could be initiated on payment of a betel-nut, and the common people availed themselves in crowds of this

indulgence. Subsequently in the reign of Gaurinath Singh, the Moamarias attacked the Garamur *sattr*, burned it to the ground, slew a large number of the disciples, and nearly killed the gosain himself. His successor Kamaleswar Singh (1795—1809) found himself unable to pay the sepoy, whose services were indispensable for the maintenance of some sort of order in the kingdom. Following the example of other monarchs, he called upon the church to supply the funds for the support of the temporal power. Contributions were levied on all the mahunts, and the demands of the soldiers were satisfied.

But, though converted to Hinduism, the Ahoms **Laxity of Ahom Hinduism.** found the restrictions of their new religion irksome; and their gosains, with the tact which they display towards their converts of the present day, allowed their new disciples a considerable degree of latitude. Rudra Singh, though he had been publicly admitted to the church by the Auniati gosain, feasted his followers on buffaloes and pigs on the occasion of his father's funeral; while not only buffaloes but even cows found a place in the menu of his coronation banquet. At the time of the first Moamaria insurrection, the rebel chief made overtures to Lakshmi Singh, and offered him, apparently in good faith, a pig for supper. A present such as this, clearly shows that even towards the end of the eighteenth century, the Hinduism of the Ahom kings was one of the most liberal variants of that catholic creed. Before taking any decisive step, it was the practice to refer, not only to the Brahmans and Ganaks, but also to the old Ahom priests

the Deodhais and Bailongs. These venerable men were required to consult the omens, by studying the way in which a dying fowl crossed its legs; a system of divination which is in vogue amongst many of the hill tribes of Assam to the present day. The restrictions of caste were evidently somewhat lax, as we hear that the Moa-maria mahunt had an intrigue with a Hari woman; while at the beginning of the 19th century the viceroy of Gauhati took a fisher girl for his mistress, a breach of the convenances for which, it should be added, he was deposed.

**The position
of women.**

The influence of the Muhammadans in Assam Proper was so slight, that the low view they professed to take of the other sex had little or no effect upon the general population. The Ahoms, like their Burmese ancestors, held their womenfolk in honour, and even at the present day the purdah, and all that it implies, is almost unknown in the country inhabited by the Assamese. The Ahom princesses seem to have taken a prominent part on ceremonial occasions, and not unfrequently exercised considerable influence on affairs of state. In the middle of the 17th century, two of the queens almost usurped the reins of government, and, according to the Ahom chronicler, "their words were law." When called to account by the successor of their husband, they proudly stated that they had been of great service to the king at a time when he was ignorant of the way in which he should behave, whether when "eating, drinking, sitting, sleeping, or at council." Sib Singh (1714—1744) is said to have abdicated in favour of his

queens, hoping thereby to defeat a prophecy which declared that he would be deposed ; and coins have been found bearing the names of four of these princesses. The mother of Lakshmi Singh dug a tank, and Gaurinath entrusted to his stepmother the control of the Khangia mel, and consulted with his mother about affairs of state. It was not, however, only the princesses of royal blood who concerned themselves with public matters. At the time of the Moamaria insurrection, one Luki Rani was sent against the rebels ; and the victory over Turbuk in 1532 is partly ascribed to the courageous action of the widow of the Buragohain, who had been killed in a previous engagement by the Muhammadans. Desperate at the loss of her husband, she put on armour and rode into the ranks of the enemy to avenge his death. No mercy was shown her and she fell, pierced with spears ; but her example emboldened the Ahoms, who at once advanced to the attack and defeated the Musalmans with great slaughter.

In estimating the effects of British rule, it is necessary to form a clear idea of the state of the Province at the time when it passed into our possession, and first it must be pointed out that the British did not conquer Assam in the sense in which that word is usually employed. The native system of government had completely broken down, the valley was in the hands of cruel and barbarous foreigners, and it was not as conquerors but as protectors and avengers that the English came. They were certainly not inspired by any lust for land. For some time after the expulsion of the Burmese,

Condition of
Province at
time of
cession to
the British.

the East India Company were doubtful whether they would retain their latest acquisition, and an attempt was made to administer the upper portion of the valley through a descendant of the Ahom kings.

The condition in which we found the country was lamentable in the extreme. For fully fifty years the Province had been given over to desolation and anarchy. Life, property, honour were no longer safe, and the people in their misery had even abandoned the cultivation of the soil, on which they depended for their very livelihood. Bands of pirates used to raid up the valleys of the Dhansiri and Kakadanga, and return with their boats laden with booty, leaving ruin, death, and desolation in their wake. The hill tribes were no longer kept in order, and the Daflas descended and harried the submontane tracts, and even extended their depredations to the south of the Brahmaputra. The treatment meted out to the unfortunate villagers, can be judged from the protest made by the hillmen to Rajeswar Singh, shortly before the collapse of the Ahom government, when they begged him "not to pull out the bones from the mouths of dogs." Buchanan Hamilton, writing in 1809 A. D., states that north of the Brahmaputra "there is no form of justice. Each power sends a force which takes as much as possible from the cultivator."

Native testimony on this point.

The memories of this miserable time survived long after it had passed away. In 1853, an Assamese gentleman, Srijut Ananda Ram Dhekial Phukan, wrote as follows to Mr. Moffatt Mills: "Our countrymen hailed the day on which British supremacy was proclaimed in

the Province of Assam, and entertained sanguine expectations of peace and happiness from the rule of Britain. For several years antecedent to the annexation, the Province groaned under the oppression and lawless tyranny of the Burmese, whose barbarous and inhuman policy depopulated the country, and destroyed more than one half of the population, which had already been thinned by intestine commotions and repeated civil wars. We cannot but acknowledge, with feelings of gratitude, that the expectations which the Assamese had formed of the happy and beneficial results of the Government of England, have, in a great measure, been fulfilled; and the people of Assam have now acquired a degree of confidence in the safety of their lives and property which they never had the happiness of feeling for ages past."

Whatever errors have been committed by the British Government, and it is too much to hope that no mistakes of policy have been made during an administration of nearly eighty years, there can be no question that the introduction of a settled form of government has been of the greatest benefit to the immense mass of the people to whom it has been extended.

Reference has been already made to the hesitation with which the East India Company undertook the administration of Assam. In 1833, the experiment was tried of placing the portion of the valley lying between the Dhansiri and the Dihing south of the Brahmaputra, and between Bishnath and Sadiya on the north bank, under Raja Purandar Singh. The Raja was accorded the position of a protected prince, was entrusted with full

**Purandar
Singh's terri-
tory.**

civil powers, and was required to pay an annual tribute of Rs. 50,000 to Government. It was thought that this arrangement would prove acceptable to the Assamese, but experience showed that this was not the case. In 1838, Captain Jenkins, Agent to the Governor-General on the North-East Frontier, travelled through the Raja's territories, and was met on every side by complaints and charges against his administration. North of the Brahmanputra the country was left unprotected, and the people were harried by the Daflas, who carried off their women and children and held them to ransom. Small guards of sepoys were occasionally sent to protect the frontier, but, as the villagers were expected to provide them with all that they required, their presence and absence alike were felt to be a grievance. The distasteful system of compulsory labour was still maintained, duties of as much as one anna in the rupee were levied on everything except rice sold in the markets, and the people who remained were required to pay the poll tax of others who had died or had migrated to the territory directly under our administration.

There can be little doubt that Purandar Singh's administration was unpopular with every section of the community, but it is difficult to resist the conclusion that it was never really given a fair chance. Major White estimated that the revenue of his territories amounted to about Rs. 80,000.* Of this no less than half a lakh was ear-

* Letter No. 80, dated 6th July 1838, from Captain Jenkins. A letter from Purandar Singh's son states that when his father accepted the Raj he had no idea what a large proportion Rs. 50,000 bore to the total revenues of the country. Colonel Cooper, he says, had made a settlement for Rs. 1,70,000, but neither he nor any of the British officers who succeeded him could collect more than Rs. 70,000 or Rs. 80,000.

marked as tribute, and the Raja was left with a nominal Rs. 30,000 per annum from which to defray the expenses of his court, to satisfy the demands of the priests, and to carry on the business of the administration. It is hardly matter for surprise that little was spent on public works, that the army was small and inefficient, and that it was impossible to remit taxation. The natural tendency of mankind to cavil at the government seems to have been overlooked, and too much importance was attached to every murmur of complaint. The Muhammadan settlers in the country professed that they had serious grievances, yet Captain Jenkins was himself constrained to admit that those who came to see him were far better dressed than he expected, and that, judging by externals, many of them were well off. There can, however, be little doubt that the resumption of this territory in 1838 was an act which met with hearty approval from the great majority of the persons affected.

The history of the district since it came under British rule has been one of peaceful development. The great tea industry has had a wonderfully stimulating effect, and the progress of the people has not been retarded by the terrible outbreaks of malarial fever which decimated the population of Lower and Central Assam. The only other points that call for notice are the conduct of the local notables during the trying times of 1857, and the behaviour of the Naga tribes beyond our frontier.

At the time of the Mutiny the resumption of Sibsagar was a matter of comparatively recent date, and it was only natural that the family of the Raja and the upper

Peaceful
progress
under Bri-
tish rule.

Plots in 1857

classes and hangers-on of the former court should think regretfully of the times of Purandar Singh. Mr. Moffatt Mills, in 1853, admitted that they had been ruined by the emancipation of their slaves, and that this measure had reduced many families of respectability to indigence; and it was not to be expected that such people would be enthusiastic supporters of the Company. The miseries of the Burmese invasion were not yet forgotten, and they had no desire for actual independence; but they had every reason to deplore the abolition of the privileges of their caste, which they hoped to be able to restore in a protected native state. Even in 1853, the young Raja, Kandarpeswar Singh, urged on Mr. Mills his right to hold Upper Assam as an independent tributary; and it was only natural that, when four years later the flame of revolt spread over Hindustan, the more daring of his adherents should have planned to seize by force what had been denied to their more peaceful supplications.

**Moni Ram,
Dewan, chief
instigator
of the plot.**

The prime mover in the matter was Moni Ram, Dewan, who, in the time of Purandar Singh, was one of the most important persons in the district. On its resumption by the Company he lost his most valuable offices and emoluments, and resigned those that were left to him, to take service as Dewan of the Assam Company. He no longer found it an easy matter to support his household, which he informed Mr. Mills numbered no less than 185 persons, and he had every motive to induce him to promote the restoration of the old order, and sufficient hardihood and independence to attempt to give effect to his desires.

From Calcutta he wrote to the Saring Raja, Kandarpeswar Singh, informing him that Hindustan had been conquered by the sepoy, who were daily approaching nearer to the Presidency town, and advising him to take this opportunity of recovering the throne. Meetings were accordingly held at night at the Raja's house, and Duti Ram, the criminal sheristadar at Sibsagar, was approached, and lent his approval to the scheme. The subadar at Dibrugarh was also seduced from his allegiance, and promised to bring his men to support the Raja at Jorhat. A number of other influential men seem to have been gained over, and steps were taken to collect provisions for the soldiers.* The rising was to take place in the Durga Pujas, when, in the presence of Moni Ram Datta and other leading men amongst the Assamese, Kandarpeswar Singh was to be seated on the throne. This proposal did not, however, meet with general approval. The raiyats, when they learned of it, became alarmed, concealed their property, and prepared for flight; and some of the older men approached by the Raja not only declined to assist him in the furtherance of his plans but disclosed them to Harnath Parbottia Borua, the daroga of Jorhat.

The district officer, Captain Holroyd, seems to have been well informed of what was going on, and at the proper time the Raja was arrested and despatched to Alipur. At the conclusion of the enquiry he was released, but was required to live under surveillance in the neighbour-

Plot crushed
by Deputy
Commis-
sioner.

* Letter dated 28th June 1858, from Capt. Holroyd to Secretary to Government of Bengal.

hood of Calcutta, and was not allowed to return to his native country. Moni Ram was arrested at Calcutta, and sent up to Assam, where he was duly tried, sentenced, and hanged ; and the story of his death is often sung in the villages even at the present day. The sepoy at Dibrugarh seem to have been much affected by the mutiny of Koer Singh, from whose territory many of them came, and, for a time at any rate, succeeded in influencing the Assamese soldiers in the corps. This feeling of uneasiness was not noticed till September, when Colonel Hannay made carefully conducted enquiries with regard to the temper of his men, distributed the Hindustanis over the smaller and remoter outposts, from which they had no means of communicating with one another, and gradually concentrated the loyal nucleus of Nepalese at Dibrugarh.

The hands of the authorities were further strengthened by the despatch of two naval brigades, each consisting of 100 Europeans, who reached Assam in September 1857 and January 1858, and there was no overt outbreak to disturb the public peace.

**The Trans-
Dikho
Nagas.**

The hills east of the Dikho are inhabited by tribes of independent Nagas, but, even in the days of native rule, they were in political relations with the Ahom government. They have always derived considerable profit from their dealings with the plains, and they generally have sufficient sense to abstain from carrying their quarrels into British territory. In 1842, Captain Brodie, who was at that time in charge of the Sibsagar district, went for a tour amongst the Naga villages between the

Dikho and the Buri Dihing. He reported that in this tract there were the following ten clans :—

(1) The Namsangias with 8 villages; (2) the Bor-duarias with 8 villages; (3) the Paniduarias with 10 villages; (4) the Mutonias or Kulungs with 4 villages; (5) the Banferas with 4 villages; (6) the Jobokas with 4 villages; (7) the Changnois with 8 villages; (8) the Mooloongs with 5 villages; (9) the Jaktoongias with 8 villages; (10) the Tabloongias with 13 villages.

Captain Brodie persuaded the chiefs of these clans to abstain from outrages on British territory and to discourage inter-tribal feuds, and, so great are the advantages that they obtain from intercourse with the valley, that these sections of the Naga race have seldom been a source of serious trouble. In 1863, the outpost at Geleki was burnt down by a raiding party belonging, apparently, to some of the remoter Naga tribes. Government did not on this occasion close the duars to trade, but when in 1867 the post was again attacked, and several of the constables killed, the neighbouring tribes were promptly excluded from the plains. This measure resulted in the arrest of two of the principal offenders, who were found to be Zungia Abor Nagas, a clan whose villages were situated at a considerable distance from the valley.

In 1884-85, the Deputy Commissioner of the Naga Hills toured through the country lying on either side of the Dikho, and in the following year it was laid down that the hills west of that river should be under his management and not under the Deputy Commissioner of Sibsagar. The most important tribes with which the

**The Dikho
laid down as
frontier of
Naga Hills.**

latter officer is concerned are the Banferas and the Jobokas. The two clans have for many years been on bad terms with one another, but, so long as they respect the sanctity of our frontier, they are allowed to settle their disputes as best they can. The Sibsagar Nagas are generally fairly quiet, but from time to time they carry their feuds across the border or cause annoyance by their petty thefts. In 1891, they seem to have been unsettled by the Manipur disturbances. They became more insolent in their manner, the people living near the frontier were alarmed, and a detachment of 100 sepoy was stationed for nearly two months at Sibsagar. Small parties of men were sent to Sonari and Bihubar, and some military police were quartered at Geleki, and public confidence was thus restored.

**Murders in
1902.**

In the following year there was an epidemic of outrages upon the frontier. In April, a party of Banfera Nagas sallied out to kill the Raja of Lakrang, a small village which had formerly been subject to Banfera but which had been annexed by the Joboka Nagas. The Raja made his escape, but one of his followers was murdered in some jungle on the Balijan grant near the Inner Line.* The Banfera Raja was called upon to deliver up the culprit, and, as he only handed over a wretched individual who was innocent of the crime, he was fined Rs. 500 by the order of the Chief Commissioner. Barely half this fine was, however, realized and the balance was remitted. In November of that year two Nagas of Jak-

* A line laid down as the limits of the effective jurisdiction of the Assam administration, without prejudice to our claims to territory beyond it.

tung were killed near the Santak grant by Failung Nagas, who mistook them for men from Khongan, a village with which they were at feud. The murderers were sent in and sentenced by the Sessions Judge to transportation for life, but were pardoned by the Chief Commissioner on condition that the Failung and Jaktung villages composed their differences. In March 1893, a Banfera Naga who had settled in the Abhaipur mauza was murdered by the Lakrang Raja. The murderer was arrested by the police and committed to the Court of Sessions.

In 1892 and the following years, complaints were received from the General Manager of the Assam Tea Company of petty thefts committed by Nagas on the Dholbagan and Charaideo gardens. In February 1895, these petty annoyances culminated in the destruction by fire of a godown at Charaideo and of stores valued at about Rs 4,000. The chiefs of all the villages using the Tiru path were ordered to deliver up the culprits, or in alternative to pay a fine of Rs. 50 per village, and, as they failed to comply with these demands, the path was closed and a guard of 14 military policemen posted there to enforce the order. Three years later the guard was withdrawn as its retention was no longer considered to be necessary.

In July 1900, the Joboka chief Vangping and three of his relations were murdered, and twenty-five of his relatives and friends fled to British territory to avoid sharing his fate. They reached the Tingalibam garden, and were followed there by parties of armed Nagas, who demanded their surrender. This was refused as the refugees declared that their lives would be in danger, and in the evening

The Tiru
path closed.

Nagas visit

demand
surrender of
fugitives.

they were sent to the Sonari outpost for protection. The pursuing Nagas remained some time on the garden, but fortunately committed no overt acts of violence. A small fine was, however, imposed on them for coming armed into British territory.

**Archæological remains,
Tanks.**

The principal memorials of their rule left by the Ahoms in Sibsagar are the fine bunds, many of which are still used as roads, the temples, and the tanks. The total number of old tanks in the Sibsagar district is very large, but five stand out pre-eminent. The European station of Sibsagar has been built upon the banks of a tank of beautiful fresh water, which is about $1\frac{3}{4}$ miles in circumference, and is no less than 114 acres in area. About two miles south of Sibsagar is the Rudra Sagar tank, which has an area of 106 acres, and six miles west of Rudra Sagar is Gaurisagar (85 acres). These three tanks in themselves would satisfy the requirements of a dense population, but between Rudra Sagar and Gaurisagar there are two more great reservoirs, one north and one south of the road that runs to Gaurisagar. The northernmost is known as Athai Sagar and has an area of 103 acres, while immediately opposite is the Jay Sagar tank, area 118 acres. The fact that these great sheets of water are situated in such close proximity to one another is ample evidence that their designers were not actuated by any base utilitarian motives. These tanks are surrounded by moats from which earth was evidently taken for the embankment of the reservoir. The water level of the tank is thus higher than that of the encircling moat.

The temples are built of thin flat bricks baked till they **Temples.** have almost reached the consistency of earthenware. They are nearly all of them of one design, and consist of an egg-shaped dome enclosing the shrine approached by a short nave. The outer wall of the dome is often adorned with bas-reliefs. A list of the temples in the district will be found appended to the following chapter. The temples on the Sibsagar tank are naturally the best known.

The palace at Rangpur stands about a mile to the south of Sibsagar station. The following description is taken from the Report of the Archæological Survey, **The palace and Rang-ghar at Rangpur.** Bengal Circle, for the year 1902-03 :—

“ It is a building of irregular shape, consisting of a long flight of rooms running from east to west, with several smaller wings in its northern and southern side. The lower storey apparently served principally as stables, store-rooms, servants' quarters, etc., while the royal apartments were located in the upper storey, which has now disappeared for the greater part. In the central northern wing is an octagonal room, which is now called the *pujar ghor*. Close to it a portion of the royal apartments still exists. It has a stair leading up to the terrace, and the anteroom is covered by a vaulted roof. South of it stands an isolated room, believed to have been used by the queen during her confinement. Another isolated room in the south-western corner of the palace is believed to have been used as a kitchen. The area within which the palace stands is surrounded by a wall, which is approximately two miles in circumference. Another isolated building inside this area is said to have been used as a powder magazine. It is called Karghar.”

“The Rangghar stands outside the palace enclosure, to the west. It was the place from where the king used to watch buffalo-fights and other sports. Its erection is ascribed to Pramatta Sinha in the year 1744 A.D. It is the best preserved ruin of the ancient Ahom capital. Its shape is octagonal, but the northern and western sides are much longer than the other ones. Each of these

longer sides has three large and two small openings. The building has two storeys, each being divided internally into one large central room and two smaller ones at the eastern and western end. The position of the western chamber is occupied by the stairs leading to the upper storey, outside a gap is left in the staircase, sufficient to allow an elephant standing between it. A person mounted on an elephant thus could ascend the steps leading to the upper storey immediately from the back of his elephant, without dismounting first. The roof is crowned by three small turrets in its centre, and at its eastern and western end are the projecting heads of two small *makaras* or *jalbastis*."

Gargaon.

Of the ruins of Gargaon very little now remains. The palace was a three-storeyed building. The two lower storeys contained a single centre chamber with a verandah on each side, at each corner of which there was a small room. The top storey was nothing more than a cupola, the room being only five or six feet square. The building is at present in a very dilapidated state, but is possessed of some architectural merits.

Dimapur.

Some of the most interesting remains in the Sibsagar district are, however, in no way connected with the Ahoms. The old Kachari capital at Dimapur is situated in the midst of the huge Nambar forest, which stretches a pathless wilderness of trees for many miles on every side. Prior to the construction of the railway it was extremely inaccessible,* and the existence of the remains of what must evidently have been a considerable city in the middle of this howling jungle affords a striking instance of the rapidity with which nature in the East can obliterate the handiwork of man. The enclosure

* It was 55 miles by road from Golaghat, and almost the whole of the way the road ran through the densest and most malarious of forests.

wall of the capital at Dimapur is made of thin flat native bricks, and, according to Dr. Bloch, is about one and a half miles in circumference.* It is entered by a brick gateway which belongs to the Bengali style of Muhammadan architecture, and which was probably erected under the direction of some foreigner like Ghonsyam, the Bengali architect of the Ahom Rajas. Within there are several rows of curious pillars, some shaped like gigantic pawns and others in the form of a capital V. A little to the south of the gate there are four rows, two of pawns and two of V-shaped pillars, consisting alternately of 16 and 17 monoliths. They are massive pieces of sandstone, those in the centre being about 13 feet high and 14 feet in circumference, and are ornamented with rude carvings in low relief of flowers, geometrical figures, and animals. A little to the west of this group of pillars there is a single pawn, the largest yet discovered, which is $16\frac{1}{2}$ feet high and $23\frac{1}{2}$ feet in circumference. North of this pillar there is another double row of pawn pillars, while to the south are the remains of more pillars, all of which are lying shattered on the ground and half buried in the earth. Local tradition has it that these pillars were erected at the place where animals were sacrificed by the Raja, and tradition is to some extent confirmed by the customs of the Nagas at the present day. These hospitable hillmen keep a record of their feasts and erect a round topped post when they have killed a mithun and a V-shaped post when they have slain a cow ; and these curious monoliths may thus commemorate some

* Annual Report of the Archæological Surveyor, Bengal Circle, for 1902-03.

particularly gorgeous banquet of the Kachari king. On the top of the V-shaped pillars there are mortice holes, but it hardly seems probable that they can ever have supported the roof of any building. All traces of this building, if any such existed, have at any rate completely disappeared. That Dimapur was once the centre of a crowded population is shown by the existence of a large number of tanks in the immediate vicinity. It is said that there are altogether fifty-two, but most are buried in impenetrable jungle, and it is not easy to ascertain their actual number. Some of them are of considerable size, the tank on which the inspection bungalow is built measuring about 300 yards along the shorter sides.

Ruins at Kasomari Pathar.

In the forest near the Doiang, about one day's journey by boat from Jamaguri railway station, there are the remains of an old city. The earthen ramparts and moats are still visible, and seem to have extended for about half a mile each way. Within the ramparts are lines of pillars, and, in addition to the chessmen and V-shaped pillars of Dimapur, there are others of the shape of a sword or dagger. These ruins are described in the Report of the Archæological Survey, Bengal Circle, for the year 1904-05.

Miscellaneous.

In the Maloa Pathar a little to the west of Jorhat town there is a large tumulus known as the *barbheti*, which is said to have been the site of the *namghor* of the Moanaria gosain in the latter half of the seventeenth century. According to the Ahom chronicles, each disciple of the gosain brought one sod for the construction of this enormous mound, and this enabled him to ascertain their

number. Two smaller mounds near by are known as the *majar bheti* and the *majia bheti*, and were the sites of the houses of the gosain and his brother. Old Ahom cannon are common in the district, and there is one of really enormous size, which has been placed in position on the banks of the Sibsagar tank.

CHRONOLOGICAL TABLE.

AHOM KINGS.		MUHAMMADAN INVASIONS.	
A. D.		A. D.	
1228	Sukapha.	1204	Baktiar Khilji—Invades Assam.
1268	Sutenpha.	1220	Ghiyas-ud-din Bahadur Shah—Advances to Sadiya, but is defeated.
1281	Subinpha.	1256	Iktiyarud-din Yuzbak Tughril Khan—Invades the Brahmaputra Valley, but is ultimately defeated.
1293	Sukangpha.	1337	Muhammed Shah—Sends a force "of 100,000 horsemen" into Assam, all of whom perish.
1332	Sukampha.		
1364	Sutupha—Treacherously killed by Chutiyas at a regatta held on the Saffrai river to celebrate a cessation of hostilities between the two tribes.		
1376-1380	Interregnum.		
1380	Sukemthi—A weak and tyrannical prince, assassinated by his ministers.		
1389-1398	Interregnum.		
1398	Sudangpha.		
1407	Siyangpha.		
1422	Suphukpha.		
1439	Susingpha—Defeats Nagas.		
1488	Suhangpha—defeated by Kacharis in 1490, and murdered by a convict.		
1493	Supimpha—A cruel prince, assassinated by his ministers.		
1497	Suhunmung, <i>alias</i> Sarga Narayan or Dihingia Raja—Conquers Chutiyas and annexes their kingdom in 1523. Repulses two Muhammadan invasions, the second being that under Turbuk in 1532, who was routed near the Bharell river. Kills Kachari king and sacks Dimapur, his capital, in 1536. Assassinated 1539.		
1539	Sukhenmung—Built Gargaon (Nazira).	1509-1534	Viswa Singh—Founds Koch kingdom, advances against Ahoms but was apparently defeated.
1552	Sukampha.	1534-1584	Nar Narayan—Conquers Ahoms and occupies Gargaon, circa 1563 A. D. Subduces Raja of Cachar, Jaintia, Manipur, Tippera and Sylhet. Kala Pahar invades Assam in 1563 and destroys temples at Kamakhya and Hajo.
1611	Suchengpha or Pratap Singh—Assists Bali Narayan against Musalmans, besieges Hajo, but is driven back. Bar Nadi accepted as frontier between Muhammadans and Ahoms in 1637.	1581-1593	Raghu Rai—Obtains share of Koch kingdom east of Sankosh.
1649	Surumpha—Deposed.	1593-1614	Parikshit—Builds North Gauhati, quarrels with his cousin Lakshmi Narayan, calls in Muhammadans to his aid.
1652	Suchingpha—Deposed.	1614-1637	Bali Narayan—Invokes aid of Ahoms against Muhammadans. From this date the Koch kings cease to be of any political importance.

CHRONOLOGICAL TABLE—(continued).**AHOM KINGS.**

A. D.	
1654	Sutumla or Jaiyadwaj Singh—Ahoms occupy Goalpara 1658. Driven back by Mir Jumla, who enters Gargaon, 1661.
1663	Chakradwaj—Ahoms re-occupy Gauhati in 1667.
1670	Adayaditya Singh—Assassinated.
1672	Suktumpha—Poisoned. Musalmans re-occupy Gauhati.
1674	Suhung—Assassinated.
1674	Teunkungiya—Assassinated.
1674	Suhungpha—Blinded and murdered.
1677	Sudinpha—Assassinated.
1679	Sulekpha (Lora Raja)—Assassinated.
1681	Gadadhar Singh—Ahoms recover possession of Gauhati.
1695	Hudra Singh—Founds Rangpur, defeats Kachari and Jaintia Rajas, publicly adopts Hinduism as his religion. This period represents the height of the Ahom power. Dies at Gauhati.
1714	Sib Singh—A weak prince, who resigned in favour of his wives. Excavated tank at Sibsagar.
1744	Pramatta Singh.
1751	Rajeswar Singh—Decline of Ahom power.
1769	Lakshmi Singh—Outbreak of Moamaria rebellion—king deposed for a time, but subsequently reinstated.
1780	Gaurinath Singh—Driven to Gauhati by Moamaras. Reinstated by Captain Welsh in 1792, who is, however, recalled in 1794. Krishna Narayan, Darrang Raja, asserts his independence in 1792, but is defeated by Captain Welsh.
1795	Kamaleswar Singh—Deposes Krishna Narayan.
1809	Chandra Kanta Singh—Burmese are invited into Assam by Bor Phukan. Deposed 1816.
1816	Purandar Singh—Burmese again enter Assam. Deposed 1818.

CHRONOLOGICAL TABLE—(concluded).**AHOM KINGS.**

A. D.	
1818	Chandra Kanta Singh—Burmese decline to leave. Chandra Kanta driven from Assam in 1820.
1824	War declared between British and Burmese Governments.
1825	Rangpur taken.
1826	Treaty of Yandaboo, by which Assam was ceded to the East India Company.

CHAPTER III. THE PEOPLE.

Area and density—Towns and villages—Growth of population—Migration—Sex and marriage—Infirmities—Language—Caste and tribe—Religion—Saktism—Sivaitism—Vaishnavism—The Sattras of Sibsagar—Muhammadans—Animism—Other religions—Christians—Occupations—Marriage customs—Amusements and festivals—List of sattras.

The district covers an area of 4,996 square miles, and in 1901 had a density of 120 to the square mile or 33 less than that reported from Kamrup. It must not, however, be supposed from this that Sibsagar is sparsely peopled. West of the Dhansiri there is very little population, but a dense population would be an impossibility in the Mikir Hills. Equally difficult would it be to settle many persons in the flooded tracts that fringe the Brahmaputra, but south of this flooded area and east of the Dhansiri there is no lack of inhabitants. In Golaghat there are considerable areas with a population of over 300 to the square mile. In the Jorhat tahsil there was, in 1901, a density of 441, while two mauzas near the town had a density of no less than 621. In Sibsagar, too, the area covered by the Sibsagar and Namtidol tahsils and the Hachara and Joktali mauzas, 344 square miles in all, had a density of 341. Even in the more densely settled tracts Sibsagar is in no way overpeopled, but the pressure on the soil is much more severe than the figure

Area and
density.

of density for the district would at first suggest. Table III shows the population and density in each minor unit in 1901.

Towns and villages.

Sibsagar contains three small towns, Sibsagar (population 1901, 5,712), Jorhat (population 1901, 2,899), and Golaghat (population 1901, 2,359) and 2,109 villages. The villages are not, however, well defined units, clusters of huts which stand out clearly in the centre of the fields tilled by their inhabitants. Rice, the staple crop, is grown in wide plains, dotted over with clumps of bamboos and fruit trees in which are buried the houses of the cultivators. It is groves and not villages that the traveller sees when riding through the more densely populated portions of the district, and not a house can usually be seen till he has penetrated this jungle of plantains, betel-nut trees, and bamboos. There is generally no dearth of building sites, there are no communal lands, and there is nothing to keep the population together. It is difficult to tell where one village ends and another begins, or to which of the larger clumps of trees should be assigned the smaller clumps which are freely dotted about amongst the rice fields. The result is that the statistics of villages are of little practical importance, but, taking them for what they are worth, it appears that villages run small, and in 1901 about half the population were living in hamlets with less than 500 inhabitants.

Growth of population.

In 1841, Mr. Robinson estimated that the population of Sibpur, which was bounded on the west by the Dhansiri and on the north by the Brahmaputra and thus

excluded the Mikir Hills and the Majuli, was 200,000 souls.* A census of the district including the Majuli taken in 1844 showed a population of 159,573 persons; but this census was probably more inaccurate than the Deputy Commissioner imagined, and even he was of opinion that the population was about 180,000.† In 1872, the first census of the whole of the Province was taken, and though it was non-synchronous it was probably more accurate than any of its predecessors. The abstract in the margin shows what a large and steady increase has

	Population.	Percentage variation.	taken place at each of the three last enumerations. A great part of this increase is due to the coolies who have been imported in large num-
1872	317,799		
1881	392,545	+23.5	
1891	480,659	+22.4	
1901	597,969	+24.4	

bers to work on the tea gardens situated in the district; but it is satisfactory to know that, in contradistinction to Lower and Central Assam, there has been a substantial natural growth of population. Natural growth is perhaps best measured by the increase in the number of those born and censused in the district, and this amounted to nearly 13 per cent between 1881 and 1891, and to nearly 17 per cent in the next decade. Many of these so-called natives are the children of foreign mothers, but the caste table shows that between 1891 and 1901 indigenous castes and tribes, who might fairly be classified as "Assamese," increased by $8\frac{1}{2}$ per cent.

* Robinson's Descriptive Account of Assam -- Calcutta, 1841, p. 317.

† Report on Assam by A. J. Moffatt Mills -- Calcutta, 1854. Sibsagar, p. 2.

Increase by subdivisions.

The statement in the margin shows that during the last decade the increase has been especially pronounced in the Sibsagar subdivision. This, no doubt, is largely due to the fact that during this period there has been a large increase in the area under tea, which necessitates a corresponding increase in the labour force. Further there is more waste land available for settlement in Sibsagar than in Jorhat, where the population is already fairly dense, and this is a fact which naturally largely influences settlers when they leave the gardens.

Subdivision.	Population 1901.	Percentage of increase.	
		1891-1901	1881-1891
Sibsagar	211,809	+ 32.1	+ 24.1
Jorhat	119,137	+ 20.9	+ 23.1
Golaghat	167,023	+ 19.9	+ 23.3

Migration.

In 1901, 151,612 persons, or just a little over one fourth of the total population had been born outside the frontiers of Assam. About one half of these people came from the Chota Nagpur division of Bengal, which supplies Assam with the healthiest but most costly of her labourers, while one-quarter came from other places in that Province. Upwards of 18,000 persons came from the Central Provinces; nearly 9,000 from the United Provinces of Agra and Oudh; and over 4,000 from Madras. The great bulk of these persons had been imported to the tea gardens as coolies. There were a few artizans and carpenters from China and the Punjab, and a few natives of Bombay, who were either employed on the railway or interested in the liquor trade. The natives of Afghanistan are the Kabulis or pedlars who travel all over the Province in the cold

weather. The Nepalese are for the most part graziers who keep large herds of buffalo on the marshes near the Brahmaputra, and the natives of Rajputana are the shrewd Marwari merchants who have succeeded in monopolising practically the whole of the trade of the Assam Valley. As far as inter-district migration is concerned, Sibsagar sends settlers to the waste lands of Lakhimpur and Darrang, and receives labourers from Kamrup and Goalpara. Statistics of birthplace by sub-divisions will be found in Table V.

The proportion of women in Sibsagar has always been unusually low. In 1872, there were only 919 women to every thousand men, and since that date the ratio has declined till, in 1901, there were only 886. This disproportion between the sexes is partly due to immigration, but the effects of immigration can be discounted by working out the ratio on those born in the district and censused in the Province. Women, however, still remain in a pronounced minority, and in 1901 there were only 925 to every thousand males. This ratio is lower than that returned from any other district in Assam, and differs in the most marked degree from that recorded in the neighbouring district of Nowgong, where it was as high as 1,016. The causes which determine the proportion of the sexes are most obscure, but generally speaking there seems to be a tendency for the number of women to increase where public health is bad and vitality low. This would serve to account for the strength of the female element in the population of Now-

Sex and
marriage.

gong, but leaves the scarcity of women in Sibsagar unexplained. Unskilful midwifery and the debilitating effects of excessive child bearing probably tend to shorten the lives of the mothers of the race.

It is satisfactory, at any rate, to know that the deficiency of women is not due to the prevalence of early marriage. The figures in the margin show the percentage of Hindu girls under 10 and between 10 and 15, who have performed the marriage ceremony; and the proportion between 15 and 20, who even according to Western ideas would be considered *aptae viro*, who are still unwed. For the purposes of comparison, the figures for Goalpara have been included, as unfortunately in that district the idea has gradually gained ground that social advancement can in some way be obtained by subjecting an immature child to the responsibilities of matrimony. For every child wife or widow under 10 in Sibsagar, there are 8 in Goalpara; and between 10 and 15 the proportion in the two districts is as 1 to 6. The proportion of potential mothers, *i. e.*, married women between 15 and 40 is obviously a factor which materially affects the growth of the people. In this respect Sibsagar is somewhat at a disadvantage as they only form 158 per mille of the total population; and, though this is one above the average for the Province as a whole, it is much below

Percentage of Hindu girls married and widowe l.

	Age. 0—10	Age. 10—15
Sibsagar	0·6	10·9
Goalpara	4·8	62·4

Percentage of Hindu girls unmarried.

	Age. 15—20
Sibsagar	47·7
Goalpara	7·2

the figure for the Central Provinces which in 1901 was 169.

From the statement in the margin it will be seen **Infirmities** that Sibsagar is fairly free from three out of the four special infirmities selected for record at the census. The proportion of lunatics, though higher than that for the Indian Empire as a whole, is lower than the average for the Province, while the proportion of deaf-mutes is below, and that of the blind largely below the provincial average. The number of lepers is, however, considerable, and the ratio of those afflicted with this dire disease in 1901 was nearly three times as high as that recorded for the Indian Empire as a whole. In this respect Sibsagar is in no way peculiar, as, for reasons which have hitherto completely baffled medical science, leprosy has always been extremely prevalent in Assam.

Fifty-nine per cent of the people in 1901 returned **Language.** Assamese as their customary form of speech, 4 per cent Mikir, and 2 per cent Miri, two other languages indigenous to the Province. Bengali was returned by 19 per cent of the people, but it is doubtful whether to an Assamese enumerator Bengali means anything more than a foreign language, and this term probably included many forms of speech which would have been hardly intelligible at Nadia. Six and a half per cent of the people reported that they spoke Hindustani. Assamese is described by

Number in 10,000 males afflicted in 1901.			
	Sibsagar.	Assam.	India.

Mr. Grierson as the sister not the daughter of Bengali.* It comes from Bihar through Northern Bengal and not from Bengal Proper. The plural and the feminine gender are formed in a different way from that in use in Bengali, and there is a considerable difference in the conjugation of the verb, in the idiom, the syntax, and even in the vocabulary. The pronunciation is also different, the Bengali sh being converted into h by the Assamese and ch into s.

**Caste and
Tribe.**

The caste distribution of Sibsagar is such as a perusal of the history of the district would lead one to expect. Brahmans are fairly numerous, as is only natural in the neighbourhood of the Raja's court. Kayasthas have been attracted to the district, partly in hope of employment under the Ahom kings, partly to work on the gardens which provide employment for a large number of the clerkly caste. Other respectable castes such as the Kalita, the Kewat, and the Koch, are fairly numerous, especially in Jorhat. The principal caste is, however, the Ahoms, who are especially numerous in the Sibsagar subdivision. Outside tea gardens and the camps of railway coolies, very nearly every second person in this subdivision in 1901 was a member of this caste. The number in Jorhat, though considerable, was nothing like so large, and Golaghat contained barely one-sixth of the number found in Sibsagar. The Chutiyas are also strongly represented, and most of them are found in Jorhat, as are also the Nadiyals or fishing folk. The tea industry

* Report on the Census of India, 1901, Vol. I, p. 324.

is of great importance, and the European population of the district in 1901 was no less than 356. The cooly castes most strongly represented were the Santals, Mundas, and Bhuiyas ; but it is hardly necessary to particularize further as details for all the more important castes will be found in Table V. The following pages contain a brief account of the indigenous castes and tribes which had more than 5,000 representatives in the district in 1901. An alphabetical glossary of all the castes censused in Assam will be found in Chapter XI of the Report on the Census of that year.

The Ahoms are the descendants of the Shan tribe ^{Ahom.}

Males	...	56,900
Females	...	54,219

who entered Assam in the thirteenth century, and gradually extended their sway over the whole of the Brahmaputra Valley. They are divided into three sections, the Chamuas or gentry, the Kheluas or functional sections, and the Meluas or servants of the royal family. These sections are not endogamous, though there is a natural tendency for men to take wives from families in their own rank of life, and inter-marriage between certain families such as the Handikoi and the Pakimara is prohibited, for reasons which are not very clear. The Ahoms still possess a sturdier physique than the ordinary Assamese, and the Muhammadan chronicler of Mir Jumla's invasion describes them as "strong, quarrelsome, and bold." The complexion is fair, the cheek bones high, and the face unusually broad. Practically all the Ahoms are now, in name at any rate,

Hindus, but their new religion sits lightly on them, and the lower orders still bury their dead. As amongst the other humbler Assamese castes, cohabitation often takes place after a feast has been given to the villagers and there is nothing in the nature of a religious ceremony. The more respectable form is the *chaklong*, which consists in the interchange of the *temi* and *katari*, the box in which betel-nut is carried and the knife with which it is cut ; the tying of the nuptial knot and a feast to the friends and relations. A hole is then cut in the corner of the house through which the bride is removed. A woman once married by the *chaklong* ceremony cannot be re-married by the same rite, though she can take a second husband by the simpler form of marriage which is known as *gur pithaguri*. Divorce is recognized, and the parties can marry again. Agriculture is the staple occupation of the caste. Their social position is a somewhat peculiar one. The fact that, prior to our occupation of the country, they were the ruling race obtains for them a considerable measure of respect, but the recency of their conversion to Hinduism necessitates a very low place in the Brahmanical order, and Brahmans will not, as a rule, take water from their hands.

Borias.

The Borias are a caste peculiar to Assam, which is formed from the offspring of Brahman and Ganak widows and their descendants. Boria is said to be derived from "bari", a widow, but the people prefer to call themselves Sut. This term is said by some to be

Males	...	2,747
Females	...	2,601

connected with the word Sudra, and by others to be derived from Sut, the expounder of the Puranas, who was himself the son of a Brahman widow. But the most plausible explanation seems to be that it is an abbreviation of Suta, the name given in the Shastras to the offspring of a Brahman woman by a Vaisya or Kshattriya father. One authority defines a Boria as the child of a Brahman widow, and a Sut as the result of union between a Sudra widow and a Brahman; but it is doubtful whether this explanation is correct, as in the latter case the child would presumably be of the same caste as its mother. The children of Brahman girls, who have attained puberty before marriage and so have to be married to men of a lower caste, are also classed with Borias. Agriculture is the ordinary occupation of the Borias, and their manners and customs do not differ materially from those of other low caste Assamese.

There are more Brahmans in Sibsagar than in any other district of Assam except **Brahmans.**

Males	...	8,090
Females	...	6,348

Kamrup and Sylhet; but this is only natural as priests are generally found in close propinquity to a native court. The Brahmans of Sibsagar are supposed to have originally come from Upper India, Mithila, Orissa, Benares, and Kanouj, and have little in common with the Brahmans of Bengal. The great majority are natives of Assam, but there are a few Bengali Brahmans, who in social questions keep themselves quite distinct from their Assamese *confrères*. The great centres of the Brahman population are Dergaon, the neighbourhood of Jorhat, and

the Majuli. Most of the Assamese Brahmans obtain their living from agriculture, though they are not of course allowed to plough with their own hands. Foreign Brahmans are generally employed in some ministerial capacity.

The Chutiyas, like the Koch and the Ahoms, are one of the race castes of Assam. Their physical appearance suggest a Mongolian origin, their language, which is still preserved amongst the Deoris or priestly clan, belongs to the Bodo family, and it seems probable that they are a section of the great Bodo race which includes the Garo, the Kachari, and the Tippera. It is supposed that their original home was in the hills through which the Subansiri makes its way, and that they entered the Assam Valley about a thousand years ago. The story of the decline and fall of the Chutiya power has already been told in the preceding chapter. Their conquerors wisely deported the leading families to different parts of the Assam Valley, but the great mass of the Chutiyas are still to be found in Sibsagar and Lakhimpur. The caste is divided into four subdivisions, Hindu, Ahom, Deori, and Borahi. The latter, as their name implies, are still unconverted and eat pork, but the number of Borahi Chutiyas is very small.

**The Deori
Chutiyas.**

The Deori Chutiya are the old priestly caste, and are described as follows in the Census Report of 1901 :—

“ Their original home was on the banks of the Kundil river east of Sadiya, but when the Ahom power began to decline, they were harried by the hill tribes in the neighbourhood, and at the

beginning of the century they migrated to North Lakhimpur, and from there moved to the Majuli, the Dikrang river, Sissi Mukh, and the Baligao mauza in Jorhat. The Mongolian type is much more strongly marked in them than in the ordinary Chutiya, and they might easily be mistaken for Miris. They keep pigs and fowls, but their most distinguishing characteristic is the enormous size of the houses in which they dwell. These houses are built on *changs*, and are enlarged from time to time to make room for the increasing size of the family. There are frequently as many as sixty persons living in one long barrack, and the Chutiyas themselves say that there are sometimes double this number living under one roof. The Deori Chutiyas on the Majuli profess to be Hindus, but beef is the only article of food from which they abstain, and it is said that all that they could remember of the instructions of their Gosain was that they were to pray to God, and keep their instructions secret; and it was possibly with the idea of avoiding any risk of indiscretion that they had so carefully forgotten all that they had been told. Their temples are copies in wood and thatch of the famous copper temple at Sadiya, which was at one time a centre of worship for all the hill tribes on the north-east frontier, but has long been in ruins. These models are small buildings about eight feet square, raised on high bamboos, and not unlike pigeon houses in appearance, standing in enclosures, into which no one but the temple officials are allowed to enter. In the principal village on the Majuli, a copper roof is being placed on the model to render the resemblance more complete. Mr. Brown, who was at one time Assistant Commissioner in North Lakhimpur, reports that the Deoris attach great importance to their own religion, but that a knowledge of its mysteries is apparently confined to the priests and the older men. There are four priests attached to each khel, the Bar and Saru Deori and the Bar and Saru Bharali. The two Deoris alone are entitled to enter the temple, and the Bharalis, as their name implies, are mainly concerned with the temporalities of the goddess.

The chief gods are three Gerasi Geri (Assamese 'Bura-buri') worshipped by the Debongia khel; Pishadema (Assamese 'Boliya hemata'), the elder son, worshipped by the Tengapaniya khel; and Peshasi (the daughter), who is also known as Tam-eshari Mai (the mother of the copper temple), and Kechakhati (the eater of raw flesh). The latter name is given in memory of the annual human sacrifice which in former times used to be

offered to the goddess, the victim being provided by the Ahom Raja. This abomination was discontinued during the reign of Gaurinath Singh, and, according to the Deoris, the downfall of the Ahoms was largely due to the neglect of this religious rite.

The human
sacrifices
at the
copper
temple.

The following interesting account of the human sacrifices offered near Sadiya is extracted from a note left by Lieutenant Dalton in the library of the Nowgong office :—

“ The chief and oldest of the shrines was the Tamar Ghar, or copper temple, which still exists in ruins and was lately visited by Captain Vetch. It is described as a small stone building nearly square, built without cement, the stones joined by iron pins not clamped. The roof was of copper, but it has fallen in, and now lies there. The interior is eight feet square. The whole is enclosed within a brick wall 130 feet by 200. Near the grand entrance in the western wall is a small stone tripod. Here human sacrifices were yearly offered till a very recent date, but latterly the Ahom kings gave for the purpose malefactors who had been sentenced to capital punishment. Suitable victims of this description were not, however, always to be obtained, and then a particular *khel* or tribe of the king's subjects was bound to provide one, for which they had certain privileges and immunities accorded them, such as being exempted from the payment of ferry and market duties; and were thence called *Sarh*, or free. For it was necessary that, the victims to be immolated, should be of pure caste and perfect form; the slightest blemish or mutilation, even the boring of an ear, rendering them unfit to be offered to the Gosaini, or goddess. Brahmans and members of the royal family were exempted as a privilege; Doms, Haris, Musalmans and women were excluded as unfit. For some time preceding the sacrifice the victim to be immolated was detained at the temple, where he fared sumptuously, till in sufficiently plump condition to suit the supposed taste of the Gosaini. On the day appointed he was led forth magnificently attired and decorated with gold and silver ornaments to be shown to the multitude that assembled on the occasion; then withdrawn and led by a private path trodden only by the officiating priests and their victim to the brink of a deep pit, where he was divested of his fineries and decapitated, so that the body fell into the pit. The head was added to a heap of ghastly skulls that were piled in view of the shrine. These sacrifices appear to have continued till the subversion of the

Ahom Government by the Burmese, when the Deoris abandoned their ancient possessions in the vicinity of the copper temple, to the fearful rites of which they had for upwards of six centuries administered, with the slaughter by their own account of some six hundred human victims."

The Ahom Chutiyas have for some generations been converts to Hinduism, but in the social scale they rank below the Hindu Chutiya, and their presence in a house is said to debar a Brahman from drinking water there. The Ahoms and Hindu Chutiyas can smoke but cannot eat together, and, in theory, cannot inter-marry. A member of the Ahom section can, however, obtain a Hindu Chutiya girl if he is willing to pay a slightly higher price for her, but the bride sinks to the status of her husband.

Hindu Chutiyas are sometimes united by the *hompura* ceremony, while the *chaklong* rite, which is the Ahom form of marriage, is in vogue amongst the Ahom Chutiyas. The Chutiyas are, however, far from strict in their views on matrimonial matters, and one native gentleman reports that 50 per cent of the so-called married couples have performed no ceremony at all, and that a girl sometimes changes her husband nine or ten times. The social position of the caste is low, and almost all of them are petty cultivators. They burn their dead and perform the *sradh* ceremony at the expiry of a month. Brahmans of inferior social standing act as their priests.

The Jugis are a low caste whose traditional occupation is weaving. In Sibsagar, under native rule, the Jugis were entrusted with the task

Males	...	...	3,424
Females	...	...	2,867

of rearing the *pat* silk worms, while the Katanis, a subdivision of the caste, spun the thread. They have now largely taken to agriculture, and silkworm rearing is only practised as a subsidiary occupation. Like other humble castes they lay claim to a high origin. According to one account they are the offspring of Brahman widows and ascetics or jogis, while others assert that they are descended from Gorakshanath, who was an incarnation of Siva. In Sibsagar, the name Jugi is derived from *joga* to supply, because they fed the worms while the Katanis spun the thread. Others connect it with *jugieri*, the name of a creeper whose leaves are eaten by the *pat* worm. The Jugis are endeavouring to improve their social position by celebrating the *hompura* rite, when their circumstances admit of such expenditure, and by burning instead of burying their dead; but good class Brahmans still decline to serve as their priests.

Kacharis.

An account of the origin of the Kacharis has already been given in the preceding chapter, and of the difference that exists between the Dimasa and the Bodo.

Males	...	..	10,036
Females	...	...	6,582

In Lower Assam, Kacharis, when they are converted to Hinduism, are generally incorporated into the ranks of the Koch caste, and the number of Hindu Kacharis is comparatively small. In Sibsagar this is not the case. The great majority of the caste have been converted to Hinduism, and most of them have foresworn pigs, fowls

and liquor, and live much as do the other humble Hindu castes. They do not as a rule attempt to change their names, though, of recent years, some have taken to calling themselves Ahoms or Chutiyas or occasionally Koch, and there is one family of Kachari priests who actually style themselves Kayastha. The broad distinction which in Lower Assam exists between the Kachari and the ordinary lower caste Assamese is hardly to be found in Sibsagar, and the tribe has lost its special tribal characteristics.

The following description **Kalita.**

Males	...	19,790
Females	...	16,837

of the Kalitas is reproduced from the Report on the Census of 1901:—

“There is much uncertainty as to the origin of this caste. The popular explanation is, that Kalitas are Kshatriyas, who, fleeing from the wrath of Parasu Ram, concealed their caste and their persons in the jungles of Assam, and were thus called Kul-lupta. Other theories are that they are Kayasthas degraded for having taken to cultivation, an explanation which in itself seems somewhat improbable, and is not supported, as far as I am aware, by any evidence; or that they are the old priestly caste of the Bodo tribe. The latter theory can hardly be said to account for their origin, and though it is possible that Kalitas may have originally acted as priests, this fact throws little or no light on the problem of what the Kalitas are. The most plausible suggestion is that they are the remains of an Aryan colony, who settled in Assam, at a time when the functional castes were still unknown in Bengal, and that the word ‘Kalita’ was originally applied to all Aryans who were not Brahmans.

“The Kalitas are divided into two main subdivisions, Bar and Saru, and into a number of professional subcastes. In Upper Assam, Bar Kalitas are said to decline to use the plough, though they occasionally work with the spade, but there is no such restriction in Kamrup, where the great bulk of the caste is found.

Cultivation is, in fact, the traditional occupation of the caste, and they even consent to work as coolies on tea gardens. The usual procedure for a Kalita who has succeeded in rising above the necessity for manual labour, and is no longer compelled to follow the plough, is to call himself a Kaist or Kayastha. Two explanations are given of the origin of the Saru Kalita—one, that he is the offspring of persons who for three generations back have not been united by the '*hom*' ceremony, the other that he is the child of a Bar Kalita and a Kewat woman. Whether the Bar Kalita can inter-marry with, and eat *kachchi* with, the Saru Kalita seems open to question, and the practice apparently varies in different districts; but there seems to be no doubt that the functional subdivisions of the caste are debarred from the privilege of close intercourse with the Bar Kalita. These subdivisions are the Mali, Sonari, Kamar, Kumhar, Napit, Nat, Suri and Dhoba. The first two inter-marry with the Saru Kalita, and also with the Kamar Kalita. The last four groups are endogamous. All these functional groups are to some extent looked down upon, probably because followers of these professions, who were not true Kalitas, have occasionally succeeded in obtaining admission within their rank; but the goldsmiths, from their wealth, have secured a good position in society. Kalitas have a good Brahman for their priest, and their water is taken by every caste, a fact which no doubt explains the high value attached to Kalita slaves in the time of the Assam Rajas, when two Koches could be purchased for the price of a single Kalita, though the Koch is generally the hardier and stronger man of the two."

Early marriage is common in Goalpara, but not in Assam Proper, except amongst the upper sections of the caste. They take, in fact, a liberal view of the relations between the sexes, and cohabitation is the essential part of marriage. Well-to-do Kalitas are invariably united by the *hompura* rite and employ a Brahman. The poorer people often content themselves with the *agchauldia* or *juron* ceremonies, which consist of a feast to the villagers and a public acknowledgment of the position of the bride. Some authorities hold that this, though a valid form of marriage for the lower Assamese castes, is

not sufficient for the Kalita. They regard the *hompura* rite as the one essential ceremony of purification. But it can be performed after cohabitation has begun, and sometimes takes place after the death of the husband. An unmarried girl who becomes pregnant, does not forfeit her position in the society, unless her lover is of lower caste.

Many of the Kayasthas are foreigners, and most of **Kayasthas.** them earn their living as clerks or officers in the employ of Government or of the Managers of different tea gardens. Kalitas who have risen above the necessity for manual labour frequently describe themselves as Kayasthas.

The Kewats are a respectable Hindu caste, from whose **Kewats.** hands Brahmans will take water, and who, according to Assamese ideas, rank immediately after the Kalita. These remarks only hold good, however, of the Halwa or cultivating Kewats, as the Jaliya, or fishing subdivision of the caste, occupy a very humble position in the social scale, and are considered little better than Nadiyals. The two sections of the caste have nothing whatever in common except the name Kewat or Kai-bartta, but the number of Jaliya Kewats is comparatively small. The ordinary occupation of the caste is agriculture, but a few of them have succeeded in reaching that desirable position in which the pen takes the place of the ploughshare as a means of livelihood. A respectable Brahman acts as their priest.

Mikirs.

According to Colonel Dalton, the Mikirs were originally settled in the North Cachar

Males	...	...	11,687
Females	...	...	11,224

Hills, but were driven westward into Jaintia territory

by the Kacharis. Dissatisfied with the reception accorded to them there they sent an embassy to the Ahom governor at Raha, offering to place themselves under the protection of his master : but, as the luckless delegates were unable to make themselves understood, they were forthwith buried alive in a tank which that officer happened to be excavating. Hostilities ensued, but the Mikirs were soon suppressed, and were settled in the hills that bear their name, though a considerable colony is still to be found in South Kamrup and the northern slopes of the Khasi Hills. They are divided into four tribes, Chintong, Ronghang, Amri, and Dumrali ; and these tribes are again subdivided into various exogamous groups. In the hills the Mikirs live by *jhum* or shifting cultivation and raise crops of cotton, chillies, rice, and vegetables. All the members of a family live in one house which is thus of considerable size. Their religion is of the usual animistic type, and is chiefly concerned with the propitiation of evil spirits. Infant marriage is unknown and sexual license within the tribe prior to marriage is tolerated. From Table V it will be seen that Mikirs are only found in the Golaghat subdivision. For further information with regard to this tribe, reference should be made to the Monograph by Sir Charles Lyall, K.C.S.I., which is now under preparation.

The Miris, or as they style themselves, Mishing, were **Miris.** originally settled in the hills to the north of the Lakhimpur district, between the Daffa and the Abor territory. They are thought to be members of the Thibeto-Burman family, and, if this is so, are akin to the Bodo or Kacharis, Garos, Rabhas, Meches and other cognate tribes. Their countenances are of a distinctly Mongolian type, but their appearance is by no means unpleasing. They are strongly built, with finely developed limbs, and their complexions often have a distinctly ruddy hue. They are cleaner in their persons than many of the Thibeto-Burman tribes, and fully appreciate the advantages of the bath. The Miris are divided into two main endogamous septs, the Barogams and the Dohgams, which are again subdivided into a large number of minor groups. In the plains they always live near running water. Their dwellings are built on piles, and are sometimes as much as 40 yards in length and contain from twenty to thirty inmates. Pigs and fowls scratch about beneath the houses, which are usually built in two long rows, and differ from those of the Assamese in having no fruit trees or gardens round them. The Miris support themselves by agriculture, and raise crops of summer rice, mustard, millet, pulse, and sweet potatoes. Though nearly half the Miris of Sibsagar describe themselves as Hindus, they have liberal notions with regard to diet, and eat pork and buffalo flesh and drink rice beer. Their marriages are somewhat costly affairs, and entail considerable expenditure upon food, which is

Males	...	...	9,372
Females	...	...	8,260

borne by the families of both contracting parties. Sexual intercourse before marriage is not regarded with much disfavour, and traces of polyandry are to be found in the fact that adultery with a member of the husband's family is considered less heinous than if the offence is committed outside the clan. The dead are usually buried, and the funeral ceremonies include a substantial feast. The Miri religion is of the ordinary animistic type. Its principal feature is the propitiation of malignant spirits likely to do harm. The tribe believe in the immortality of the soul, but do not attempt to dogmatize on the subject and are somewhat impressed by the fact that the dead never return to this world.

**The Nadi-
yals.**

The Doms, or as they prefer to call themselves Nadiyals, are the boating and fishing caste of Assam.

Males	...	...	11,815
Females	...	...	11,234

They are anxious to assume the name Jaliya Kaibartta, but the Kaibarttas are unquestionably a different caste, though their manners and customs do not differ materially from that of the Assamese Nadiyal, except in the following particular. The Kaibarttas decline to use the *ghokata* net, and in theory only sell their fish on the river's bank within a paddle's throw of the boat, whereas the Nadiyals regularly take their catch to market. The Nadiyals are probably descended from the aboriginal race of Doms, the ruins of whose forts are still to be seen in India, but migrated to Assam before the Dom caste had been assigned the degrading functions now performed by them in Bengal. They are cleanly in their habits and particu-

lar in their observance of the dictates of the Hindu religion, and account for the objectionable expression "Dom," which undoubtedly they have borne for centuries, by saying that they were the last of the Assamese to be converted from Buddhism. They are darker in complexion than most of the Assamese, but have a good physique, and by no means uncomely faces. Their women are most prolific, and the Dom villages are full of fat brown babies. They rank very low in the social scale, and, according to Assamese ideas, are superior only to the Brittil Baniya or Hari. The bulk of the caste still live by fishing, and education has made but little progress among them. Marriage does not take place till the girl is fully grown, and they are free from any puritanical notions with regard to the relations between the sexes. Their priests are said to be descended from a Brahman father and Nadiyal mother, but for all practical purposes they are Nadiyals and inter-marry with Nadiyal girls.

The Koches are one of the race castes of Assam. **The Rajbansi or Koch.**

Males	...	...	14,704
Females	...	...	13,027

Originally they were an aboriginal tribe, apparently of Mongolian origin, which at

the beginning of the sixteenth century rose to power under their great leader Viswa Singh. His son, Nar Narayan, extended his conquests as far as Upper Assam, Tippera, and Manipur, and by the middle of the sixteenth century the Koch king had attained to a position of such power that the aboriginal people were anxious to be enrolled as members of his tribe. The result is that at the

present day the name is no longer that of a tribe but of a caste into which new converts to Hinduism are enrolled. In Sibsagar and Lakhimpur these converts still retain their tribal names, and the Koch is a respectable Sudra caste, which is not broken up into various subdivisions. This is not the case in Lower Assam, and the different groups are there allotted a different status, which is dependent on the time that has elapsed since conversion took place and the extent to which aboriginal habits have been shaken off.

Religion.

Classified by religion, the population of Sibsagar was distributed in the following proportions in 1901—Hinduism 89 per cent; Animism 7 per cent; and Muhammadanism 4 per cent. The three principal sects of Hinduism recorded at the census of 1901 were Saktism, Sivaitism, and Vaishnavism.

**Hindus.
Saktists.**

Thirty per cent of the Hindus who returned their sect in 1901 described themselves as followers of Sakti, or worshippers of the reproductive powers as manifested in the female. Nearly five-sevenths of these Saktists were, however, censused on the tea plantations, and a considerable number of those living in the villages were probably ex-garden coolies. The great majority of these persons were no doubt so styled, because they ate meat and drank liquor, though this in a garden coolie is often not so much an indication of his adherence to the goddess Kali, as of the uncertainty of his title to the name of Hindu at all. Saktism is a foreign growth in Assam, and Vaishnavism is the national form of Hinduism.

Many of the Ahom kings were, however, supporters of the Saktists, and a list of the temples erected through their liberality will be found appended to this chapter.

Sivaitism is the counterpart of Saktism, and is concerned with the worship of the procreative energy as manifested in the male. In 1901, 8,090 persons in Sibsagar professed this special form of Hinduism. It is, however, doubtful whether the distinction between the worshippers of Siva and Sakti was very clearly understood. Sivaitism.

A considerable number of Hindus did not attempt to specify their sect in 1901, but of those who committed themselves to this extent nearly 68 per cent declared their adherence to Vaishnavism. The following description of the development of Vaishnavism in Assam is extracted from the Report on the Census of 1901. Vaishnavism.

"Sankar Deb, the apostle of Vaishnavism in Assam, was born in 1449 A. D., and was the descendant of a Kayastha, who, according to tradition, had been sent, with six of his caste fellows and seven Brahmans, to Assam by the king of Kanaijpur as a substitute for the Assamese prime minister, who had fled to his court for refuge. The licentious rites of Saktism had aroused his aversion while he was still a boy, and his desire to found a purer system of religion was increased by the teachings of Chaitanya in Bengal. Like most reformers, he met with vehement opposition from the supporters of the established order, and he was compelled to leave his home in Nowgong and to fly to the inhospitable jungles of the Barpeta subdivision. Here in conjunction with his disciple Madhab Deb, he founded the Mahapurushia sect, the main tenets of which are the prohibition of idolatry and sacrifice, disregard of caste, and the worship of God by hymns and prayers only. Sankar himself was, like a true follower of Chaitanya, a vegetarian, but the low-caste people who formed a larger proportion of his converts, found his injunction a counsel of perfection. The Mahapurushias are accordingly allowed to eat the flesh of game, but not of domesticated animals, though, with a subtlety only too

common in this country, they observe the letter of the law, prohibiting the spilling of blood, by beating their victims to death. The great centre of the Mahapurushia faith is the *sattr* at Barpeta, where a large number of persons persist in living, huddled together, in defiance of all the laws of sanitation, and resist with surprising pertinacity all efforts to improve their condition. They are a peculiarly bigoted people, and are strongly opposed to vaccination, with the result that the mortality from small-pox in the neighbourhood of the *sattr* is exceptionally high. It was not long, however, before the Brahmans re-asserted their influence, and shortly after Sankar's death, two of his followers, who were members of this caste, established sects, called, after their founders, Damodariya and Hari Deb Panthi, which are distinguished from the Mahapurushias, by the respect paid to the distinctions of caste, and a certain tolerance of idolatry. A fourth sect was founded by one Gopal Deb, but it originally seems to have differed in no way from the Mahapurushia creed, and subsequently its followers adopted the teachings of Deb Damodar. There is, in fact, practically no distinction between the Damodariyas, the Hari Deb Panthis, and the Gopal Deb Panthis, and the Vaishnavites of the Assam Valley can be divided into the Mahapurushia and Bamunia or 'other Vaishnavas,' as they have been called in the census tables. The former will accept a Sudra as a religious guide, worship no God but Krishna, and are uncompromising in their hostility to idols; the latter will only recognize Brahmans as their gossains, permit the adoration of other deities, such as Siva and Kali, in addition to that of Krishna, and allow sacrifices to be offered in their honour."

The Bamunias are also more liberal in their diet, and will eat goats, pigeons, and ducks, a form of food that is not allowed to orthodox Vaishnavites in Bengal. Madhab Deb, like most religious reformers, was a strict disciplinarian. The story goes that the breach between him and Gopal Deb arose one stormy day, when the party were returning to Barpeta by boat. Gopal Deb, anxious for the safety of his teacher, apostrophised the storm clouds passing overhead, and begged them to restrain their fury till Madhab had reached the shore in safety.

This innocent remark was construed into an invocation of Varuna, the god of rain. Gopal Deb was denounced as an idolater, and was incontinently, by order of Madhab, flung out of the boat. Such treatment was enough to damp the enthusiasm of the most ardent disciple. Gopal Deb, wallowing in the water, gallantly shouted out defiance to his former leader, and warned him that in future he would be treated with uncompromising opposition.

Sixty-three per cent of the Vaishnavites in Sibsagar were said to be members of the Mahapurushia sect. But it must not be understood from this that they are the adherents of the spiritual descendants of Sankar Deb, whose *namghor* is situated at Barpeta. Nearly all of them are followers of the Majuli gosains, and most of them should therefore have been classified as Bamunias.

There are many *sattras** in Assam, but four stand out pre-eminent above all others, Auniati, Dakhinpat, Garamur, and Kuruabahi. The first three are situated on the Majuli, are under the control of Brahman gosains, and are as strictly celibate as the mediæval monasteries. But their founder most sensibly made provision for the perpetuation of a line of priests trained up amidst the holy influences of a religious institution, and directed that the inhabitants of the Kuruabahi *sattra*, which is situated in Nowgong, should be allowed to marry. The gosains of the other three *sattras* are thus either brought from Kuruabahi, or from "little *sattras*" in close proximity to the main institution, in which there are families of married Brahmans. The Auniati and Dakhinpat

The *sattras*
of Sibsagar.

* A *sattra* is a religious college which is in some respects not unlike a mediæval monastery.

sattras both possess large grants of land, which were originally made by the Ahom Rajas and confirmed by the British Government. The Garamur *sattra* is also said to have been well endowed, by Sib Singh, in whose reign it was founded; but, at the time when the Commissioner was enquiring into the validity of the claims put forward by the various religious institutions in Assam, the gosain was absent at Brindaban and took no personal interest in the matter. The title deeds had been lost in the troublous times of the Moamaria insurrection and the Burmese invasion, there was no one to represent the *sattra*, and its claims were never submitted for the consideration of Government. The result was that such grants of land as it may originally have possessed lapsed to the state, and it is only recently that 1,000 *bighas** of land were given to it as an act of grace.

Source of
income.

The income of the gosains is, however, derived from other sources besides land. Every disciple is expected to make a small contribution in cash or kind each year to his spiritual leader. The demand is small enough, and does not generally exceed from four to eight annas in cash, with five seers of rice, and a handkerchief or other cloth woven at home, or a certain quantity of silk thread. This in itself is only a small tax upon the villager, but the aggregate of many such subscriptions serves to make the larger *sattras* extremely prosperous institutions.

In every village in which the gosain has any considerable number of disciples he appoints a local representa-

* 3.025 *bighas* are equivalent to one acre.

tive or *medhi*, * who either collects these contributions and conveys them to the *sattra*, or hands them over to a superior collecting officer termed *Raj medhi*. In return he is exempted from personally making any payment. He also receives fees from the villagers for attending the funeral obsequies of any of his fellow disciples, and generally enjoys a position of some dignity.

The following description of the *sattra* at Garamur The Garamur Sattra. gives a fair idea of the general appearance of the larger of these institutions. The building is approached by a good road, which has been constructed at some little expense by Nuniya coolies. They were paid from contributions received from the disciples of the gosain, as, even in the interests of so revered a man, the Assamese peasant will not consent to labour on the roads. The *namghor* itself is a huge structure, and, though the roof of corrugated iron seems somewhat out of place in such surroundings, within it is sufficiently spacious and gloomy to satisfy all the conventional requirements of a place of worship.

The roof is supported on huge wooden pillars, and the great floor space is almost entirely bare, save for one or two lecterns on which the sacred writings are reposing. The actual shrine is a separate building closely adjoining the eastern end of the *namghor*, and contains a single trinity of deities before whom offerings of fruit and grain are made. This shrine is very different from the *pene-tralia* of the Saktist temples. There are no traces of

* This official amongst the lower castes is often known as a *sajtola*.

blood or grease, there is nothing disgusting or grotesque, and the whole place is dominated by that note of decency and propriety which is so marked a characteristic of the Vaishnavism of the Majuli. The *namghor* is surrounded by gardens of flowers and fruit trees, and, in addition to plantains and graceful areca palms, there are various members of the citron family whose golden fruit shows bright against the dark green foliage. In a square around these gardens stand the lines (*hathi*) in which the *bhokots* (resident monks) live. They consist of well built rows of rooms, which are much more spacious than those ordinarily occupied by the Assamese and are kept scrupulously clean and neat. Nothing could exceed the courtesy of the welcome extended to any Government officer visiting the *sattrā*. The smiling monks flock round him, chairs are placed in the portico of the *namghor*, and the gosain himself is summoned. On the arrival of the holy man his followers fall upon their knees, and the gosain and his visitor sit and converse in the midst of a circle of kneeling monks. There is something singularly gracious and pleasing in the whole atmosphere of the place. Everything is fresh, and neat, and well to do. The well groomed smiling monks are evidently at peace with themselves and with the world at large, and even the little boys who flock around them are unusually clean and well behaved. These children are recruited from the neighbouring villages and trained up to be *bhokots*, but, if at any time they find the restraints of celibacy irksome, they are at liberty to return to the outer world.

The surroundings of the Dakhinpat *sattra* are even more attractive than those of Garamur. On entering the lich-gate, which is an almost invariable feature in these institutions, the visitor finds himself in a huge quadrangle. In place of the lawns of the Oxford Colleges there are great tanks whose banks are overshadowed by huge umbrageous trees. Auniati, on the other hand, is a less imposing place, as the neighbourhood is much exposed to flood, and the *sattra* buildings are crowded together on the highest land available.

**Dakhinpat
and Auniati.**

Altogether there are no less than 188 *sattras* in Sib-sagar, but very few of them possess any landed property, and nearly all are dependent on the contributions of their disciples. A list of these *sattras* will be found appended to this chapter. The following are the only *sattras* which hold any considerable grants of land. Auniati—revenue free 21,000 acres, half rates 600 acres ; Dakhinpat—revenue free 10,400 acres ; Kamalabari—revenue free 5,900 acres ; Bengnaati—revenue free 2,500 acres.

**188 Sattras
in Sibsagar.**

The Auniati *sattra* is said to have been founded by Niranjan Deb, a disciple of Gopal Deb, who in his turn was a follower of Damodar Deb. Jaiyadwaj Singh became a disciple of the gosain in 1653 A. D., and endowed the *sattra* with large grants of land. The gosain of that day took up his residence on the Majuli, which at that time was not separated from Rangpur by the Brahmaputra, as the main channel of the river then flowed down the Kherkutia Suti.

**Origin of
Auniati and
Dakhinpat.**

The Dakhinpat *sattra* was originally founded by Damodar Deb in the latter half of the sixteenth century in Kuch Bihar. He was succeeded by three gosains, Balodeb, Paramananda Deb, and Banamali Deb, who is said to have been endowed with more than human wisdom and sagacity. In 1653 A. D., during the incumbency of this priest, the *sattra* was moved from Kuch Bihar to a village in Sibsagar known as Majuli Rangoli Bahor. The gosain brought with him from Orissa an image of Vishnu, which is said to have been worshipped by Judhisthira, the hero of the Mahabharata. Like the gosain of Auniati, he was treated with much courtesy by Jaiyadwaj Singh, who endowed the *sattra* with large grants of land.

**Muhamma-
dans.**

In 1901, there were 24,878 Muhammadans in Sibsagar which was equivalent to 4 per cent of the total population. The great majority of these persons are Sunnis, and it is said that in places the Muhammadan villagers are still imbued with Hindu superstitions. *Mantras* are occasionally chanted in times of trouble, Ai is invoked when small-pox has appeared, and some even go the length of sacrificing fowls and pigeons. The Morias are a section of degraded Muhammadans who are said to be the descendants of prisoners who were captured when Turbuk was defeated and killed in 1532 A. D. They were employed in various capacities for which they showed themselves to be quite unfitted and were finally made braziers. They are said to be dirty and addicted to drink, and are regarded with contempt by their co-religionists. Outside the towns there are few masonry

mosques, and worship is usually conducted in a thatched hut which has nothing in its appearance to suggest that it is intended for a place of prayer. There are no propaganda for the dissemination of the faith, and Muhammadanism is said to make few if any converts. In Sibsagar the Darga or grave of Komaldya Khunkar Muhammad Gani, which is situated in Chokola village in the Banmukh mauza, is regarded as a place of peculiar sanctity, and is visited by pilgrims every year.

Most men find considerable difficulty in giving a clear **Animism**

Males	...	...	20 788
Females	...	...	18,415

and intelligible account of the faith that is in them, and the simple aboriginal tribes

are no exception to the general rule. Broadly speaking their religious beliefs seem to fall under the following heads. Unlike the German metaphysician, they have no uncomfortable doubts with regard to their own existence and the existence of the material world. To account for the production of these visible phenomena, they put forward various theories, which are hardly more improbable than the accounts of the creation given in most religious systems. The way in which the world came into existence is, after all, a matter of no very great importance, and the essential object of religion is to ensure a comfortable passage through life to its followers. No country or community is exempt from pain and trouble, and to the dwellers in the plains of India has been allotted a fairly liberal portion of the ills of life. When the cattle die, or small-pox or cholera visit the village, or other trouble comes, it is only natural to

suppose that somebody or something is the cause of these misfortunes. The simple tribesmen then endeavour to ascertain the particular spirit from whose displeasure they are suffering, and to appease him in whatever way they can.

From Table IV it will be seen that there are hardly any members of the animistic tribes in the Sibsagar subdivision, and most of those censused there were Kacharis from Lower Assam employed on tea gardens. The Mikir Hills are in fact the great centre of the animistic population, and, except for a few Miris, there are hardly any unconverted tribesmen in the Sibsagar plain.

Minor Religions.

The religions which were not strongly represented in the district in 1901 were Buddhists (1,668); Jains (197); Brahmos (36); and Sikhs (17). The Buddhists are immigrants from the Shan States, who settled in Assam at the end of the eighteenth and beginning of the nineteenth centuries and are locally known as Noras, Turungs, and Aitoneas.*

The Jains are the shrewd Marwari merchants to whom reference has been already made, and the Sikhs were men in the employ of the Assam-Bengal Railway Company.

Christians.

Sibsagar contains more native Christians than any other district in the plains, with the exception of Goalpara and Lakhimpur. Of recent years they have been steadily increasing in numbers, as in 1881 there were only 462 native Christians; in 1891, 1,048; and in 1901, 2,113. There is a branch of the American Baptist Mission in

* For an account of these colonies see Chapter X of the Census Report for 1891.

Sibsagar town and more than half of the native Christians professed themselves to be members of this sect.

Agriculture is the staple occupation of the people, and **Occupation.** the proportion of agriculturists in 1901 (91 per cent) was unusually large, even for an agricultural country like Assam. The bulk of these persons were petty landholders who held direct from Government, but the number of garden coolies was also very large. Fishing was the only other industry which supported as much as one per cent of the population. In 1901, the occupations of the people were classified under 520 different heads, and details for the great majority of these heads will be found in Table XV, Part II, in the second part of the Census Report. These figures do not, however, lend themselves readily to review. The proportion of workers to the total population (63 per cent) is unusually high. This is due to the fact that the wives and daughters of the ordinary cultivator work in the fields, and to the large number of garden coolies whose children begin to work at a very early age.

The forms of marriage in vogue are the *hompura*, **Marriage customs.** or full Hindu rite, when the sacred fire is lighted and a priest is engaged to perform the ceremony, the *kharu moni pindha* or *juran*, in which a feast is given to the friends and relations and ornaments are given to the girl, the system under which the bridegroom, who is called a *caponiya*, enters the house of his prospective father-in-law, and works for his wife as Jacob worked for Rachel, and the *chaklong* rite amongst the Ahoms

which has already been described. Brahmans, Kayasthas, and well-to-do Kalitas invariably perform the *hompura* ceremony, which may cost anything from fifty to two hundred rupees or even more*. This expenditure is incurred on the purchase of ornaments and clothing, on the payment of priests, musicians, and palki bearers, on the hire of elephants and horses, and on a feast to the relations and friends, the principal ingredients of which are rice, molasses, curds, and betel-nut.

The practice of taking a bride price used to be common but is going out of fashion, and is no longer considered to be quite good form. This perhaps is just as well, as marriage under any circumstances entails an expenditure which is often considerably more than the bridegroom can afford. Assamese girls are generally not married till they are old enough to develop tastes and inclinations of their own, and personal feeling is occasionally opposed to mere prudential considerations. A girl may, perhaps, have been courted for some years. Each *bihu* her lover has brought loads of rice, plantains, curds, and even pieces of opium to her father, and then at the last moment she goes off with some one else. The aggrieved suitor naturally seeks to be reimbursed for his expenditure, and the father in his turn endeavours to extort the money from the favoured man. These elopements or abductions are especially common at the *bihu* time. To protect her reputation the girl

* A description of this ceremony as practised in Assam will be found on p. 63 of the Census Report for 1901.

usually pretends to be carried off by force, but the very scene of the elopement is pre-arranged, and her lamentations are not as genuine as they are hearty. Any one in fact who wishes to see real grief and indignation should stumble, as is occasionally done by chance, on an abduction that has failed, when disappointment renders the young lady utterly incapable of concealing her real feelings.

Feasts, singing parties, and *bhaonas* or simple theatrical performances are the principal amusements of the villagers. The *bhaonas* are often held in temporary sheds constructed by the roadside, and on a winter's morning the traveller who is early abroad frequently comes upon parties of revellers still lingering over the pleasures of the previous night. The *dol jatra* or festival in honour of Krishna in February or March, when the image of the god is swung to and fro and the people pelt one another with red powder in memory of his amorous exploits with the milkmaids of Brindaban, is not much in favour with the Assamese. Foreigners, on the other hand, whether still residing on tea gardens, or living in the villages, are great observers of the *fagua* as it is called. There is naturally a good deal of drinking, and garden managers always hope that the spring rains will break before this festival occurs, so that the risk of some drunken cooly accidentally firing the lines may be diminished. The *Janmastami* in honour of Krishna's birth in August or September, and the *Sivaratri* in memory of Siva in March, are kept

Amuse-
ments and
festivals.

as fasts rather than feasts. The Durga Puja is observed by Saktists.

The Bihus.

The special festivals of the Assamese are the three *bihus* and the *sradh* ceremonies of Sankar Deb and Madhab Deb, the founders of the Mahapurushia sect. The Kartik *bihu* is celebrated on the last day of Asvin (October 14th), and is not an occasion of very much importance. Hymns are sung in honour of God, and, in place of their usual meal of hot rice and curry, the people take cold food, such as curds, molasses, plantains and cold rice. The Magh *bihu* is the harvest home, and begins on the last day of Pous (January 14th). For weeks beforehand tall heaps of rice straw piled round a central pole are a prominent feature in the rural landscape. At the dawn of day the villagers bathe and warm their chilled bodies at these bonfires, a very necessary precaution as at this season of the year the mornings are always cold and generally foggy. The Magh *bihu* is to some extent a children's festival, and most of the jollification is confined to the smaller boys who sing and dance, and feast in small grass huts that have been constructed for the purpose. The Baisakh *bihu* which begins on the last day of Choet (April 14th) is in honour of the new year. The cattle are smeared with oil mixed with matikalai, turmeric, and rice, and are then taken to the nearest stream and bathed. The villagers go from house to house visiting their friends and relatives, and offer them presents of cloths and other things. Buffalo fights are organized in the rice fields

but these contests are rather tame affairs, and the animals very seldom injure one another. This *bihu* is an occasion of some license as boys and girls dance together in the fields and sing suggestive songs, and lapses from chastity between members of the same caste are considered almost venial. This is the season of the year when run-away matches are most common, and during the next few weeks the outraged but avaricious parent, complaining of the abduction of his daughter, is by no means an uncommon sight in the local courts. The *sradh* ceremony of Sankar Deb is celebrated in August-September, and that of Madhab three days before the *Janmastimi*. All work is laid aside on these two days and the people devote their time to feasting and the singing of *hymns*.

CHAPTER IV.

AGRICULTURE AND FORESTS.

Crops grown—Rice—Mustard—Pulses—Fibres—Storage and threshing of grain—Agricultural implements—Sugarcane—Preparation of molasses—Causes affecting productiveness of land—Garden crops—Yield and value of crops—General remarks—Grazing—Livestock—Cattle disease—Protective embankments—Commencement of tea industry—The boom in the early sixties—Collapse in 1866—Expansion of the industry—Labour supply—Labour laws—Situation of tea gardens—Soil—Varieties of plant—System of cultivation—System of manufacture—Green tea—Outturn and prices—Forests—System of management—Situation of reserves and revenue they yield—List of important reserves.

**Crops
grown.**

The staple food crop of Sibsagar is rice, which in 1902-03 covered 63 per cent of the total cropped area of the district. Other important crops are tea (15 per cent), and orchard and garden crops (8 per cent). A large part of the area shown under the latter head is, however, occupied by the homestead, and it is doubtful whether as much as one half is actually under cultivation. Mustard occupied 4 per cent of the total cropped area, miscellaneous food grains, nearly all of which are different forms of pulse, 3 per cent, and sugarcane 1.5 per cent. Wheat barley, and gram, the food grains of Upper India, are grown in small patches by immigrants from those parts, but the total area under these three crops in 1902-03 was

only 50 acres. A small quantity of maize is also grown by foreigners. The general system of cultivation and the manner in which the staple crops are raised is described in the following paragraphs. The area under different crops will be found in Table VII.

Rice falls under three main heads—*sali*, *ahu*, and *bao*, Rice. Sali. the proportion of the total rice area normally occupied by each of these three classes being—*sali* 92 per cent, *ahu* 7 per cent, and *bao* 1 per cent. *Sali* dhan, or transplanted winter rice, is first sown in little beds or nurseries (*kothiatoli*) near the homestead. The land is broken up in April or May, is ploughed five or six times till the ground is reduced to a puddle, and is carefully manured with cowdung and sweepings. The proportion borne by the seedling beds to the area under transplanted rice varies from 4 to 10 per cent. This is due to the fact that in poor fields close transplanting, a span apart (*bigutiya*), is necessary. In ordinary good land the seedlings are usually a cubit apart (*hatiya*), while in exceptionally good soil they are sometimes placed the width of a fishing basket apart (*pulshchabiya*). The seed, which has been selected from the largest ears of the previous year's crop, is steeped in water for two or three days, allowed to germinate, and then sown broadcast over the bed in May and June. It comes up a rich emerald green, and at the beginning of summer these patches of the brightest green herbage are a striking feature in the rural landscape. In the meanwhile the fields are being got ready for the reception of the seedlings. The

husbandman starts ploughing as soon as the soil is softened by the spring rain, and repeats the process from four to eight times, till he has reduced the land to a rich puddle of mud. After the third ploughing the field is harrowed, the little embankments, a few inches high, intended to retain the water, are repaired, and if the fields adjoin the road or the village site they are fenced in with split bamboo. When the seedlings are about seven or eight weeks old, they are taken from the nursery bed and carried in large bundles (*akhi*) to the field. Here they are planted out in handfuls (*muthi*), each of which contains four or five plants. It is usually the practice to steep the young plants in water for a day or two before they are planted out, and, unless they are weak and stunted, the tops are cut off at the time when they are removed from the nursery. Transplanting goes on from the beginning of July to the middle of September, and is generally carried out by women. The work is of a most arduous description, and involves stooping for hours in a field of liquid mud, under the rays of a burning tropical sun. In places where it is difficult to obtain labour to transport the seedlings the grain is sometimes steeped in water till it germinates and is then sown broadcast on the field. Before the end of the rains the crop is fully grown, though the ears are still empty, but about the beginning of October they begin to fill, and the field to turn to a rich yellow. From the middle of November to the middle of January harvesting is going on. Women grasp a handful of the ears and cut them off about eight inches below the head. These handfuls (*muthi*) are tied up with a

piece of straw and left in the field for a few days to dry. When the grain is ready to be transported to the granary, the *muthis* are made into larger sheaves. Six to eight *muthis* form a *thor* or *jhap*, and five or six *thors* a *dangari*. A *dangari* is then affixed to either end of a sharp pointed bamboo called *biriya*, and the load, which is called a *bhar* and carried across the shoulder, is taken to the homestead by the men.

The different kinds of *sali* dhan fall under two main divisions, *lahi* and *bar*. *Lahi* ripens earlier than *bar*, and, though the grain is of a finer quality, the yield is appreciably smaller. It is planted on the higher fields which dry up first at the conclusion of the rains, and which cannot therefore be cropped with the more productive *bar* dhan. Altogether there are said to be no less than 74 different varieties of *sali* dhan in the district.

Bao dhan is sown broadcast about the end of **Bao dhan.** February, the field having been previously prepared by four or five ploughings. It is grown in flooded tracts, and the embankments made between the fields are smaller than in the case of *sali*, and are sometimes dispensed with altogether. It ripens about the beginning of December and is harvested in the same way as *sali*. The total area under *bao* is less than 2,000 acres and about half of this is grown in the Salmara mauza.

Ahu dhan also is usually sown broadcast, and is **Ahu dhan.** grown under two different sets of conditions. The greater part of the *ahu* raised is sown on the *chapolis*, or

high-riparian flats which fringe the Brahmaputra. The usual procedure is as follows :—

In May, the jungle is cut down and sometimes burnt, and the land left till towards the end of the rains. If any jungle has sprung up in the interval it is cleared in the same way, the process being known as *gojala kata*, and ploughing begins in January. The field is ploughed three times and harrowed, and the clods are broken up by a mallet. Another ploughing and harrowing follow, the seed is sown, and the land again ploughed and harrowed, to ensure that the grain becomes thoroughly mixed with the soil. When the plants are about six inches high and catch the wind (*botah boloah*) they are harrowed again and weeded, and finally harvested about the middle of June. The crop is, however, a precarious one, and is liable to be destroyed by a sudden rise of the river. The plants can live under water for as much as a week, but if after this time the floods do not retire they are permanently destroyed. *Ahu* is often grown on the *chaparis* in conjunction with mustard, and no jungle cutting is of course required when the soil has been already cleared for the oil seed crop. The same field is seldom cropped for more than three years in succession. The weeds which were unable to find a lodging under the dense growth of *ikra* (*saccharum arundinaceum*), *khagari* (*saccharum spontaneum*), and *nal* (*phragmites roxburghii*), with which the land in its natural state is covered, soon spring up when once the reeds have been burned. After the third year it is less trouble to burn fresh jungle than to clean the old fields of weeds, and by a change of site

the peasant gets the further advantage of the manure of ashes and silt for his next year's crop.

Nearly three-fourths of the *ahu* crop is raised on the Majuli, and most of the remainder is grown on the *chapolis* south of the Brahmaputra in the Jorhat and Golaghat subdivisions, *i. e.*, in the Chaokhat, Charigaon, Hezari, Rangamati, Michamara, and Namdayang mauzas. In the more densely settled portions of Jorhat the custom is gradually coming into vogue of taking a crop of *ahu* from land which is subsequently planted out with *sali*. This is, however, only done where the soil is fairly light, as a stiff and sticky clay is too hard to plough before the ground has been well moistened by the rain. *Ahu* is hardly grown at all in the Sibsagar subdivision.

A variety of transplanted rice called *ras* or *gethu* has Ras rice. been recently introduced into the district by Bengali coolies. It is grown near the homestead on the higher *rupit* lands, is transplanted and reaped rather earlier than *sali* and yields a particularly fine quality of grain. This rice has largely taken the place of transplanted *ahu*, of which there is very little in Sibsagar.

Mustard, as has already been said, is usually grown Mustard. in conjunction with *ahu* on the riparian flats. The jungle is cut down in February and March, and, if the land cannot be prepared in time for summer rice, is allowed to rot upon the ground. What remains is burned in October, the stumps are dug out, and the land is then ploughed over four or five times. The seed is sown about the beginning of November, and the plant is

ready to be pulled from the field about the middle of February. It is generally left to dry for a few days, and is then threshed either in the field in a place prepared for the purpose or near the homestead. Mustard is generally grown in conjunction with summer rice (*ahu*), and about two-thirds of the total district crop is raised in the Majuli. A certain quantity is also grown in the *chapolis* of Jorhat and Golaghat; Baligaon and Hezari being the principal mustard mauzas of the former subdivision and Michamara and Rangamati of the latter. Mustard is seldom grown in the *sadr* subdivision of the district.

Pulses.

Pulse is usually grown on the alluvial flats that fringe the Brahmaputra, in conjunction with summer rice and mustard, but a crop is often taken from the land on which rice seedlings, early rice, and sugarcane have been grown, as it is generally and rightly thought to improve the quality of the soil. In the *chapolis* if new land is taken up the first proceeding is to cut and burn the reeds and grass. Only two ploughings are required, and those are of the very lightest character, and, if the ground is naturally clear of jungle, the seed is sometimes simply sown on the river flats as soon as the floods subside. Pulse is also scattered broadcast amongst the rice stubble, or between the *sali* plants, if the land is still soft, but this method is not generally in use. The seed is sown in September and the crop is ripe about four months later. The plants are pulled up by the roots, left for a few days in the field to dry, and are then collected at the convenience of the cultivator. The seeds are threshed out by cattle, but, as the grains do not

separate readily from the pods, their efforts are supplemented by a man with a flail. Several different kinds of pulse are grown, but nine-tenths of the crop belong to the variety known as *mati-mah* (*phaseolus mungo radiatus*). Other kinds are *magu-mah* (*phaseolus mungo* Linn.), a species which has a smaller yield and requires more careful cultivation but commands a higher price and possesses a more delicate flavour. It is seldom grown except on the river *chapolis*. *Kala-mah* (*lathyrus sativus*) is grown but not in any considerable quantities. It has a large yield but does not fetch a high price. Another variety is the lentil *masur-mah* (*lens esculenta*) which is grown in the Majuli.

Jute is grown in small patches as a garden crop. The **Fibres.** seeds are generally sown in April, and the plants are cut in August and September, stripped of their leaves, tied in bundles, and left to rot in pools of water for from seven to twelve days. When they are ready a handful of stems is taken up, broken in the middle, and beaten to and fro in the water, till the inner part drops out and only the fibre remains. The bundles of fibre are then dried and are ready for use. Small patches of rhea (*bæhmeria nivea*) are grown in the gardens of the fishing castes, where it is heavily manured. The skin is stripped off from the stem and the fibre separated from the outer covering. The thread obtained is exceptionally strong and durable, but the difficulty of decortication has hitherto prevented the growth of rhea on a commercial scale.

**Storage and
threshing of
grain.**

The grain is usually stored as it is brought from the field in an outhouse called *bhoral*, which, unlike the houses of the villagers, is raised on posts well above the level of the ground. When it is required for use the sheaves are untied and spread over the courtyard. Cattle are then driven round and round over the heap of grain and straw till the ears have been finally separated from the stalk.* The grain is next passed through a sieve, and placed in a flat bamboo tray called *ku/a*. It is then jerked into the air and allowed to fall back into the tray, or held aloft and allowed to fall slowly to the ground, till gradually the chaff is carried off. After threshing the paddy is stored in huge drums called *mer*. They are made of split bamboo, and the outer surface is plastered over with clay and cowdung.

**Agricultural
implements.
The plough.**

The agricultural implements in use are of a very simple character. The plough is usually made of the jack fruit tree or some other hard wood, and consists of three parts—the handle and body which are usually all in one piece, the pole which joins the plough at the junction of the handle and the body, and the yoke which is merely a piece of wood, fastened by rope at right angles to the pole, with pegs affixed to it to keep it from sliding from the necks of the bullocks. The front portion of the body is sharpened to a point which is shod with iron, and in soft soil a piece of bamboo is sometimes substituted for the iron. This piece of iron is the only portion of the plough which the farmer has to purchase. The rest he

* An experiment made by Mr. Darrah, Director, Department of Land Records and Agriculture, showed that nine bullocks took 2 hours and 8 minutes to thresh out $7\frac{1}{2}$ maunds of paddy.

makes for himself. The whole instrument is suited to the wretched class of animal required to draw it. It weighs as a rule about 20 lbs., and the yoke seldom stands as much as 36 inches from the ground. It is obvious that such an implement can only penetrate from three to four inches into the soil, but the wretched quality of the plough cattle prohibits the use of a more effective instrument.

The harrow (*moi*) is generally a bamboo ladder, about eight feet in length, on which a man stands as it is drawn across the field. It is used to crush the clods turned up by the plough before mustard or summer rice is sown, and to reduce the fields required for wet rice to puddle. Its place is sometimes taken by a plain log of wood. It is prepared by the cultivator himself from the bamboos growing in his garden. Clods are broken by the mallet (*doli mari*) which is also made at home. Hoes (*ko-talis*) are used to trim the embankments (*alis*) which help to retain the water. The head is bought in the bazar and costs from Re. 1 to Re. 1-4, and is fitted with a shaft by the farmer himself. Sickles (*kuchi*), with which the rice is reaped, have also to be purchased, and cost from two to four annas. In *ahu* cultivation a large wooden rake (*bindha*), with teeth nearly one foot in length, is dragged over the crop by a bullock when the plants are about six inches high. The *nirani*, a kind of trowel with a long handle, is used for weeding *ahu* rice. The sugarcane mill is described in the paragraph dealing with the preparation of molasses. The ordinary implement used for husking grain is the *dhaki*, a long beam with a pestle affixed at

Other im-
plements.

the end, which is supported by two posts at about two-thirds of the length from the head. The shorter end is depressed by the foot, and the pestle is thus raised into the air ; the weight is then removed, and the pestle falls into a small mortar buried in the ground in which the grain is placed. The *dhaki* is the implement ordinarily employed by the Assamese to husk their rice or pulse, but the animistic tribes generally use a large wooden mortar (*ural*) and a pestle (*mari*). All of these implements are made at home.

Sugarcane.

Sugarcane (*saccharum officinarum*) is usually grown on high land near the village site, and, as the soil is poor, it has to be well manured with cowdung. The crop is propagated from the tops of the best canes which are cut off at harvest time and kept in a shady place. One of these tops yields on the average about five canes, and, as they contain but little juice, the cultivator does not sacrifice much of the gross product of his fields in the cause of reproduction. Four principal varieties of the plant are recognized. The *maq* or white stands about seven feet high and has yellow canes of a soft juicy texture. The *teli* is shorter, harder, and thinner, and the canes are of a deep red or even purple colour. There are two varieties of *pura*, the purple or indigenous, and the white or Bengali. The latter is the larger and the more juicy of the two but yields a smaller proportion of sugar. The *megela* is a hard and thin variety degenerated from the *maq* and is seldom cultivated. The land is hoed up till it is reduced to a fine tilth and the tops planted in trenches between April and June. The patch

is fenced with split bamboo, and there is usually a stout hedge of arhar dal (*cajanus indicus*), but constant watching is required to scare away jackals and other animals, and an empty oil tin with a clapper is generally to be seen suspended over each field. While the crop is growing it is continually hoed and weeded, and about August the leaves should be tied up round each cluster of canes, though this troublesome precaution is occasionally neglected. The earth from the ridges is heaped about the roots to strengthen their hold upon the soil, and this process is continued until the relative positions of ridge and trench are reversed, and the canes stand upon ridges with the trenches in between. Harvesting goes on from January to April, and during the winter nights and in the foggy mornings the drone of the sugarcane mill is heard coming across the fields in nearly every part of the district where the "works of men" are to be seen.

The area under sugarcane in Sibsagar in 1902-03 was over 8,000 acres, which was nearly double the area returned from any other district in Assam Proper. It is grown in small patches in every part of the district, but the principal centre of the industry is the country lying on either side of the Golaghat-Naghereting road, which is included in the Maukhoa, Dhekial, Michamara, Naharani, and Gurjogania mauzas. The Panidihing mauza and the Jorhat tahsil are the only two revenue units in the Sibsagar and Jorhat subdivisions in which much cane is raised, as in the mauzas south of the Dhodar Ali the plant has been attacked by a malignant fungus.

**Preparation
of molasses.**

The native form of mill is still generally used for the extraction of the juice from sugarcane. It consists of two wooden rollers fixed side by side in a trough hollowed out of a heavy block of wood. The tops of the two rollers pass through a hollow beam supported by uprights let through the lower block of wood into the ground, and are cut into the form of screws which fit into one another. To the larger of the two (*mota bhim* as distinguished from *maiki bhim*) is affixed a pole, which is driven round in a circle, and thus causes the rollers to revolve. The motive power is usually supplied by the villagers themselves, but buffaloes are occasionally used for the work. The mill requires rather more knowledge of carpentry for its production than the other implements of agriculture, and can only be made by the more skilful of the villagers. The cane is placed between the rollers and crushed as it is slowly forced through. Each handful is passed through the mill three or four times, till nothing but foam appears. The juice trickles from the trough into an earthen vessel and is then transferred to a small boat scooped out of a log. When twelve or fifteen gallons have been collected boiling begins. The furnace is hollowed out of the ground and has four circular openings to receive the cauldrons, which are made of the most durable kinds of potter's clay. Two of these vessels are placed about nine feet from the furnace mouth, and only serve to heat the juice before it is transferred into the other vessels to be boiled. When the juice has been reduced to the proper condition, it is ladled into a wooden vessel (*gholani*) shaped like a small dug out, and

is stirred for half an hour. As the stirring continues, the liquid loses its dark brown colour and assumes the consistency and hue of yellow mud. It is then stored in earthen pots and the process is complete.

The fertility of the rice fields mainly depends upon the following five causes, the water supply, the quality of the soil, and the liability to injury from flood, wild animals, or shade. The first-named factor is probably of most importance. The soil of the district varies from pure sand near the Brahmaputra to clay so stiff as to be utterly unfit for cultivation. The land best suited for the growth of rice is a clay loam *alatia*, the most fertile variety of which is called *bherbheria* and is particularly deep and soft. *Bherbheria* land is found at the lowest part of the rice basins and when enriched by the drainage from the village site is generally known as *charanpara*. The animals which do most injury to the crop are pigs, elephants, and monkeys. Elephants leave disastrous traces of their presence, but luckily do not remain long in any one locality, and are generally only found in the country lying at the foot of the Naga Hills. Serious damage is sometimes done by insects which are called *keonkata*, *tupalia*, *gandhi* (*leptocorisa acuta*) and *charaha* (*hispa acussceus*). The *gandhi* is a small bug which injures the rice plant by feeding on the stems and sucking all the sap from the young grains. It is most prevalent in July and August and is particularly in evidence during a spell of hot dry weather. High wind and rain drive it back into the jungle, and good results are obtained by lighting fires of vegetable refuse to windward. The

Causes
affecting
productive-
ness of land.

best remedy of all is to collect the insects by smearing a winnowing fan with some glutinous substance and brushing it over the ears of grain, when many of the bugs will be found adhering to the fan. This remedy should be tried in the morning or late afternoon, as the insects do not feed in the heat of the day. The *charaha* is a tiny beetle, which eats away the outer surface of the leaves and stalks, and thus affects the outturn of the crops. It attacks the young plants in the nursery and can most easily be destroyed there by spraying.* Smoking the fields also produces good results, but must be continued for some days or the beetles will return. Rain is wanted when *sali* rice is sown and is transplanted, but is not needed for the sowing of *ahu* and *bao*. During every stage of its growth the plant is benefited by moderate showers, but rain is absolutely essential at the time when the ears are first appearing. Emphasis is laid on this necessity in the local proverb *tini haone pan ek ahine dhan*, which means that a pan vine that lasts for three years, and dhan which gets rain in Asvin (September 15th to October 15th) are both very profitable things. Hail storms in December sometimes lay the crop and add materially to the cost of reaping, but fortunately are very local in their action.

Garden
crops.
The plan-
tain.

One of the most valuable of garden crops is the plantain (*musa sapientum*). As many as ten main varieties of this tree are recognized, but the most important are those known as *athia*, *monohar*, *chenichampa*, and

* The best solution is 1 lb. Paris Green, 1 lb. freshly slaked lime or flour and 150 gallons water. The solution should be kept constantly stirred and should be sprayed on with a fine sprayer.

malbhog. The first two groups are again subdivided into a considerable number of different species. The commonest form of *athia* is called *bhim*, a large tree which is found growing in the garden of nearly every house. The fruit is considered cool and wholesome, and is very generally used as food for infants. The *monohar* is a somewhat smaller tree, the pulp of the fruit is white and slightly acid in taste, and is largely used in combination with soft rice and milk at village feasts. The *malbhog* and *chenichampa* are small trees, whose fruit is much appreciated by Europeans. The *athia* plantain is generally grown near the homestead, where it can obtain a plentiful supply of manure ; but the finer varieties are planted at a little distance to protect them from the earthworms, whose attacks they are hardly strong enough to resist. Sandy soil and heavy clay check the growth of the plant, and anything in the shape of water-logging is most injurious. The trees are planted in holes about a foot wide and eighteen inches deep and are manured with cowdung, ashes, and sweepings. Young saplings take from 18 months to two years to flower, and the flowers take from three to six months to turn to fruit. The plantain tree plays many parts in addition to that of fruit purveyor. The flower is much esteemed as a vegetable, the leaves serve as plates, and the trunks are used for decorative purposes on occasions of ceremony, and as food for elephants. An alkaline solution, distilled from the sheaths and the corm, is sometimes used in place of salt. These portions of the tree are sliced, dried, and reduced to ashes. The ashes are placed in an

earthen pot, in which there are several holes lightly plugged with straw. Water is then poured over them, which dissolves the alkali and trickles through the holes into the receiver below. The resulting product, which is known as *kharpani*, is used as a spice, as a hair-wash, and as a mordant with certain dyes.

Other
garden
crops.

The betel-nut (*areoa catechu*) is grown almost as universally as the plantain, and with the bamboo, forms the great trinity of trees in which the houses of the Assamese are usually embedded. The plantation is hoed up, and kept clear of weeds, and the trees are most liberally manured with cowdung. The pan vine (*piper betle*) is frequently trained up their stems, and the leaf and nut, which are invariably eaten in conjunction, are thus grown side by side. Tobacco is a plant which is to be seen growing in the majority of gardens. The seedlings are raised in carefully manured beds in August and September. At the beginning of November they are transplanted into ground which has been reduced to a fine tilth, watered for a few days, and protected from the sun by little sections of the plantain trunk. The bed is lightly hoed up two or three times, and not more than ten or twelve leaves are allowed to grow on each plant, the remainder being picked off as they appear. The leaves are first gathered in February and March, and there is a second but much inferior crop about two months later. If required for chewing, they are either dried under a shed, or else pressed into a hollow bamboo (*chunga*) and allowed to ferment. When the tobacco is destined for the pipe, though this is not the use to which it is generally put, the

leaves are piled up in heaps till they ferment, cut up and mixed with molasses, and then are ready for the hookah. The commonest forms of vegetable grown are spinach, *puroi* (*basella alba*), *lai*, a species of *brassica*, different kinds of arums (*kachu*), different kinds of yams (*discorea*), and gourds, the country bean *urahi* (*dolichos lablab*), the common mallow *lafa* (*malva verticillata*), the radish *mula* (*raphanus sativus*), the sorrel *chuka sag* (*rumex vesicarius*), and the brinjal (*solanum melongena*). Potatoes are grown in the Majuli and in a few villages near the south bank of the Brahmaputra.

The outturn of different crops varies according to the character of the season, and also to a great extent according to the character and level of the soil on which they are grown. The statement in the margin shows the normal yield per acre laid down by the Agricultural Department after a long series of experiments. These figures only represent a general mean and even in a normal year there are many fields whose outturn varies largely from the average. The yield of rice, it may be premised, is expressed in terms of husked grain. The prices obtained by the raiyats vary very materially in different parts of the district, and it is impossible to lay down any general average.

Molasses ...	...	2,200	

per acre laid down by the Agricultural Department after a long series of experiments. These figures only represent a general mean and even in a normal year there are many fields whose outturn varies largely from the average. The yield of rice, it may be premised, is expressed in terms of husked grain. The prices obtained by the raiyats vary very materially in different parts of the district, and it is impossible to lay down any general average.

Manure is not generally used except for garden crops and sugarcane, though, here and there, a raiyat is found with sufficient intelligence and industry to spread some cowdung on his rice fields. There is little tendency to

introduce new crops or to improve upon old methods, but the cultivation of potatoes is said to be slowly spreading, especially in the Michamara mauza, and in central Golaghat a little jute is grown. No efforts are made to improve the character of the crop beyond selecting the best grain for seed. Even this common sense precaution is occasionally mixed up with superstition, and seed is chosen because the plant from which it was taken was planted or reaped when the moon was on the wane.

Grazing.

Cattle are generally grazed on the high land between the rice fields, in swamps and marshes, where excellent pasture is to be obtained during the cold season, and on the stubble that remains after the crop is cut. In the district as a whole there is no doubt abundant grazing of a kind, but it is not always well distributed, and in places the villagers during the rains are hard pressed for fodder. The finest grazing is to be found on the Majuli and in the marshes which fringe the Brahmaputra, and it is here that the professional herdsmen keep their buffaloes. Certain areas have been reserved as grazing grounds by executive order, but rules for their reservation have not yet been framed, though in the more densely-settled portions of the district it would seem that they would not be entirely out of place. In these tracts, during the rains, cattle have sometimes to be sent to other villages to graze, or are stall fed on rice straw which has been previously collected for the purpose.

The buffaloes of Sibsagar belong to three main breeds, **Buffaloes.** the Assamese, the Nepalese, and the Bengali. The Assamese is the finest and largest of the three, and, in the more jungly parts of the district, the excellence of the breed is to some extent maintained by an infusion of wild blood, wild bulls associating with the herd and becoming the sires of many of the calves. The Nepalese buffaloes have shorter horns than the Assamese, and the Bengali is altogether a smaller and less imposing animal. An Assamese bull buffalo usually costs from Rs. 40 to Rs. 60, while a cow is from 10 to 15 rupees more. Bengali buffaloes of either sex are considerably cheaper than the Assamese. Pure bred Assamese buffaloes are unfortunately becoming scarce, and crosses between the three breeds are extremely common.

Buffaloes rarely get anything but grass and a little salt to eat. In the cultivated portions of the district they are usually placed in charge of a small half-naked boy, whose legs can hardly stretch across the massive back of the animal he bestrides, and who guides it with a nose rope. In the *chuparis*, the herd is driven out to graze in the jungle and follows the lead of the older cows, whose whereabouts is indicated by the metal or wooden bells that are dangling from their necks. The *mo-khutis*, as these grazing camps are called, are to be found in the jungle covered *chuparis* on either side of the Brahmaputra, and are especially numerous on the Majuli, where there are between sixty and seventy of them, and in the Thaura Panidihing mauza in the

extreme east of the district. They are usually kept by Nepalese who make a livelihood by selling milk and *ghi*. A cow is said to remain in milk for about ten months, and yields at the beginning from two to four seers every day. The amount gradually decreases till a month or so before the next calf comes, when it ceases altogether. The milk is very white and rich in fatty material, and consequently yields a large proportion of *ghi*. The cows are said to begin breeding when three years old, and to continue doing so for fifteen years, during which time they give birth on the average to about ten calves. The normal life of a buffalo is from 25 to 30 years. Age is judged by the incisor teeth.

Cattle.

Half-starved, under-sized, ill-bred, and not unfrequently diseased, the Assamese cattle are but sorry creatures. The bullocks find it a difficult task to drag even the light native plough, and the cows yield but a minimum of milk. The causes of this degeneracy are not entirely clear, but are probably to be found in a total indifference to laws of breeding, in absolute neglect, and partly perhaps in the want of suitable fodder in the rains. Grazing is not very plentiful in Sibsagar, the demand for cattle is considerable, and the price is higher than in Lower Assam. Cows generally cost from Rs.10 to Rs. 18 or even more, and bullocks fetch as a rule between Rs. 20 and Rs. 30.

Goats and sheep and ponies.

The goats are almost as degenerate as the cattle. They yield but little milk, the whole of which is taken by the kids, and are only kept for food or sacrifice. At

night they are usually shut up in a small out-house with a raised floor, which is approached by a slanting board or sloping bamboo platform as a protection against jackals. There is no indigenous breed of sheep, the animals imported do not thrive, and the total number in the district is but small. The country ponies are, if anything, even more miserable specimens than the cattle. Few of them are as much as twelve hands in height, and they possess neither pace, endurance, or stamina. European residents are compelled to obtain their horses fresh from Calcutta. A census of live stock was taken in 1904 and disclosed the following results: Bulls and bullocks 132,000, cows 101,000, bull-buffaloes 25,000 cow-buffaloes 23,000, young stock 164,000, sheep 1,000, and goats 72,000.

The most common forms of cattle disease are foot and mouth disease (*chapka*), rinderpest (*guti*), a disease called *kachua*, the principal symptoms of which are flatulence and diarrhoea (*marki*), cholera, *matikhoa*, the first symptom of which is, as the name implies, the eating of earth followed by dysentery, and *sukuna* when the animal refuses to eat and dies after ten days or a fortnight. A veterinary surgeon, whose headquarters are at Mariani, is entertained by the district Local Boards.

In every district in the Assam Valley there are extensive tracts which are exposed to the floods of the Brahmaputra and its tributaries, but nowhere has the subject of flood protection been a matter of such vital interest as in the *sadr* subdivision of Sibsagar. This is partly due to the fact that the population of the district is beginning to press upon the soil, partly to the fact that

Cattle disease.

Flood protection; work carried out by Ahoms and by British prior to 1901.

the unlimited supply of labour at the disposal of the Ahom Rajas enabled them to protect the farms of the people living in the vicinity of the capital. The floods come not only from the Brahmaputra itself, but from the Dihing, Disang, Dikho and their tributaries. A very complete system of embankments was constructed in the days of native rule. The Dihing, the Dikho, the Disang, and the Dimau and Dirai, two smaller streams which fall into the Disang, were all protected, and there was a large bund along the south bank of the Brahmaputra. For a short time after our assumption of the administration of Assam these bunds were maintained by the District Officer, but, with the disappearance of the system of enforced labour, it was found impossible to keep them in repair. In 1888, the Deputy Commissioner called attention to the damage wrought by flood, and work was begun on the Dihing, Disang, Dikho, and Darika bunds and on the Dhai Ali. The total expenditure on the construction and maintenance of these embankments up to September 1901 was Rs. 1,27,000.

**Work done
since 1902.**

In 1902, the whole question came once more under the consideration of the Administration, and a committee was appointed, who were directed to enquire into the matter and to prepare a scheme for the approval of the Chief Commissioner. Work was begun in 1903-04, and the following was the condition of affairs at the end of 1904. The total expenditure on these works up to the end of December 1904 was about Rs. 3,07,000.

Dikho River.—A bund $15\frac{1}{4}$ miles in length with a top width varying from 12 to 6 feet, had been constructed

along the right bank from the point where the Assam-Bengal Railway crosses the Ramani Ali to the Tax Ali. On the left bank a bund 10 miles long had been constructed from a point about three-quarters of a mile above the place where the railway crosses the river. During the rains of 1904, the Dikho over-topped its banks and more than a quarter of a lakh of rupees was spent during the following cold weather in strengthening the bunds.

Dihing river.—A bund 6 feet wide at the top had been constructed for a length of 44 miles along the left bank to the Shalaguri Ali. The greater part of this embankment lies, however, in the district of Lakhimpur.

Disang river.—A bund 19 miles long, with a top width of from 4 to 6 feet, had been constructed along the left bank of the river from the Shalaguri Ali.

Gosaingaon Suti and Kakila river.—A bund had been constructed along the left bank from Gosaingaon, 5 miles down stream, to Naihatiagaon, and 7 miles up stream to meet the Ladoigarh.

Bhogdoi.—There are bunds on either side of the river which start from about one mile above the point where it is crossed by the trunk road, and terminate about two miles below it.

Reference must now be made to the tea industry which has done so much for the development of Sibsagar. Commence-
ment of tea
industry.

* Information with regard to the early history of the tea industry has been derived from —

(1) Selections from the Records of the Government of Bengal No. XXXVII. Papers relating to tea cultivation in Assam. Calcutta, 1861.

(2) Report of the Commissioners appointed to enquire into the state and prospects of Tea Cultivation in Assam, Cachar and Sylhet. Calcutta, 1868.

(3) Papers regarding Tea Industry in Bengal. Calcutta, 1873.

The indigenous tea of Assam was first brought to the notice of Government in 1826 by Mr. C. A. Bruce, a gentleman who had been engaged in trade in the Province while it was still under native rule, and who had been sent up the Brahmaputra in command of a division of gun boats in 1824. In 1834, a committee was appointed by Government to enquire into the possibility of cultivating tea on a commercial scale, who deputed three of their members, Doctors Wallich, McClelland, and Griffiths, to visit Upper Assam. Nurseries were established, a small establishment was entertained under the general management of Mr. Bruce to search the jungles for plots of indigenous tea and cultivate them when discovered, and plants and seed were brought to Assam from China. Tea-makers and trained Chinese were imported in 1837, and in the following year some of the manufactured product was sent to England and met with a most favourable reception. Assam tea was regarded as a curiosity, and the first eight chests which were put up to auction fetched sums which at the present day seem little short of fabulous, the prices paid ranging from 16 s. to £ 1-14-0 a pound. These were, however, only fancy prices, and a short time afterwards a merchant offered to purchase tea in considerable quantities at prices ranging from 1-10½ d. to 2s. a lb.

**First
beginning in
Sibsagar;**

The first plantation in Sibsagar was situated near Jaipur, and, in 1840, was transferred by Government to the Assam Company. Too much stress was at that time laid on the necessity of cultivating the plant in the

localities in which it was found growing wild in the forests, establishments were maintained on a too lavish scale, and in 1847 shares in the Assam Company, on which £ 20 had been paid up, are said to have been sold for half a crown apiece. Economies were, however, effected in the management, and by 1852 the affairs of the Company had been placed on a more satisfactory footing. In 1859, they had nearly 3,400 acres under cultivation in the district which yielded about 700,000 lbs. of tea, the largest garden being situated at Lingri Pukhuri, which is now amalgamated with Mezenga.

The only other gardens in which at that time any tea was manufactured were Cinnamara, which was owned by Mr. Williamson, Nakachari owned by Mr. Todd, and Neghereting owned by Mr. Spears.*

The two former had been opened in 1854, and the latter in 1853. Twelve other plantations had been opened, but had not yet begun to yield an outturn. Of these four, Bengnakhoa, Oating, Ghiladhari, and Singlo, were owned by Mr. Williamson, while Holongapar and Debrapar were the property of Mr. Todd.†

The total area under cultivation in the district, which at that time was bounded on the west by the Dhansiri, was 5,227 acres with an outturn of 846,000 lbs. of tea.

* It must be borne in mind that at this time a portion of the present Golaghat subdivision was included in Nowgong.

Numaligarh which passed into the hands of the Jorhat Tea Company about this time yielded 48,000 lbs. of tea in 1859, and there was a small outturn obtained from Punkah.

† The expression used in the return is 'planter', but this apparently connotes ownership.

**The boom in
the early
Sixties.**

1859 to 1863 was a period of steady but not abnormal or unwholesome expansion. In the latter year the possibility of making large fortunes out of tea attracted the attention of the speculating classes; and tea planting passed through a severe crisis, which was entirely due to the action of Company promoters, who endeavoured to make money, not by manufacturing tea, but by hastily opening gardens to be sold at most exorbitant prices to the credulous investor. The promulgation of the fee simple rules of 1861, was followed by a rush for land, which was aggravated by the orders of the Board of Revenue, who authorised District Officers to sell estates on a pen and ink sketch made by the applicant, before they had been properly surveyed and demarcated. Land thus obtained was hastily cleared of jungle, a few plants, the majority of which soon died, were hurriedly put out, and the place was sold to the unsuspecting public as a flourishing tea garden. To such a pitch was this procedure carried that there is one case on record in which a manager received instructions from London to clear and plant a certain area of waste land for delivery to a Company to whom it had been already sold as a tea plantation.

**Heavy
mortality in
the Sixties.**

In spite of the high prices offered, local labour was not obtainable in sufficient quantities, and coolies, generally of the most miserable description, were sent up from Calcutta. The mortality in the depôts and on the journey was appalling. In the four years 1864 to 1867, the annual mortality in the largest depôt ranged from 36 to 115 per cent. of the average daily strength; the latter enormous

rate being calculated on a daily average of no less than 458 souls.* Between 1863 and 1868, 54,352 coolies were imported to Assam, 1,712 of whom died *en route*, which is equivalent to a death rate of about 40 per cent. per annum as the journey occupied on the average less than a month. Even when the garden was reached, the mortality was generally high, and was sometimes quite appalling. In the Report of the Commissioners appointed to enquire into the state and prospects of tea cultivation, details are given for seven gardens in Upper Assam, on which the recorded mortality for half the year only in 1865 ranged from 16 to 39 per cent. The returns submitted were declared by the Commissioners to be unsatisfactory, but in 1866, 4,366 deaths were recorded in Upper Assam, which was equivalent to a death rate of 180 per mille on the total number remaining plus the total number of deaths. These days of high mortality have happily now passed away, and in 1902-03, the mortality amongst adult coolies in Sibsagar was only 26 per mille.

During the tea boom large sums were paid for labour and for seed, land which was little better than jungle ^{Collapse in 1866.} was sold for preposterous prices, and the tea companies which were formed under these unfavourable conditions soon collapsed. 1866, 1867, and 1868 were years of great depression. Mr. A. C. Campbell, in a note written in 1873, describes how young men who had been engaged in England, were turned adrift when the collapse came "in a most inhospitable country without a penny or a friend ; some died, others had literally to beg their way

* Report of the Commissioners, p. 28.

out of Assam, most had to regret impaired constitutions, and all the loss of some of the best years of their life." In 1869, affairs began to take a more favourable turn. It was seen that properly managed gardens could be worked at a satisfactory profit and that the estates of the bubble companies which had been bought for small prices after the great crash were doing well in the hands of their new owners. Since 1870, there has been an enormous expansion of the industry, and while the area under cultivation and the outturn have alike increased, the cost of production and the price obtained have steadily diminished. Like other industries, tea has experienced periods of prosperity and depression, but there has been no such boom with its inevitable collapse as occurred in the early sixties.

**Expansion of
the industry.**

In 1872, there were 11,290 acres under mature plant which yielded 3,200,000 lbs. of tea. The corresponding figures ten years later were 35,219 acres of plant and 11,337,000 lbs. of tea. By 1891 the outturn had risen to 20,465,000 lbs. and it continued to increase fairly steadily till in 1900 it was as much as 29,017,000 lbs. The industry was at that time suffering from the effects of over production, recourse was had to a system of finer plucking and the following year saw a decrease in the production of over 2,000,000 lbs. Statistics for later years will be found in Table VII.

**Labour
supply.**

There is hardly any local labour available for employment on the plantations, and coolies have to be brought from the other parts of India. In the ten years ending with 1890 the number so imported was 76,041

and in the following decade it rose to 121,593. The largest number imported in any year was in 1897, when 21,725 persons were brought up to the district.

The abstract in the margin shows the areas from which

The journey from the recruiting districts is trouble- **Labour laws.**
some and expensive, the class of persons capable of working successfully in the damp climate of Assam is limited, and of recent years the supply of labour available has not been sufficient to satisfy the requirements of the planters. Special Acts have been passed to regulate the relations between the employers and their labour force. Careful provision is made for the welfare of the coolie. He is housed in neat and comfortable lines, usually far superior to the dwellings occupied by persons of that class outside the gardens, he is provided with an excellent water supply, generally drawn from masonry wells and tanks, and when sick, he is cared for in a comfortable hospital by a native doctor working under the supervision of a European medical man. The provision of all these comforts and the importation of the labourers themselves cost large sums of money, which no one would be willing to expend without some guarantee that the coolies, when imported,

would consent to remain on the plantation. This protection is afforded by the law (Act VI of 1901) which lays down that a labourer, provided that he is well-treated, must not leave the garden to which he is indentured before the expiry of his contract, unless he chooses to redeem it by a money payment. Act XIII of 1859 is also freely used. Under this Act a labourer who has taken an advance on the understanding that he will complete a piece of work, is liable to imprisonment if he fails to fulfil his contract after he has been ordered to do so by a Magistrate.

**Situation of
tea gardens.**

The tea gardens are scattered all over the central and southern portions of the district. Only a few lie west of the river Dhansiri, and there are none north of the Brahmaputra. The greater number are to be found in a belt of high land stretching along the railway line from the Kamarbund-Ali to the boundary of Lakhimpur.

Further information with regard to the area, site, and population of each garden in the district will be found in Statement A in the Appendix.

Soil.

A friable red loam is the soil that proves most suitable for tea. The plant requires a heavy rainfall, but anything in the shape of water-logging is most prejudicial to its growth, and gardens should only be planted out on land which can be well drained. Land, which in its natural state is covered with tree forest, is usually considered the most suitable, but excellent gardens have also been planted out on ordinary grass land.

Four distinct varieties of wild tea are recognised—^{Varieties of plant.} Assam indigenous, which has a leaf from 6 to $7\frac{3}{4}$ inches in length by $2\frac{3}{8}$ to $2\frac{7}{8}$ inches in width; the Manipur or Burma indigenous with a larger, darker, and coarser leaf than the preceding variety; Lushai or Cachar indigenous, whose mature leaf is from 12 to 14 inches long, and from 6 to $7\frac{1}{2}$ inches wide; and the Naga indigenous, which has a long and narrow leaf. In addition to these four varieties there is the China plant, and different kinds of hybrids. The China tea is a squat and bushy shrub with small leaves, which gives a lower yield per acre than the other kinds. It is many years since China seed was planted out in new clearances, and considerable areas covered by this plant have been abandoned. In its natural state the indigenous plant attains to the dimensions of a tree, varying from 20 to 50 feet in height, though its girth seldom exceeds two feet. It has a vigorous growth and yields a large outturn of fine flavoured tea, but is delicate when young. Of the hybrid variety there are many qualities ranging from nearly pure indigenous to nearly pure China. A plant with a very small admixture of China is usually preferred, as this imparts the hardiness, the want of which is the one defect in the indigenous variety.

Seed from the Singlo, Barzeloni, and Taokak gardens is generally considered to be of exceptionally good quality. The price varies largely in accordance with the demand, and of recent years has ranged from Rs.150 a maund in 1897 to Rs.40 a maund in 1903.

**System of
cultivation.**

The seed is planted in nursery beds in December and January and kept under shade till the young plants are three or four inches above the ground.* Transplanting goes on during May and June if six months old plants are put out, but as this involves keeping a clearance hoed during the rains, some managers prefer putting out their clearances with one year old plants in December and January, the plants being usually placed from four to five feet apart. During the first two years of their life, little more is required than to keep the plantation clear of weeds. By this time the plants are from two to four feet high, and at the end of the rains they are pruned down to fifteen inches or a foot to encourage lateral growth, and sometimes even lower. In the third year the plants can be lightly plucked over, but the yield of leaf is small. Pruning is continued every year, only about two inches are left of the wood formed since the previous pruning, and any unhealthy or stunted branches are removed. As an extreme remedy, old plants, in which there is a large proportion of gnarled and twisted wood, are sawn off level with the ground, and fresh shoots are allowed to spring from the root itself. During the rains the garden is hoed over 7 or 8 times, in order to render the soil permeable to rain water and to keep down the jungle. At the end of the rains the ground is hoed up to the depth of 8 or 9 inches. The object of this is to protect the land from drought, as the hoed up soil prevents the evaporation of water from the lower strata, and to kill the weeds

* Some managers only shade the plants in unusually dry seasons.

It also adds to the fertility of the land by exposing it to air, light, and changes in temperature. Of recent years various manures have been coming into use. Oil cake and cowdung are sometimes spread about the plants, and exhausted land is occasionally top-dressed with rich soil from a neighbouring marsh. The cost of these operations is considerable and they are not invariably successful from the pecuniary point of view.

Plucking begins in March and April and is continued till the beginning of December. The bud and the two top leaves are taken from each shoot, but fresh leaves soon appear, and in about five weeks' time the shoot is ready to be plucked again. This throwing out of new leaves is termed a "flush," and there are usually six or seven full flushes, in a season; though each bush is picked over every ten days or so, as the twigs develop at different times. The plucking is usually done by women and children, while the men are engaged in hoeing up the ground around the plants. The plant is liable to be attacked by a large number of pests, the best known being the tea mosquito or blight, the green fly, and the red spider. A full account of these pests will be found in "The Pests and Blights of the Tea Plant" by Watt and Mann, Calcutta, 1903.

When the leaf has been taken to the factory, it is spread out in thin layers on trays or *changs* and allowed to wither. In fine weather the process takes about 16 to 18 hours, but if it is cold and wet, 24 to 30 hours may elapse before the leaf is ready. When the leaf has

System of
manufac-
ture.

been properly withered it is placed in the rolling machines. The object of rolling is to break up the cellular matter and liberate the juices, and to give a twist to the leaf.

Rolling takes from 30 to 45 minutes, and after this the leaf is placed in a cool room for from $1\frac{1}{2}$ to 4 hours to ferment. It is then placed on trays in the firing machines, through which hot air is driven, until the last trace of moisture has been expelled, and the tea is crisp to the touch. The leaf is then passed through sieves of varying degrees of fineness, and the tea sorted into different grades. The best and most expensive quality is called broken orange pekoe, and is made from the bud or tip, which contains all the good qualities of tea in a more concentrated form than any of the other leaves, is stronger, and has a more delicate flavour. The other grades, which are differentiated by the size of the mesh through which they pass, are orange pekoe, broken pekoe, pekoe, souchong, and fannings. After the tea has been sorted it is fired once more to remove any moisture it may have absorbed from the surrounding atmosphere, and is packed in lead-lined boxes while it is still warm. Tea loses largely in weight during the process of manufacture, and about four pounds of green leaf are required to produce one pound of the finished article.

Green tea.

Of recent years an attempt has been made to introduce the manufacture of green tea in order to meet the demands of the American market. In 1902, the Indian

Tea Association offered a bounty of $1\frac{1}{2}$ annas on every pound of green tea manufactured. The following year this bounty was reduced by half, and nearly 15,000 lbs. of green tea were exported from Sibsagar. The principal difference between the manufacture of green and black tea is that the former article is not fermented. As soon as the leaf comes in it is steamed in a drum for about half a minute, a process which turns it a bright green colour, and effectually stops all fermentation. Excess moisture is then removed by a hydro-extractor or centrifugal machine, and it is then rolled, fired, and sorted into the following different grades, Pinhead gunpowder, Gun powder, Young Hyson, Hyson No. I, Hyson No. II, Twanky and Dust. The infused leaf should be of a bright green colour, and the liquor of a very pale yellow shade. Most of this tea is sent to North America, but a small quantity is sold in the midland counties of England.

The character of the outturn depends largely upon the season, but still more upon the garden and the system of manufacture followed. In 1868, the Commissioners estimated that the average outturn was about 240 lbs. per acre, but this estimate was probably too low as the average yield in Sibsagar during the five years ending with 1903 was 375 lbs. per acre. The introduction of machinery, and the improvement of the general system of cultivation and management, have rendered it possible to effect a large reduction in the cost of the tea when placed upon the market. In 1868, it was calculated that

**Outturn and
prices.**

tea must be sold at 2s. a lb. to yield a profit. Twenty years later the average price obtained by tea from the Brahmaputra Valley was 8 annas 2 pies, and though in 1894 it rose to 10 annas 5 pies, in 1898 it dropped to 6 annas 9 pies and, except in 1902, has since remained below that figure.

Forests.

The forests of Sibsagar fall into two main classes, the reserved forests, which in 1902-03 covered an area of 876 square miles, and the unclassified state forests, which in the same year occupied the enormous area of 2,839 square miles. Unclassed state forest is, however, simply Government waste land and does not necessarily possess any of the characteristics which are usually associated with the expression forest. It may be a sandy chur, or a huge expanse of low-lying land covered with high grass and reeds and almost totally destitute of trees. It may be a small piece of arable land which has been resigned by its former holder and has not yet been settled with any other person, or it may be, what its name would naturally suggest, *i.e.*, actual tree forest. A considerable proportion of the unclassified state forests of the district are situated in the Mikir Hills, where they are *ghumed* over by the Mikirs.

**System of
manage-
ment.**

The management of the reserved forests is generally entrusted to a Deputy or Assistant Conservator, but the unclassified state forests are under the immediate control of the local revenue officials. Royalty is realized on forest produce removed for purposes of trade, but the villagers are allowed to take from unclassified state forests all that is needed for their own requirements free of royalty.

The statement annexed to this chapter gives, in a condensed form, details with regard to the situation, area, trade routes, and market centres for each of the reserved forests in the district, which cover an area of more than ten square miles. These reserves consist of dense evergreen forest and as yet have only been partially explored. There is one small forest at Holongapar near Jorhat, and four in the east of the Sibsagar subdivision ; but more than seven-eighths of the total area is situated in the Mikir Hills and the valleys of the Dhansir and the Doiang, where the Nambar and the adjoining reserves form a compact mass covering over 600 square miles of territory. Since the completion of the Assam-Bengal Railway some attempt has been made to exploit the resources of these forests. Nahor (*mesua ferrea*) found in close proximity to the railway line has been converted into sleepers. A saw mill has been established at Bokajan, which cuts up simul and other soft wood for tea boxes, and nahor, ajhar, and other hard varieties for sleepers and scantlings ; but the trade in timber is not yet of much importance. Table VIII shows the receipts obtained from each reserve. The only forests from which any appreciable quantity of revenue is at present obtained are the Nambar, the Disai, and the Disai valley, and the latter is actually situated in the Naga Hills. The reserves of Golaghat, exclusive of the Nambar, cover an area of 393 square miles, but during the three years ending with 1902-03 they produced an average gross revenue of less than Rs. 500 per annum. There is a second saw mill in the district situated at Garamur, but it

Situation of
the reserves
and revenue
they yield.

obtains most of its timber from unclassified state forests.

**Rates of
royalty and
most
valuable
timber tree.**

For timber required for sale royalty is paid at the rate of Rs.6 for each reserved tree or 4 annas a cubic foot whichever is less, while for unreserved trees the rate is one anna a cubic foot with a maximum of Rs. 2 for the tree. The most valuable timber trees in the district, all of which fall in the category of reserved trees, are nahor (*mesua ferrea*), ajhar (*lagerstrœmia flos reginæ*), uriam (*bischoffia javanica*), titasapa (*michelia champaca*), sam (*artocarpus chaplasha*), poma (*cedrela toona*), gunserai (*cinnamomum glanduliferum*), amari (*amoora spectabilis*), gomari (*gmelina arborea*), paroli (*stereospermum chelonoides*), khakan (*duahanga soneratioides*) and koroï (*albizzia procera*). The most important second class trees are simul (*bombax malabaricum*), hollock (*terminalia bicolorata*), hollong (*dipterocarpus bondii*), hingori (*castanopsis rufescens*) and hillika (*terminalia citrina*). Large logs are generally dragged by elephants to the nearest river and floated down to the place where they are required. Building timber, scantlings, and sleepers are frequently sawn up in the forest and thence conveyed by coolies to the nearest cart road. Agar (*aquilaria agalocha*) is found in small quantities in the forests bordering on the Naga Hills. Cane is found both there and on the Majuli, but the receipts under this head are comparatively small. The principal source of forest revenue in the district is the royalty paid by traders. Details with regard to the receipts and expenditure of the department will be found in Table IX.

List of reserved forests covering an area of ten square miles or more.

Name of reserve.	Situation and character of soil.	Area in square miles.	Date of constitution.	Names of valuable timber trees.	Routes of extraction.
Mikir Hills ...	North central portion of the Mikir Hills. Hilly and rocky. Soil, sandy loam.	81	1873	Nahor, Gunserai, Amari, Poma, Titasapa, Am and Hillika.	Not worked at present. The Kaliani river might perhaps be used.
Kaliani ...	North-east portion of the Mikir Hills on both sides of the Kaliani river. Hilly and rocky. Soil, sandy loam.	81	1887	Nahor, Paroli, Sam, Hillika, Hollock, Am Hingori, and Bhela.	Kaliani river to Numaligarh.
Nambar ...	On both sides of the Dhansiri river, between Mikir Hills and Naga Hills. Plains and low hills. Soil, principally a sandy loam.	387	1878	Nahor, Ajhar, Uriam, Titasapa, Sam, Poma, Gunserai, Amari, Gomari, Paroli, Khan, Koro, Hollock, and Hollong.	Assam-Bengal Railway which passes through forest.
Diphu ...	Between the Diphu and Dhansiri rivers and Bokajan. Plains undulating in places. Soil, sandy loam.	66	1887	Ajhar, Uriam, and Hollock.	Diphu and Dhansiri rivers to the Assam-Bengal Railway near Bokajan.
Rengma ...	Right bank of the Rengma river at the foot of the Naga Hills. Slightly undulating plains. Soil, sandy loam.	66	1887	Ajhar, Uriam, and Hollock.	Down the Rengma and Doiang rivers to Jamuguri.

Doiang ...	Between the Doiang river and the Naga Hills. Plains slightly undulating in parts. Soil, sandy loam.	95	1888	Ajhar, Uriam, Hollock and a little Nahor.	The Golaghat Wokha road and the Doiang and Kakadanga rivers to Golaghat or Mokrong.
Disai ...	On the right bank of the Disai river at the foot of the Naga Hills. Low hills. Soil, sandy loam.	11	1883	Nahor, Ajhar, Titasapa, Sam, Poma, Gunserai, Amari, Khakan, Hollock, Hollong and Hingori.	The Disai river and the Mokochung road to the Assam-Bengal Railway line.
Abhaipur ...	Between the Safrai and Taokak rivers at the foot of the Naga Hills. Northern portion level, rest low hills. Soil, sandy loam.	26	1881	Ajhar, Nahor, Sam, Uriam and Poma.	The Safrai river to the Assam-Bengal Railway.
Panidithing ...	On the right bank of the Dimau river. Plains. Soil, loam and clay.	30	1894	Ajhar, only valuable tree found in any quantity.	Dimau and Disang rivers to the Brahmaputra.
Diroi ...	On the left bank of the Diroi river. Plains. Soil, loam and clay.	18	1881	Nahor and Ajhar	Diroi and Disang rivers to the Brahmaputra.

CHAPTER V. INDUSTRIES.

Arts and manufactures—Pat silk—Muga—Eri silk—Weaving—
Pottery—Brass and bell-metal—Mat-making—The fishing industry—Jewellery.

Apart from tea, the industries of Sibsagar are not of much importance. They include the rearing of the lac insect and of silk worms, the manufacture of rough earthenware and metal vessels and jewellery, with mat-making and weaving.

Three different kinds of silk are produced in the district. The most valuable kind is known as *pas* and is obtained from the cocoon of two species of worms, the univoltine or *bar polu* (*bombyx textor*) and the multi-voltine or *horu polu* (*bombyx cræsi*). Both kinds are reared in-doors, on the leaves of the mulberry tree (*morus indica*). The eggs of the *bar polu* take ten months to hatch, the worms usually making their appearance about the beginning of January. The life of the worm lasts from thirty to forty days, and the cocoon takes about six days to spin. The cocoons are of a bright yellow colour, but the silk, when boiled in potash water, becomes perfectly white. From twelve to fifteen thousand cocoons are required to yield one pound of thread, which is worth from Rs. 8 to Rs. 12. The thread obtained from the *horu polu* is not so valuable as that of the *bombyx textor*, but as the worm yields four broods in the

year it finds greater favour with the cultivators. *Pat* silk is as a rule only made to order, and the total quantity produced is small. From 250 lbs. to 350 lbs. of this silk are said to be produced in the Marabazar and Salaguri mauzas of the Namtidol tahsil. The costliness of the silk is due to several causes. The worms are very delicate, the period of incubation is a long one, and the amount of thread obtained from each cocoon is small. The supply of mulberry leaves is limited, and the feeding of the worms in-doors entails some trouble. Lastly the *pat* worm is looked upon as impure, and its cultivation is restricted to the lowly Katanis. They in their turn are naturally not disposed to extend an industry which in itself is an indication of the humble position of its followers.

Muga.

The *muga* worm (*antheræa assamæa*) is generally fed on the *sum* tree (*machilus odoratissima*). Five different broods are distinguished by vernacular names, but in the Sibsagar district the only broods commonly reared are the *katia* in October-November, the *jarua* in December-February and the *jethua* in the spring. The complete cycle of the insect lasts from 54 to 81 days, the bulk of which is occupied by the life of the worm. When the moths hatch out the females are at once attached to straws which are hung up inside the house, and are visited by the males, who are allowed to remain free. Each female produces about 250 eggs, which are generally placed in a dark place, and when the worms appear they are at once transferred to the *sum* tree. A band of straw or plantain leaves is fastened round the trunk to prevent

them from descending, and during the night they take shelter under the leaves. Constant vigilance is, however, required to keep off crows, kites, owls, large bats and other pests which prey upon the worm, and hail and heavy rain not unfrequently do damage. When fully grown the worm is about 5 inches long and nearly as thick as the forefinger. In colour it is green, with a brown and yellow stripe extending down each side, while red moles with bright gold bases are dotted about the surface of the body. When the worms are ready to spin, they descend the tree, and are then removed to the house and placed on bunches of withered leaves. Large quantities of *muga* silk are produced in Sibsagar, and *muga* silk cloths form the holiday attire of practically all, and the every-day dress of a very large number of the village women. The worm is reared in every part of the district, but the silk produced is generally required for home use and is not offered for sale. The villages on either side of the Jhanzi river and the Naharani mauza in Golaghat are especially noted for the production of this silk. The silk is reeled from the cocoon. The price obtained varies from four to six annas per oz.

The *eri* worm (*attacus ricini*) derives its name from the *Eri silk*. *eri* or castor oil plant (*ricinus communis*), on which it is usually fed. From five to six broods are usually reared in the year ; those which spin their cocoons in November, February, and May yielding most silk. As with the *muga* moth, the females, when they emerge, are tied to pieces of reed, and are visited by the males, who are left at liberty. The eggs are hatched in the house and take

from a week to 15 days to mature. As soon as the worms appear they are placed on a tray, which is suspended in a place of safety, and fed on the leaves of the castor oil plant. When fully grown, they are about $3\frac{1}{2}$ inches long and of a dirty white or green colour. After the final moulting, the worms are transferred from the tray to forked twigs suspended across a piece of reed, and, when they are ready to spin, are placed on a bundle of dried plantain leaves or withered branches which is hung from the roof of the hut. The matrix of the cocoon is very gummy, and the silk, which is of a dirty white colour, has to be spun, not reeled off. Before this is done the cocoons are softened by boiling them in water and a solution of alkali. Empty cocoons yield about three quarters of their weight in thread. The *eri* industry is not as important in Sibsagar as it is in Lower Assam, owing to the extensive cultivation of the *muga* worm, and comparatively little *eri* cloth is produced for sale. The worm is not considered impure by any caste except the Brahmins.

**Cost of Silk
cloths.**

The most useful garment made of *eri* silk is the *bar kapor*, a large sheet sometimes as much as 20 feet in length by 5 feet wide, which is folded and used as a wrap in the cold weather. It costs from Rs. 10 to Rs. 16. *Eri* cloth is also made into coats and petticoats. Women's clothes, both petticoats and the shawls worn over the bust, are however usually made of *muga* silk, the thread required for a complete dress costing from Rs. 5 to Rs. 7. Some of the articles made of *pat* silk are very beautifully embroidered, and a woman's dress in this

material may cost as much as Rs. 180. The instruments used for twisting and weaving silk are the same as those employed for cotton, but for *eri* thread a stronger reed is employed.

The earth used is generally a glutinous clay, which is **Pottery** well moistened with water and freed from all extraneous substances. If it is too stiff some clean coarse sand is worked up with it. A well kneaded lump of clay is then placed on the wheel, which is fixed horizontally and made to rotate rapidly. As the wheel revolves, the potter works the clay with his fingers and gives it the desired shape. The vessel is then sun dried, placed in a mould, and beaten into final shape with a mallet, a smooth stone being held the while against the inner surface. It is then again sun dried, the surface is polished, and it is ready for the kiln. The collection of the clay and firewood, the shaping of the utensils on the wheel, and the stacking of them in the kiln form the men's portion of the work. The women do the polishing and the final shaping. The Hiras, however, do not use the wheel, but mould the vessel on a board, laying on the clay in strips, and the whole of this work is entrusted to the women.

The instruments employed are—the wheel (*chak*), which is about three feet in diameter and rotates on a piece of hard pointed wood fixed firmly in the ground, moulds (*athali*) of different sizes, the mallet (*baliya piteni*), and the polisher (*chaki*).

The principal articles manufactured are cooking pots (*charu*), cups (*mola*), water jars (*kalah*, *takeli* and *thali*), and

larger vessels (*hari*), with lamps, pipes and drums. The profits of the business are said to be small, and the local pottery is being gradually ousted by a superior quality of goods imported from Bengal and by metal utensils which are coming extensively into use. The principal centres of the industry are at various *kumargaos* or "potters" villages in the Teok, Salmara, Hezari and Garamur mauzas in the Jorhat subdivision; at Golaghat; and in the Dhekial, Dergaon, Athgaon, Rangamati and Gurjogania mauzas in the Golaghat subdivision.

Brass and
Bell-metal.

The brass and metal industry is not of much importance. Its principal centres are in the Namdayang and Dopdar mauzas in the *sadr* subdivision; in the Salmara, Titabar, Charaibahi and Kakajan mauzas in Jorhat; and in the Kacharihat mauza and Golaghat town in the Golaghat subdivision. The number of people supported by the industry is small, and in Jorhat, at any rate, it is said that it is only practised as a subsidiary occupation to agriculture. Bell-metal utensils are usually cast in moulds, but brass vessels are made out of thin sheets of that metal, which are beaten out and pieced together. The implements of the trade consist of anvils of different sizes (*belmuri chatuli*), hammers, pincers, and chisels. The furnace is simply a hollow in the floor of the hut, and the bellows are made of goat's skin. When it is desired to join two sheets of brass together, nicks are cut in one edge, into which the other edge is fitted, and the two are then beaten flat. A rough paste made of *pan*, a substance which consists of three parts of sheet brass with one part of solder, and borax is then smeared over the

join. The metal is heated, the *pan* melts, and the union is complete. The principal articles manufactured are small flattish bowls often used as drinking cups (*lota*, *bati*), jars for holding water (*kalah*, *gagari*), trays (*sarai*), boxes to carry betelnut and lime (*tema*, *temi*) and large vessels used for boiling rice (*jaka*).

The weaving of cotton cloths in the villages is still **Weaving.** very generally carried on, but there are signs of a gradual tendency to wear imported fabrics, which are fairly cheap and save the women trouble. Though cotton is grown in the hills of the Province, and though many different dyes are to be found growing in its forests, the material employed is almost invariably imported yarn, which is obtained in the requisite shades from the village shop. The loom consists of four stout posts which are driven into the ground so as to make a rectangle about 5' 10" $\times$ 2' 6", and are joined together at the top by cross beams. The implements required for the conversion of raw cotton into cloth, and the system of manufacture followed, are described in the minutest detail in a "Monograph on the Cotton Fabrics of Assam" published by the Superintendent of Government Printing at Calcutta in 1897. Descriptions of mechanical processes of this nature are, however, at their best unsatisfactory, and are hardly intelligible without a series of diagrams. Those curious on the subject would do well to consult this monograph, in which the whole subject is discussed with an elaboration and detail which would be quite unsuitable in a gazetteer. The total cost of the whole apparatus is about ten rupees,

and, as weaving only occupies the leisure moments of the women, the use of home made clothing helps to save the pocket of the villager. Very little cotton cloth is prepared for sale, and there can be little doubt that weaving, as an industry, is commercially a failure ; the price obtained for the finished article being out of all proportion to the time expended on its production. The principal articles made are large sheets or shawls worn as wraps, called *chadar* or *bar kapor*, and smaller shawls, called *chelengs*. A kind of shawl called *paridia kapor* is very finely made and is enriched with a beautifully embroidered border. It costs sometimes as much as Rs. 200. The clothing of the women is almost always made at home and consists of a plain petticoat *mekhla* and a species of scarf *riha* worn over the bust. These garments are, however, often made of silk.

Mats.

Mats are of three kinds : *dhari* which are made from strips of *jati* bamboo, *patis* which are made of the *patidoia* reed (*maranta dichotoma*), and *katn* which are made of *gogul* and *mutha* (*cyperus rotundus*). *Patís* are generally made by Ahoms and a section of the Kewats who are called *Patíyas* and are considered to be slightly inferior to the other members of the caste. They are smooth and cool, and are sometimes boiled in a solution of potash to give them a light blue appearance. They are generally made in the Bakata mauza in the Sibsagar subdivision, the Salmara and Hezari mauzas in Jorhat, and the Ahata-guri mauza in the Golaghat subdivision, and cost from As. 6 to As. 12. *Dharis* are manufactured in most parts of the

district and are very cheap. *Kath* mats are made on the Majuli and cost three or four annas each. Other articles of wickerwork manufactured by the villagers are sieves (*salonis*), baskets in which clothes are kept (*jopa*), other baskets (*pasi*), winnowing fans (*kula*), large receptacles for storing grain (*dhuli*), and hats (*jhapi*). These hats are made of the *tokow* leaf (*livistonia jenkinsiana*) on a framework of split bamboo, and are often decorated with coloured pompons and strips of cloth. They are generally about two feet in diameter, but if intended to be used as sun shades for priests or ladies, they may be as much as five feet in diameter. Decorated *jhapis* are known as *sarudoia* and are generally worn either by Muhammadan women or by Nadiyals and Brittal-Baniyas. The ordinary *jhapi* for common use is known as *khorua*, but women sometimes wear a kind called *ruidengia* which is made of pieces of split bamboo. In the Namtidol tahsil there is a section of the Chutiya caste whose principal occupation is *jhapi* making, and who are called in consequence *jhapihajia*, and the same name is applied to a section of the Ahoms in the Jorhat subdivision. The best hats are made in the Jhapihajia village in the Dopdar mauza, another village of the same name in the Lahing mauza, and the Mahimelia village in the Ghiladhari mauza.

The fishing industry is of considerable importance in Sibsagar. Every villager catches fish for his own use, but fishing on a commercial scale is restricted to the Nadiyals. Of these there were 23,000 in 1901, all of whom

The fishing industry.

are to a certain extent supported by the produce of their nets, though probably only about one-third are fishermen pure and simple. The right of fishing the more important rivers and *bils* is every year put up to auction, and, in 1902-03, fetched no less a sum than Rs. 35,500. Figures for subsequent years will be found in Table XIV.

The auction purchaser, who is almost invariably a Nadiyal, makes his own arrangements with the fishermen. In the case of *bils* it is said that he takes three-fourths or four-fifths of the fish, when the catch is large, but only one-half when the *bil* is becoming exhausted. In the case of rivers he assesses a certain amount on each of the fishing villages along the bank. The most important fisheries, after the Brahmaputra, are in the Sibsagar subdivision, the Darika river, the Dilih, Garijan, the Jaradhara Rangapani, the Napukhri and Bhatiapar tanks, and the Mitang *bil*. In Jorhat they are the Dilbili, Kakadanga, and Kakila rivers, the Molow, Padumoni, and Raboi *bils*, the Kakohikata *bil*, the Teok Taptapi, and the Kharupatiajan. In Golaghat the Dhansiri river and the Mihi Kaluma and Gela *bils* bring in a considerable revenue. There is no trade in dried or salt fish, but fresh fish is sent from the Brahmaputra down the Jorhat State Railway into the interior.

Nets used.

The following are the nets most commonly in use: (1) *Ghakata*, a net in the shape of a shovel which is pushed through the water and is generally used to catch *butchua* fish. (2) *Khewali* a piece of netting to the centre of which a rope is attached while all round the edges there

are weights. The net is thrown flat on to the surface of the water, when the weights sink and drag the sides of the net together. It is then drawn by the rope to a boat or bank. The following names are applied to this net as the mesh decreases in size, *sayani*, *pachani*, *afalia*, *angtha*, and *ghanjal*. (3) *Langi*, a large net which is stretched right across a river, the bottom being weighted and the top buoyed. The fish are then driven toward^s the net and become entangled in its meshes. The *tenga langi* is a smaller variety, the two ends of which are brought round to form a circle as the net is not long enough to reach across the river. (4) *Parangi*, a square net the opposite corners of which are fastened to flexible bamboos. The net thus hangs like a sack from a stout pole to which the bamboos are attached and is lowered into the water and raised at intervals. Various wickerwork traps are also used. The *polo* resembles a gigantic wine glass with a short stem made of wickerwork. It is generally used by women, who walk through shallow water and keep pressing the rim on the mud at the bottom. Any fish that are caught are removed through an opening at the top. The *juluki* is a smaller kind of *polo*. The *jakai* is a species of wickerwork shovel which, like the *polo*, is generally used by women. They place the broad end of the shovel on the ground before them, and trample up the mud so as to drive the small fry into it. Conical bamboo traps which are called *dingaru*, *thupa*, *sepa*, and *gui* and are worked on the principle of the lobster pot, are placed in small streams or running water near the rice fields.

**Jewellery
and lac.**

Jorhat is noted for its jewellery and enamelling. The ornaments are generally made of thin gold leaf and enamel set with cheap rubies and emeralds. The jewellery of Jorhat is described at length in a Monograph on the Gold and Silver Wares of Assam, published at the Shillong Secretariat Press in 1905. Lac is raised by the Mikirs in the hills, but the total quantity exported from the district is said to be very small.

CHAPTER VI.

ECONOMIC CONDITION OF THE PEOPLE,
COMMUNICATIONS, TRADE, TOWNS AND LOCAL
BOARDS.

Rents—Wages—Prices—Food and dress—Dwellings—Economic condition of the people—Conventional restrictions—Communications—Development of steam navigation—Railways—Roads—Rivers—Post and telegraph offices—Commerce and trade—Markets—Towns—Local Boards.

From the statement in the margin it will be seen that **Rents.**

Group.	Percentage of settled area sublet.	less than 7 per cent of the

Western Golaghat, and Central and Southern Jorhat, but is insignificant in Central Golaghat and Eastern and North-Western Sibsagar. The rents exacted are usually in cash and not in kind, and the rate charged very frequently does not exceed the Government revenue on the land, the owner deriving his profit from the assistance which the tenant is required by custom to afford him in cultivating the fields which he retains under his own management. The highest rates charged are those in Central Jorhat, which is the most densely populated portion of the district, where landlords generally ask and

obtain about Rs. 2 a *bigha*. Even here only 6 per cent of the total area settled at full rates is sublet, and the great mass of the tenants are either garden coolies who supplement their earnings from labour by cultivation, or landholders who have not sufficient land of their own to meet their wants.

Produce rents are of two kinds. In one case the landlord takes half the crop, in the other he takes a certain fixed amount irrespective of the total yield. Where the latter system is in force the amount taken is generally equivalent to a cash rent of from Rs. 2 to Rs. 2-8 per *bigha*.

There was a considerable increase in the number of tenants at the last census, the number, including their dependants, having risen from 9,900 in 1891 to 21,500 in 1901. A considerable proportion of these persons are, however, Assamese who occupy the land held by the great *sattras* at privileged rates, and whose position does not materially differ from that of the ordinary raiyat. There are in fact no signs at present of the growth of a landless class or of there being any danger of rack renting. Coolies who are still working on a tea garden are willing to pay more or less fancy rents for land in the vicinity, but this slight enhancement of the rent is of little importance in comparison with the profits they obtain from hiring out their labour in their leisure hours. Low land on tea estates is generally leased out by garden managers to their coolies, as the possession of a small area of rice land helps to keep the labour force contented and attaches them to the garden.

In spite of the existence of a considerable number of **Wages.** ex-garden coolies who are not debarred from working by any social considerations, labour is said to be difficult to procure. The ordinary wage asked is four annas a day, but ploughmen are usually paid in kind, and are either given the crop from one *higha* of land for every twelve they plough or allowed the use of their employer's bullocks on their own farm for one day out of three. Most of these labourers are ex-garden coolies or poor Ahoms and Chutiyas, though in some places Assamese from Kamrup come up in search of work. Assamese occasionally work on the roads for the Public Works Department, provided that the work is at some little distance from their homes, but they are unpunctual and dilatory and seldom stay for long. Hired labour is often employed for getting in the rice crop, and none but the gentry regard such work as involving any loss of social status: Kalita women may, in fact, be seen cutting the rice of a fisherman or Nadiyal. Servants are paid from Rs. 2 to Rs. 9 per mensem, but the ordinary rate is Rs. 4 or Rs. 5 with food. Artizans are very scarce, and when procurable command high wages.

Table X shows the price of rice, salt, and pulse as re- **Prices.** corded at the markets of Sibsagar, Jorhat, and Golaghat. Rice and pulse have risen in price during the last quarter of a century, while salt has been growing cheaper.

In a rural area like Sibsagar the question of price is of more importance to those who sell than to those who buy, and the undoubted prosperity of the district is to some extent due to the fairly high prices which the

villagers generally obtain. It is, however, difficult to ascertain these prices with any degree of certainty as the *dun*, which is the unit of measure, is a basket which may contain from $3\frac{1}{2}$ to $3\frac{3}{4}$ seers of unhusked rice. Near Jorhat unhusked rice generally sells at the rate of six *duns* or 21 seers for the rupee. In less accessible parts the price seems to range from 7 to 9 *duns*, or from $24\frac{1}{2}$ to $31\frac{1}{2}$ seers per rupee. Where the raiyats in the western portion of the district have taken advances, as much as 15 *duns* or $52\frac{1}{2}$ seers are taken by the traders for a rupee. Mustard generally sells at the rate of from $12\frac{1}{2}$ to 15 seers per rupee. The price of molasses is subject to sharp variations. Up to 1902, it had stood fairly steady at between Rs. 4 and Rs. 5 per maund. It fell in that year to Rs. 2-8, but in 1903 was up again to Rs. 5.

**Food and
dress.**

The staple food of the people is boiled rice, eaten with pulse, spices, and fish or vegetable curry. Amongst the well-to-do, pigeon or duck occasionally take the place of fish, but fish is a very common article of diet, and is said to be a substitute for *ghi*, which is not very largely used. Goat's flesh is eaten by Muhammadans and members of the Saktist sect, and venison is always acceptable, but is not easily procurable in the central and more densely populated portions of the district. Tea drinking is very common, especially in the early morning. Sweetmeats usually consist of powdered grain mixed with milk, sugar and *ghi*. The ordinary form of dress for a villager is a cotton *dhoti* or waistcloth, with a big shawl or wrapper and sometimes a cotton coat or waistcoat. Women wear a petticoat, a *riha* or scarf tied round the bust, and a shawl.

These clothes are still very often made at home, and in the case of the women, and of the large wraps worn in the cold weather by men, are frequently of silk. Sibsagar is, in fact, the great centre of *muga* cultivation, and most well-to-do women wear a *muga riha* as an article of every day attire, and many don a silk petticoat as well. Foreigners wear cheap imported cotton cloths and blankets and ready made coats, and the use of these articles of clothing is spreading amongst the Assamese. This change is hardly for the better, as the cheap cloths of Manchester are not so artistic or durable as the products of the native loom, and it is doubtful whether the time that was formerly spent on weaving is now employed on any profitable occupation. The *jhapi* or national hat of the Assamese has already been described in detail. Boots and shoes are the exception, and in their own homes even well-to-do people wear wooden clogs. Wooden sandals are also used by villagers when travelling or working in jungle ground, where there are tufts of sharp pointed grass. Reference has been already made to the jewellery manufactured near Jorhat. The extent to which it is worn is a clear index of the prosperity of the district.

The homestead of the ordinary peasant is generally separated from the village path by a ditch or bank on which there is often a fence of split bamboo. Inside there is a patch of beaten earth which is always kept well swept and clean. Round this tiny courtyard stand two or three small houses, almost huts, and in a corner there are generally two open sheds, one of which

Dwellings.

contains a loom, while the other serves the purpose of a cow-house. The whole premises are surrounded by a dense grove of bamboos, plantains, and areca nut trees, and there are often numerous specimens of the arum family covering the ground. The general effect is picturesque enough, but the presence of all these plants and trees makes the whole place very damp and excludes all sun and air. At the back there is generally a garden in which vegetables, tobacco, and other plants are grown. The houses are small, dark, and ill-ventilated, and must be very hot in summer. They are built on low mud plinths, and are thus extremely damp. The walls are made of reeds plastered with mud, or of split bamboo, the roof of thatch, the rafters and the posts of bamboo.

The houses of the middle class are built on practically the same plan, but they are larger, and wooden posts and beams are often used in place of bamboo, while roofs of corrugated iron are sometimes to be seen. The furniture of the ordinary cultivator is very simple, and consists of a few boxes, wickerwork stools and baskets, brass and bell-metal utensils, and bottles and earthen pots and pans. His bedding is a quilt made out of old cloths, and he either sleeps on a mat on the damp floor or on a small bamboo *machan* or platform. The well-to-do have beds, tables, and chairs in their houses, but these articles of luxury are seldom found outside the towns. This style of house is common to all the Assamese, but in the flooded tracts there are none of the graceful areca palms, as the tree cannot thrive if the

roots remain long under water. These orchards and gardens are a considerable source of wealth to the cultivator, and a house standing on a bare patch of ground has always a somewhat poverty stricken appearance to eyes accustomed to the luxuriant vegetation in which the typical Assamese cottage is embedded. The Miris on the Majuli build their houses on platforms to raise them above the level of the floods, and the village site is practically bare. The prosperity of the Assamese in Sibsagar is indicated by the comfortable appearance of their houses. There are probably few places in Assam where building materials would be more expensive, as there is little Government forest in the more densely settled tracts and jungle-wood posts, thatching grass, and cane have often to be brought from a considerable distance. But the people realize that a comfortable home is conducive to their personal well-being, and are willing to expend the time and labour which its erection and maintenance entails. Ex-garden coolies build, as a rule, small and uncomfortable cottages.

The Settlement Officer is of opinion that the condition of the people only partly depends upon the fertility of the soil. The best homesteads and a fairly high standard of comfort are frequently found where the land is unfertile, and the material condition of the people is, he thinks, largely a question of their habits. Villagers who consume great quantities of opium and rice-beer are obviously not likely to be well endowed with this world's goods. The purchase or preparation of these luxuries entails a heavy drain on their resources

Economic condition of the people satisfactory on the whole.

and a man besotted with beer or opium is hardly likely to make an energetic or a careful cultivator. There are several very fertile villages in the east of the Ghiladhari mauza, in the centre of Khumtai, and in Dihingia in which the condition of the people is unsatisfactory. This, the Settlement Officer reported, was due to their own laziness, and to their indulgence in opium and rice-beer, and far from proposing any abatement of taxation, he suggested a slight enhancement, in the hope that it might stimulate them to make a proper use of their advantages. This view is corroborated by the condition of the people near Jorhat itself. The land is far from fertile, the immense mass of the cultivators subsist on the produce of their gardens and of one crop, transplanted paddy, yet nowhere in Assam will be seen more comfortable homesteads or more prosperous villagers.

**Indebted-
ness.**

Most of the local revenue officers consulted report that a considerable proportion of the raiyats are in debt, but the Settlement Officer does not consider that indebtedness has as yet assumed serious dimensions. Money is usually borrowed to defray the expenses of litigation, or of a marriage or *srauth* ceremony, to purchase cattle, or as a temporary measure to meet the land revenue demand. The rates of interest are usually high, and range from 24 to 75 per cent per annum, the higher rates being charged on loans of small sums for short periods. The creditor is, however, often a fellow villager, and in these cases it is doubtful whether the nominal rate of interest is exacted.

The tea industry is the principal source of the prosperity of the people. The total amount disbursed as wages to the garden coolies in 1903-04 was no less than 48 lakhs of rupees ; and a considerable proportion of this enormous sum must find its way into the pockets of the villagers in return for the products of their farms and gardens. Silk clothing and handsome jewellery are common wear in most portions of the district, and there can be no question that an energetic and industrious cultivator is sufficiently well off. The sale of surplus paddy is the principal source from which the villagers obtain the money they require. Other sources of income are mustard, pulse, molasses, poultry, fruit and vegetables, and the sale of thatching grass, bamboos, fuel, and of *eri* and *muga* cloth and thread. In the west of the district the people sometimes hollow out canoes or prepare mats for sale, and the Mikirs raise cotton, lac, and chillies. Assamese occasionally take contracts for the building of huts and outhouses for the Public Works Department; and Bengalis work on roads, and still more often on the gardens to which they were previously indentured.

Sources
from which
people
obtain
money.

There is probably no surer test of the so-called civilization of a people than the extent to which it has succeeded in freeing itself from conventional and meaningless restrictions. It is only natural, therefore, that in a remote and, till recently, inaccessible Province like Assam, the daily life of the villagers should be surrounded by strange tabus of different kinds. From one of the greatest of the curses of Indian life they at any rate are

Conventional
restrictions.

free, and the purdah is a thing that exists in little more than name. The womenfolk of the ordinary well-to-do cultivator would as soon think of interning themselves within the four walls of the house as would a farmer's wife at Home, though when appearing in public, at a railway station or a steamer ghat, they might perhaps discreetly veil their faces, at any rate before a European. Apart from the ordinary restrictions of caste, which need not be referred to here, it is days that seem to be the principal stumbling block to the villagers of Assam. No one ever enjoys making payment of the Government dues, but to the Assamese this process, for reasons which are not quite clear, is especially objectionable on a Monday or a Wednesday. All over the district the villagers avoid these days, but in the Amguri mauza they take exception to Thursdays, and Saturdays as well; while, in the Athgaon tahsil, Friday is thought an inauspicious day on which to pay the revenue. Seed is not generally sown on a Tuesday or a Saturday, or the day of the new moon, and the full moon, and the eleventh day after either of these events. Mustard (*shoriya*) must not be sown on any lunar day beginning with an *s*, or pulse (*muh*) on any day beginning with an *m*. The following list of forbidden days from the Nahorani mauza recalls the *fasti* and *nefasti* days of the old legal calendar so vehemently denounced by Cicero. Paddy, pulse, and mustard can only be sown on Mondays and Wednesdays, and if either of those two days happens to fall between the 7th and 10th of the lunar month in the case of pulse, and the 11th and 14th in the case of mustard, they at

once are barred. Revenue should only be paid on Sundays, Tuesdays, and Thursdays. On Saturday you must not cut thatching grass or bamboos, or even your own hair, on Monday you must not thatch your house, on Tuesday you must not put earth on the floor or cut bamboos or your own hair. Similar restrictions are found in every part of the district, though it is not everywhere that they are observed so carefully.

At the time when we first came into possession of the Province, the difficulty of communications proved a most serious obstacle to its development. The Brahmaputra was the great highway which connected this portion of the Company's dominions with Bengal, but the journey up the river for any boat of ordinary size was a very lengthy business. McCosh, writing in 1837, stated that a large boat took from six to seven weeks to come from Calcutta to Gauhati, though the post, which was conveyed in small canoes rowed by two men, who were relieved every fifteen or twenty miles, reached Gauhati in ten days and Bishnath in three days more.* From Gauhati to Dibrugarh it was a month's journey for a "pinnacle," even in the cold weather; † and in the rains against the current the journey took much longer.

Few people presumably had sufficient time or patience to undertake the voyage at that season of the year. Week after week the weary traveller must have pursued his

* Topography of Assam, pages 9 and 82.

† Report on the Province of Assam by A. J. Moffatt Mills, Calcutta, 1854, paragraph 82. Butler in his sketch of Assam puts the journey from Calcutta to Saikhoa in a badgerow *via* Dacca at over nine weeks even in the cold weather.

tedious way, his view bounded, as a rule, by high banks of treacherous sand, which then, as now, were continually being undermined by the current, and falling with a crash into the water. It was only occasionally that he could relieve the monotony of the voyage by a stroll on shore, as through the greater part of its course down the valley the banks of the river are covered with high reeds and grass, which are quite impenetrable to a man on foot ; and the tedium of this dreary voyage of fully three months' duration must have been immense. Canoes, of course, could travel faster against the current, but a canoe is not a vessel in which the ordinary man can journey for many days in comfort.

**Beginning
of steam
navigation.**

This was the state of things for twenty-two years after our annexation of the valley, but in 1848, the Government steamers were deputed to ply between Calcutta and Gauhati. Three years later, the Commissioner, Major Jenkins, made the not unreasonable proposal that three or four times a year they should be allowed to proceed right up the valley to Dibrugarh. His suggestions were negatived by the Marine Department on the ground that the voyages would be financially a failure ; but his views were strongly urged on Government by Mr. Mills when he visited the Province in 1853. The proposal met with the approval of the Lieutenant-Governor, instructions were issued for the despatch of a steamer in that year, and several voyages were made with results that were not unsatisfactory, even from the financial point of view. The journey from Gauhati to Dibrugarh and back occupied no more than fifteen days, an extraordinary con-

trast to the interminable delay of the same voyage in a country boat. The cargo tendered soon exceeded the carrying capacity of the steamers; and in 1855, Lieutenant-Colonel Jenkins complained that the vessels reached Gauhati fully laden with goods shipped in Upper Assam, so that Gauhati and the ports below derived practically no advantage from the downward service of the steamers.

As was only to be expected, the rates at first charged were fairly high, and a ticket from Calcutta to Gauhati cost no less than Rs. 150. On the other hand, the accommodation was designed on an extremely liberal scale, as the regulations issued in 1851 expressly authorized passengers to carry pianos in their cabins free of freight, provided that they were required for use during the voyage and were not in packing cases; a proviso which suggests a very deliberate voyage as compared with the speedier travelling of the twentieth century. Freight on ordinary stores seems to have been charged at the rate of one rupee per cubic foot between Calcutta and Gauhati; but for some time longer a great part of the trade of the Province continued to go by country boat. The planters could never count on being able to despatch their tea by steamer, and were thus compelled to keep up an establishment of country boats, and having got the boats to use them, and the same objection held good in the case of native merchants.* The cost of working the line was heavy, but in spite of this, it showed a fair

* Memorandum by the Director of Public Instruction, Bengal, dated the 7th February 1857.

profit, and it was evident that there would be a great development of the traffic if only facilities were provided for it.

**Private
steamers put
on the river.**

In 1860, the India General Steam Navigation Company entered into a contract to run a pair of vessels every six weeks, provided that the Government boats were taken from the line; and since that date the steam navigation of the Assam Valley has been in the hands of this Company, and the River Steam Navigation Company, with whom they are associated. But in spite of the existence of a regular service, and the quickening effects of private enterprise, travelling still continued to be very slow. The steamers did not profess to run to scheduled time, the delay at the larger ports for the loading and unloading of cargo was considerable, and the passenger no doubt often required his piano to beguile the tedium of the way. In 1861, the Commissioner, Colonel Hopkinson, was disposed to take a gloomy view of the condition of affairs; and in a letter to Government openly gave expression to the opinion that it would be better to compensate the planters for any loss they might sustain, and abandon the Province, unless Government were prepared to enter upon a course of vigorous material improvement. In the same letter, he drew the following dreary picture of the isolation of Assam:—

“With the furious current of the Brahmaputra, still unconquered by steam, opposing a barrier to all access from without, and not a single road fit for wheeled carriage, or even passable at all for a great portion of the year, there is such an absence of the full tide of life running through Assam, such a want of intercourse between man and man, as does and must result in apathy, stagna-

tion and torpidity, and a terrible sense of isolation, by which enterprise is chilled and capital and adventurers scared away. The profits of tea cultivation should attract hundreds where tens now come, but the capitalist is not always to be found who will venture his money in a country to which access is so difficult as it is to Assam, through which his correspondence travels at the rate of a mile and a half an hour, and in which it may take a month to accomplish a journey of two or three hundred miles; nor on the other hand is it every spirit, however bold, that cares to encounter so dreary a banishment, and to be so entirely cut off from his fellows in a place from which exit is only possible at rare intervals, and must be so literally a prison or tomb to him."

Matters, however, gradually improved, and in 1884, a daily service of mail steamers was started between Dibrugarh and Dhubri, connecting with a steamer which plied between the latter place and Jatrapur. Here the traveller who was pressed for time could take the train to Calcutta, though the line was not of the most comfortable, as more than one river had to be crossed in boats before the capital of Bengal was reached. The introduction of a daily steamer service represented an enormous advance in the facilities for communication between Assam and the outer world. The large steamers were not uncomfortable, but progress was slow, and not only the hour but the date on which they left any given port was far from certain. The would-be traveller could not choose his own time for starting on his journey, but had to select a date on which a steamer was expected at the nearest ghat; and even then he not unfrequently had to endure a weary period of waiting by the river bank. The daily service changed all that, and combined the advantages of regularity with a speed which, in comparison with that attained by the large cargo boats, was most

commendable. During the rains Dibrugarh was reached on the fifth day after leaving Dhubri, while the downward journey was performed in three days. The navigation of the river is not entirely free from difficulty, the companies were not incited to further efforts by competition, and some years elapsed before any attempt was made to reduce the duration of the voyage. On the completion of the Assam-Bengal Railway, the companies realized that it was necessary to accelerate their timing if they were to retain their traffic; and during the rains, steamers now reach Dibrugarh on the fourth day from Dhubri, while the voyage from Dibrugarh to Goalundo only occupies three days, though in the cold weather the journey takes a day longer.

A service of fast steamers also plies between Dibrugarh and Calcutta *via* the Sundarbans, by which goods can be sent direct without any necessity for handling. Sibsagar possesses a long river frontage and has numerous ports. The steamers call at Dhansirimukh, Neghereting for Golaghat, Kakilamukh for Jorhat, Kamalabari on the north bank, Dikhomukh, Disangmukh for Sibsagar, and Dihingmukh.

**The Rail-
way.**

A glance at the map will show that, whatever may have been the condition of affairs half a century ago, Sibsagar is well supplied with the means of communication at the present day. Along the north runs the Brahmaputra with its excellent steamer service, along the south there is the Assam-Bengal Railway, and the two are connected by the Jorhat State

Railway which runs from Kakilamukh past Jorhat town to Mariani and Titabar. The main line of the Assam-Bengal Railway, which extends from Chittagong to Tinsukia, enters the district about $3\frac{1}{2}$ miles west of Dimapur. From there it runs in a north-easterly direction up the valley of the Dhansiri to the Kamarbandh Ali station about six miles east of Golaghat. It then trends more to the east and runs along the south of the district till it finally enters Lakhimpur beyond Bhojo station. The total length of the Railway in Sibsagar is 152 miles, and the stations going from west to east are Dimapur, Bokajan, Barpathar, Jamaguri, Furkating, Kamarbandh Ali, Titabar, Hilikha, Mariani, Nokachari, Seleng, Amguri, Namtiali, Nazira, Dhodar Ali, Lakwa, Safrai, Bhojo, Sapekhati, and Namrup. By the completion of this railway in 1904 the district has been connected by rail with Gauhati, Dibrugarh, and the seaport of Chittagong. Jorhat, which is situated about the centre of the district, is 137 miles by rail from Dibrugarh, 227 miles from Gauhati, and 482 miles from Chittagong. The most noticeable effect produced by the opening of the line was the diversion of the Naga Hills and Manipur traffic from the Neghereting-Dimapur road to the railway. Travellers and goods for either of these two places had formerly to proceed by steamer to Neghereting, and from this place there was a tedious march of 75 miles to Dimapur. This is now a thing of the past, and Dimapur is only $12\frac{1}{4}$ hours' journey from Gauhati.

The Jorhat State Railway is on a gauge of 2 feet, and was completed in 1885 at a cost of Rs.4,73,000. It runs

from a terminus on the Brahmaputra, which is shifted from time to time to meet the exigencies of that changing river, past Jorhat to Cinnamara, where it divides into two branches, one of which goes to Titabar and the other to Mariani.* The total length of the line including the two branches is 30 miles.

Roads.

For internal traffic Sibsagar is well supplied with roads, and, leaving out of account the private roads maintained by tea gardens, there were altogether in 1904 942 miles of road within the district. This allows of one linear mile of road for every five square miles of area, a proportion which is moderate enough, but this figure is, as figures often are, misleading. Amongst the sparsely peopled Mikir Hills and in the valley of the Dhansiri there are practically no roads, and in the Majuli, which is much exposed to flood, there is only a section of the North Lakhimpur-Kamalabari road some ten miles in length. In addition to these regular main roads there are a considerable number of village tracks, over which the raiyats are able to cart their dhan in the cold weather, and, generally speaking, the inhabitants of the Sibsagar plain are well supplied with the means of communication.

The trunk road.

The principal road in Sibsagar is the section of the south trunk road which traverses the whole length of the valley from Fakirganj to Sadiya. It enters the district about three quarters of a mile east of Bagori and runs between the Mikir Hills and the swamp that fringes the Brahmaputra as far as the river Dhansiri. East of the

* The Mariani branch was not opened till 1887.

Dhansiri, the road trends a little towards the south, and tea and rice fields take the place of forest, hill, and marsh. After crossing the Jhanzi, the road, following the configuration of the district, turns towards the north, and after passing through Sibsagar enters Lakhimpur on the further side of the Dihing river. The road is of considerable width, and over the greater part of its length is raised well above the level of the highest floods. All the minor streams and rivers are bridged, but the Dhansiri, Jhanzi, Dikho, Disang, and Dihing have to be crossed on ferries at all seasons of the year, and the Diphu in the rains. The total length of the road in Sibsagar is 116 miles. There are inspection bungalows at the following places: the length of the stage in miles going from west to east is shown in brackets after the name:—Kaziranga (11) Bokakhat (10), Kamargaon ($10\frac{1}{2}$), Badlipar (7), Dergaon (8), Kakadanga (5), Jorhat (11), Kakojan (10), Jhanzi (9), Gaurisagar (8), Sibsagar ($7\frac{3}{4}$), and Dimu (12).

After the trunk road probably the most important thoroughfare in the district is the Dhodar Ali which takes off from the trunk road at Kamargaon and runs south-east to Golaghat. Here it turns to the east and passes right along the south of the district into Lakhimpur, a total distance of 119 miles. There are inspection bungalows along the road at Titabar, Mariani, Char Ali, Tenga-pukri, Sonari, Sepakati, and Dillih.

Other important roads in the Golaghat subdivision are the road between the Brahmaputra at Neghereting and Golaghat, and the road from Golaghat to Wokha garden, whence a bridle path runs to Wokha in the Naga Hills.

The road from Golaghat to Dimapur used formerly to carry all the traffic for the Naga Hills and Manipur, but since the completion of the Assam-Bengal Railway it has ceased to be of any importance, as there is no local traffic. In the south of the subdivision a road runs east from Wokha garden to the Kakadanga. But these are only the main thoroughfares, and so well is this portion of the district provided with the means of communication that in Central Golaghat there is not a single village which is more than three miles distant from a road.

The Jorhat roads.

In Jorhat there is a very complete system of roads, which, starting from the town as a centre, run to various points on the Dhodar Ali. On the west there is the Kamarbandh Ali, then comes the Na Ali which crosses the Dhodar Ali and is extended through the south of the Amguri mauza to the Kakadanga. The Garh Ali runs at a little distance from and parallel to the Na Ali to Titabar, but throws off a branch at Cinnamara which goes to Mariani. Further east again is the Ladoigarh road, which runs from a point near the Brahmaputra in a south-easterly direction to the Jhanzi.

This is, however, but a skeleton outline of the system of Jorhat. Any attempt to describe the minor roads in detail would be alike tedious and confusing.

The Sibsagar roads.

Sibsagar *sadr* is also well supplied with roads, most of which are a legacy from the days of native rule. The *paik* system provided the Ahom Rajas with an unlimited supply of labour, which was freely utilized in the excavation of enormous tanks and the construction of high embanked roads. The trunk road runs through the

northern section of the subdivision, the Dhodar Ali near the hills towards the south, and between them and parallel to them run the Sologuri and Rajgarh Alis. But besides these there are many other roads, the most important of which is perhaps the road from Nazira to Disangmukh.

During the last quarter of a century the roads of the district seem to have been much improved. Sir W. W. Hunter, in his statistical account of Sibsagar, published as late as 1879, wrote as follows :—

Improve-
ment of the
roads during
the last 25
years.

"Owing to the numerous small streams which intersect the country, and the frail bamboo bridges which last only for a short time, most of the roads are impassable during the rains. The general mode of transit when the country is dry, is by elephants or coolies; no bullock carts are used by the people of the district, but wheeled conveyances have lately been introduced by some of the planters, and found to answer remarkably well. The only drawback to a more extensive use of the cart or waggon is the want of good bridges on the main road, and the few small branch roads."

This would be a very misleading description of the condition of affairs in Sibsagar at the present day. Ferries there are, no doubt, but the proportion is for Assam unusually small. There is not a single ferry on any important road in the Jorhat subdivision or in Golaghat east of the Dhansiri, except across the rivers in the flooded tract between the trunk road and the Neghereting steamer ghat. The bridges are no longer frail structures of bamboo, but are generally made of iron girders supported on strong wooden posts. Bridge building has, in fact been carried to such lengths that no less than Rs.67,000 were expended by the Jorhat Local Board in bridging the Disai where it crosses the Dhodar Ali. Hired coolies

are nowadays hardly ever used as a means of transport, and, according to a census taken in 1904, there were no less than 3,700 carts plying in Sibsagar. Round Jorhat the roads are very sandy and remain in comparatively fair order even during the rains, but in other parts of the district they are much cut up if used to carry heavy traffic in the rains. The roads to the steamer ghats are the ones that suffer most, and in wet weather the roads from Disangmukh to Sibsagar and from Neghereting to Golaghat become almost impassable.

Rivers.

The rivers in the district are also used for purposes of commerce. A boat of four tons burthen can proceed up the Disang as far as the Dillih ghat in the rains, and the Mohmara ghat in the cold weather, and small feeder steamers occasionally visit the latter station when the river is full, to fetch away the tea manufactured by the Singlo Tea Company. Country boats in the rains go right up the Dikho to Santak, but in the cold weather a boat of four tons burthen can hardly get as far as Nazira. Boats also go up the Jhanzi and the Kakadanga in the rains, but in the cold weather these rivers are too shallow to be much used.

In July and August a feeder steamer runs up the Dhansiri to Golaghat once or twice a week, and a boat of four tons burthen can make this station even in the cold weather. In the rains it can get as far as Dimapur, but traffic on the Dhansiri as on the other rivers in the district has been much affected by the opening of the Assam-Bengal Railway. The Ahoms seem to have been expert boat builders, they possessed a numerous and powerful

fleet, and a separate section of the people was entrusted with the duty of providing the king with boats and keeping them in proper order. All of this special knowledge has unfortunately been lost. The only boats manufactured by the natives of the district are canoes hollowed with fire and adze out of logs of wood, and such planked boats as there are, are imported from Bengal.

The following statement shows what an enormous **Post and telegraph offices.** development there has been of postal business since 1875. A list of the places at which post and telegraph offices are situated, will be found in the appendix.

Number of post offices in		Number of letters and post cards omitting thousands delivered in			Number of Savings Bank accounts in	Balance at the credit of the depositors in.
1875	1903-04	1861-62	1870-71	1903-04	1903-04	1903-04
13	52	18	62	793	1,372	Rs. 5,08,000

The Assamese have no commercial aptitude, and the natives of Sibsagar have allowed the whole of the profits **Commerce and trade: imports.** of the wholesale and of a large portion of the retail trade to be absorbed by foreigners. The principal men of business are the Kaiyas, the astute Marwari merchants whose shops are to be found on every tea garden, at the three headquarters towns, and wherever else there is money to be made. They are practically the sole importers of the district, and bring up from Calcutta piece-goods, clothes and blankets, grain and pulse of various kinds, salt, oil, *ghi*, iron, cement, corrugated iron, umbrellas, and thread.

Centres of trade.

The chief centres of trade are the three small towns of Sibsagar, Jorhat, and Golaghat; Nazira, the headquarters of the Assam Tea Company; and Dimapur which is the depôt for the trade of the Naga Hills and Manipur.

None of these places are, however, of much importance, and the opening of the Assam-Bengal Railway is said to have diminished what little trade there used to be in Sibsagar and Jorhat. There is nothing in the conditions of the district to conduce to the formation of small towns. There are no arts or industries to draw the people together, and the overwhelming importance of the agricultural interest has a decentralizing effect on trade. On every tea garden there is a Kaiya's shop, and Kaiyas' shops are scattered about the villages to buy up the surplus dhan, and sell piece-goods, salt, oil, tobacco, and yarn to the peasants. But so scattered are they that there are only about sixty places in the district which have as many as three shops or more. The names of these places will be found in a statement in the Appendix.

Exports.

Apart from tea, which is shipped direct to Calcutta, the principal articles produced within the district are dhan and mustard. Surplus dhan is either sold by the cultivator to the coolie, who buys it in the villages or at the local market, or to a middle man in the shape of a Kaiya or Muhammadan trader. Mustard is bought either by the Kaiya, the local oilman or *teli*, or by the Ramdiyals from Kamrup who come up in the rains with their boats and ship it to Gauhati. The Kaiyas also purchase a certain quantity of *muga* silk, and, on the Majuli, cane; but the bulk of their profit is derived from sales, and

they have not that lucrative trade with the hill tribes which contributes so much to their prosperity north of the Brahmaputra.

A great deal of business is, however, transacted at the **Markets**. local markets, which, for the convenience of the coolies, who are the purchasing section of the community, are usually held upon a Sunday. Here the villagers bring their surplus dhan or rice, fruit and vegetables, molasses, goats and poultry ; and the traders come with grain of various kinds, piece-goods, tobacco, salt, oil, and the various other articles which form their stock. Ready made clothing is on sale, and all the other little articles of cheap haberdashery which are likely to catch the coolie's eye and appeal to his untutored taste. A list of these bazars will be found in the Appendix. The largest and most important are probably those held at Dhojder and Titabar. There is not much trade with the hillmen except in cotton which is brought down by the Lhota Nagas to Golaghat ; but between 30,000 and 40,000 maunds of Manipuri rice have of recent years been brought annually to Dimapur. Most of the external trade of the district is still carried by the steamers plying on the Brahmaputra, though a portion of it will now no doubt be transferred to the Assam-Bengal Railway by which it can be conveyed direct without handling to the sea at Chittagong. The principal exports are tea, which in 1903 was probably, even at wholesale prices in Calcutta, worth not far short of £ 800,000, silk cloths, mustard, cotton, and hides.

**Municipal.
Sibsagar.**

The small town of Sibsagar has been constituted a station under Act V, B. C. of 1876, and its affairs are managed by a committee, three of whom are officials and hold their seats by virtue of their office, while the remaining seven are nominated by the Chief Commissioner. The principal sources of income are a grant from Government, fees from markets and pounds, and a tax assessed at the rate of 4 annas per mensem per 100 square feet of shop sites, and of 4 per cent on the annual value of other buildings. The total income of the station in 1901 was under Rs.12,000, but the population of Sibsagar in that year was only 5,712. The civil station is built on the edge of the magnificent tank to which reference has been already made, and the native quarter lies between it and the Dikho. The total area of the town is 2.94 square miles, which is served by 17 miles of road, 4 $\frac{1}{4}$ miles of which are metalled. Drinking water is obtained from the Sibsagar tank, from two smaller tanks which have been excavated by the Commissioners, from three masonry wells, and from the Dikho river. The view of the tank with its fringe of trees, and the Hindu temples, public offices, and bungalows dotted along the bank is picturesque enough, but the rest of the town is little more than a prosperous village. There is comparatively little trade, and had it not been the headquarters of the district the place would have been of very small importance. Even this source of importance it is losing, as the transfer of the headquarters of the district to Jorhat has recently (1905) been sanctioned.

Jorhat, the headquarters of the subdivision of that **Jorhat.** name, is situated on the left bank of the Bhogdai river. The little town only covers an area of .64 of a square mile and had a population in 1901 of 2,899 souls, but it has been formed into a union under Act V, B. C. of 1876. There are five Commissioners who are nominated by the Chief Commissioner. The Subdivisional Officer acts as Chairman and takes an active part in the management of municipal affairs. The total income, excluding the opening balance in 1901, was only Rs. 6,500, Rs. 2,000 of which were provided by the Local Administration. There are ten miles of road within the town, but only half a mile is metalled. Most of the public buildings are situated within the earthen ramparts of an old Assamese fort, which was erected at the time of the Moamaria insurrection towards the end of the eighteenth century. There is a little tank within this fort, on the banks of which the cutchery, the residence of the Subdivisional Officer, and one or two other public buildings have been erected. The town is connected by rail with the Brahmaputra at Kakilamukh, and the Assam-Bengal Railway at Mariani and Titabar, and is the centre of some trade.

Golaghat is also a union under Act V, B. C. of 1876, **Golaghat.** but it is even less populous than Jorhat, as there were only 2,359 inhabitants at the last census. The town covers an area of .78 of a square mile and contains 13 miles of unmetalled and half a mile of metalled road. As in Jorhat, there are five Commissioners nominated by

Government, but the management of the town vests to a great extent in the Subdivisional Officer. The total income in 1900-01 excluding the opening balance amounted to about Rs.6,000, one-fourth of which was provided by the Local Administration. The bazar is situated on the right bank of the Dhansiri, and is the depôt to which the Lhota Nagas bring their cotton.

There are no other towns in the district, and no places of sufficient importance to merit detailed description. An account of each village was prepared at the last settlement, but these accounts have not been considered to be worth printing even in connection with the settlement proceedings.

**Local
Boards.**

In the early days of British Administration there was little money available for public works of any kind, and what there was was generally expended under the control of the Public Works Department or the District Magistrate.

In 1872, the management of the district roads was entrusted to a committee presided over by the Deputy Commissioner. The funds at their disposal were partly obtained from tolls and ferries on local roads and other miscellaneous sources, but principally from grants made by the Bengal Government from the amalgamated district road fund. In 1874, when Assam was erected into a separate Administration, the Government of India assigned one-seventeenth of the net land revenue for local purposes. The district improvement fund was then started, and the administration of its resources was as before entrusted to the Deputy Commissioner assisted

by a committee. The actual amount placed at their disposal was not large, and in 1875-76 the total income of the district funds of the Province was only Rs.1,85,000, which was a small sum in comparison with the twelve and a half lakhs of rupees received by the Local Boards in 1903-04. In 1879, a Regulation was passed, providing for the levy of a local rate, and the appointment of a committee in each district to control the expenditure on roads, primary education, and the district post. Three years later the district committees were abolished by executive order, and their place was taken by boards established in each subdivision, which are the local authorities in existence at the present-day. The Deputy Commissioner is Chairman of the board of the headquarters subdivision, but each of the other boards in the district is presided over by the Subdivisional Officer. The Local Boards are entrusted with the maintenance of all roads within their jurisdiction, except a few main lines of communication, the provision and maintenance of local staging bungalows and dispensaries, and the supervision of village sanitation, vaccination, and the district post. They are also in charge of primary education, subject to the general control of the Education Department, and are empowered to make grants-in-aid to schools of higher grade, subject to certain rules. For these purposes they have placed at their disposal the rate which is levied under the Assam Local Rates Regulation of 1879, at the rate of one anna per rupee on the annual value of lands, as well as the surplus income of pounds and ferries, and some minor

receipts. This income is supplemented by an annual grant from Provincial Funds. The principal heads of income and expenditure are shown in Table XVII.

The annual budgets of the boards are submitted to the Commissioner for sanction. The estimates for all works costing Rs.500 or over must be submitted to the Public Works Department for approval, and important works, requiring much professional skill, are made over for execution to that department. Less important works are entrusted to the board surveyors.

•

CHAPTER VII.

GENERAL ADMINISTRATION.

Native system of land revenue—Early settlements—The settlement of 1893—The Settlement of 1902—Growth of land revenue—Established and fluctuating cultivation—Annual and periodic leases—Settlement staff—Land tenures—Mauzas and tahsils—Realization of land revenue—Unsettled waste—Excise—Income tax—Stamps—Public works—Government—Criminal and Civil Justice—Registration—Police—Military Police—Volunteers—Jail—Education—Medical—Survey.

The system in force under the Ahom kings was one of personal service. The whole of the adult male population was divided into bodies of three men called *gots*, each individual being styled a *paik*. In theory one *paik* out of the three was always engaged on labour for the State, and while so employed was supported by the remaining members of his *got*. In return for his labour each *paik* was allowed 8 *bighas** of *rupit* land, and the land occupied by his house and garden, which is now called *busti*, free of revenue. Any land taken up in excess of this amount was assessed at 4 annas a *bigha*. In addition to this each adult *paik* paid a poll tax of one rupee.

At the time when the district was under the management of Purandar Singh the poll tax was raised to Rs. 3 per *paik*, but on the resumption of his territories in 1838 the country was measured up and the revenue

* One area = 3.025 *bighas*.

assessed upon the land itself and not upon its occupants. The revenue at first taken was only 4 annas per *bigha* for *rupit*, or land growing transplanted rice, and 2 annas a *bigha* on all other kinds of land. In 1844 the rate on *rupit* was raised by one anna a *bigha*, and in 1849 the rate on other land was raised to 3 annas 6 pies, but this very moderate enhancement was accompanied by a concession to the gentry of the district. There could be no question that the upper and middle classes amongst the Assamese had suffered severely from the emancipation of their slaves and the abolition of their privileges, and as a measure of relief the curious concession subsequently described as 'ten twenties' was sanctioned by the Government. Persons who paid Rs.20 or more in revenue were assessed at only half the usual rates, and people paying anything between Rs.20 and Rs.10 were assessed at Rs 10 only.*

**Hopkinson's
settlement.**

In 1865, the Commissioner, Lieutenant-Colonel Hopkinson, proposed to discriminate between *basti* or garden and other land and to raise the *bigha* rates in Assam Proper to Re. 1 per *basti*, 10 annas for *rupit*, and 8 annas for other land. No detailed enquiries were made, there was no attempt to estimate the comparative value of the three different classes of land, there was no discrimination between good and bad land in the same class, or even between district and district. It was argued that the revised rates were so moderate that they would not have an oppressive incidence even on the worst land on which they were imposed. Colonel Hopkinson declared that the

* *Vide* Mille's report on Assam.

existing assessment was ridiculously low, and in support of his opinion pointed out that in 1864-65 the receipts from opium were about four lakhs of rupees more than the total land revenue of his division, an excess which in those days represented a difference of about 40 per cent. The new assessment was successfully introduced in 1868-69, and in spite of the enormous enhancement the revenue was collected without difficulty.

The next settlement was made in 1893. The three-fold division of land was retained, but instead of imposing the same rate on all land of the same class throughout the district, the villages were divided into four grades and the rates assessed varied with the grade of the village*. The villages were provisionally graded by the Director of Land Records and Agriculture, the class in which each village was placed being determined by the demand for land, and not by any intrinsic considerations of the value of the produce, the fertility of the soil, or the profits of cultivation. The demand for land was estimated by ascertaining the density of the population, the proportion of settled to unsettled land, and the proportion of fluctuating cultivation. These lists were sent to local officers for examination and were modified by them in view of the fertility of

The settle-
ment of 1893.

* The following were the rates assessed per *bigha* :—

Class.			Bastl.	Kupit.	Faringati.
			Rs. a.	Rs. a.	Rs. a.
1st	...	...	1 6	1 0	0 12
2nd	...	...	1 4	0 14	0 10
3rd	...	...	1 2	0 12	0 9
4th	...	...	1 0	0 10	0 8

the soil, the facilities for bringing the produce to market, and the rents paid by sub-tenants where ascertainable. This enquiry was carried out by the ordinary district staff within the space of a single cold weather, and the results obtained made no pretensions to scientific accuracy. Such accuracy was considered to be unnecessary, as it was not intended to impose anything like the maximum assessment on the land. The Government had no desire to assess up to its fair share of the value of produce of the soil, and under these circumstances it was contended that it would be waste of time and money to have recourse to any minute and elaborate classification of the soils, to crop experiments on a large scale, or to a close examination of all the elements that affect the net profits of the cultivator. The theory on which the settlement was based was that the worst lands were capable of bearing the assessment imposed, and that Government alone was a loser by its inequalities.

**The settle-
ment of 1902.
The soil unit.**

The resettlement which was begun at the close of 1902 was carried out in a much more elaborate and scientific manner than any of its predecessors. While the maps and records were being brought up to date, the Settlement Officer made detailed enquiries with the object of ascertaining the classes into which the land could be most suitably divided, and the relative value to be allotted to each class. The unit of settlement was what is known as the soil unit. Each soil unit pays a certain quantity of revenue, the actual sum assessed per soil unit varying with the village. To every *bigha* of land is

assigned a certain number of soil units, the number varying with the class of land concerned. Thus in every *bigha* of *bhal bari*, or first class homestead land, there were 24 soil units, whereas in every *bigha* of badly flooded land there were only 4, and whatever revenue might be assessed on badly flooded land in the village, first class homestead land, if there was any, paid six times as much. The data used when determining the number of soil units to be allotted to each class of land were (1) the local enquiries of the Settlement Officer and his Assistants, (2) experiments made with the view of ascertaining the average quality of the crop, (3) the opinions expressed by certain selected persons, and (4) the views of the raiyats who were assembled at various centres. Considerable weight was attached to the opinions of the raiyats, as it was thought that they at any rate should know the comparative value of the different kinds of land they held. It will be seen that the process of differentiation was carried much further at the new settlement than at the one which preceded it. In 1893, the maximum rate per *bigha* in a village could never be more than double the minimum. In 1903, the maximum rate might be six times the minimum. In 1893, all land in the village followed the class of the village. In 1903, there was no such restriction, and a small area of poor land in an otherwise rich village could be assessed on its own merits.

After the maps and records had been brought up to date a special staff was deputed to determine the class into which each field or homestead fell. The total

Value
assigned to
each soil
unit at the
new settle-
ment.

number of soil units in the block, or group of several mauzas into which for re-assessment purposes the district was divided, was then ascertained*, and the former revenue of the block divided by this figure. The quotient represented the incidence of revenue per soil unit under the former settlement and was known as the *unit incidence*.

The next stage in the proceedings was the determination of the new *unit rate*, the rate which was to be assessed on each soil unit during the current settlement.

The Settlement Officer first decided whether he would raise or lower the unit rate for the block as a whole, and took as his standard in assessing villages the unit rate he had fixed on for the block. This was the rate imposed on the average village, while villages above or below the average had the rate raised or lowered in proportion to the extent to which they seemed to differ from the mean.

The general condition of the inhabitants, the prices they could obtain for their produce, and the facilities for trade which they enjoyed, were the principal factors taken into consideration when determining the value to be assigned to the soil unit of the village.

**Classes of
land.**

Land in Sibsagar was divided into 13 different classes. Homestead or *bari*, was classified in three grades, good (*bhal bari*), average (*bari*), and poor (*takula bari*). Land fit for the growth of transplanted rice (*rupit*) was distributed under four main heads, *charanpara* or land enriched

* The area falling under each class was known and all that was required was to multiply the number of *bighas* in each class by the number of soil units in the class.

by the drainage of the village site, *alatiya*, or clay loam, *balichehiya* or sandy land, and *jalatak* or land liable to flood. Each of these four classes was again divided into *da* or low and *bam* or high land. Except in the case of the flooded class, *da* land is naturally the more valuable of the two. Two other classes were *chechukiya* or shaded lands, and *faringati* which embraced all land which was neither *bari* nor *rupit*.

The following statement shows the number of soil units assigned to each class of land:—

BARI.			RUPIT.								Chchukiya. Faringati.	
Bhal bari.	Bari.	Tukala bari.	Charan- para.		Alatiya.		Balichehiya.		Jalatak.			
			Da.	Bam.	Da.	Bam.	Da.	Bam.	Da.	Bam.		
24	18	9	21	13	16	9	12	7	4	12	6	6

The revenue payable by a soil unit differed in the different villages and varied from nine pie to two annas. These arrangements did not, however, hold good in the case of areas where fluctuating cultivation is the rule, such as the Majuli and the marshes along the south bank of the Brahmaputra. One rate was here imposed on all land in a block which was not either good homestead or *rupit* land.

**Growth of
the land
revenue.**

The statement in the margin shows the gradual expansion of the land revenue and the settled area since the district first came under our administration. The enormous expansion of the settled area is due partly to the natural growth of the population, partly to the importation of great numbers of coolies.

**Established
and fluctuating
cultivation.**

The system of cultivation in the district falls into two main heads, established and fluctuating. In the established area the staple crop is *sali* or transplanted paddy, land is not readily resigned, and it frequently possesses a considerable market value. In the fluctuating tracts the staple crops are mustard, pulse, and summer rice (*ahu*), and continual change is one of the essential elements of cultivation, the same field being seldom cropped for more than three years in succession. Fluctuating cultivation is, however, only practiced on the Majuli and in the marshes that fringe the southern bank of the Brahmaputra.

**Annual and
periodic
leases.**

The bulk of the land on which the staple crops of the district are grown is held direct from Government by the actual cultivators of the soil on annual or periodic lease. The periodic lease confers a right of re-settlement and a heritable and transferable title. Annual leases merely authorise the occupation of the land for a single year, though in practice the

* Commissioner's letter dated 21st September 1867.

rights of transfer, inheritance, and re-settlement are recognized. The only drawback of the annual lease lies in the fact that if the land happens to be required by Government, it can be resumed without payment of compensation to the occupant. Land held under either form of lease, or any individual field within the holding can be resigned, on formal notice of the fact being given to the Deputy Commissioner or Subdivisional Officer.

The basis of the land revenue system is the mandal, The mandal. the village accountant and surveyor who draws a modest stipend ranging from Rs.8 to Rs.12 per mensem. In March he proceeds to his circle, inspects the fields which have been formally resigned to see whether they have been actually relinquished, tests the boundaries of fields taken up in recent years to see whether they are in accordance with the map, and surveys land which has been broken up for what is called the regular settlement or for which a formal application has been filed. His two principal registers are the *dagchitha* in which particulars are entered for each field within the village, and the *jama'andhi* or rent roll, which classifies the fields by holdings, and shows the area covered by each lease. During the hot weather he is occupied with the revision of his maps and registers, and the preparation of his leases. When the winter comes, he again proceeds to the field, distributes the leases he has prepared, and surveys the land which has been broken up since his former tour, and which is included in what is known as the *dariabadi* or supplementary settlement.

He is also required to prepare statistics of the area under different crops, he assists in the collection of the revenue, and is often ordered to report on local disputes connected with the land. In most Provinces in India a settlement is concluded for a term of years. During its currency no land which is held on lease can be resigned, and there is not, as a rule, any appreciable quantity of waste land to be taken up. This system is not in force in the Assam Valley. Land held on ordinary lease can be resigned at any time, provided that all the revenue due is first paid in and that proper notice is given to the authorities. These resignations are an essential element of the system of fluctuating cultivation and in 1903-04 over 18,000 acres were excluded and over 32,000 acres were included in the settlement. Figures for each year since 1900-01 will be found in Table XII.

**Superior
settlement
staff.**

Above the mandal comes the supervisor kanungo, a peripatetic officer, on pay ranging from Rs.30 to Rs.40, who checks his work both in the field and in the office. The superior revenue officers are called sub-deputy-collectors and draw salaries ranging from Rs.100 to Rs.200 per mensem. The appointments are usually made by selection from candidates who must be of good physique and moral character, of respectable family, under 25 years of age, and must either have taken a university degree or have read up to that standard.

The total sanctioned staff for the Sibsagar district is 3 sub-deputy-collectors, excluding those employed as tahsildars, 10 supervisor kanungoes, and 205 mandals. In cadastral areas the average size of a mandal's charge is 9 square miles of settled land.

The different tenures in the district fall under two main classes—(1) those under which land is held for the cultivation of ordinary crops, and (2) those under which grants have been made for the growth of tea or other crops, which are not included amongst the ordinary staples of the Province, and which require a considerable amount of capital for their production. The bulk of the land included in the first class is settled under the ordinary rules at full rates, but there are also considerable areas of revenue free (*lakhiraj*) land and land settled at half rates (*nisf-khiraj*). In the time of the Ahom kings the whole of this land is said to have been held rent free, but in 1834 the Government of India ruled that “all rights to hold lands free of assessment, founded on grants made by any former Government, must be considered to have been cancelled by the British conquest. All claims, therefore, for restoration to such tenures can rest only on the indulgence of Government, without any right” Mr. David Scott, the first British Commissioner of Assam, found that, even under the Ahom Rajas, these revenue free lands had been assessed at the rate of five annas a *pura** and he

Land tenures. *Lakhiraj* and *Nisf-khiraj* land.

* A *pura*=4 *bighas*. 3·025 *bighas*=1 acre.

imposed this cess, which was subsequently raised to eight annas, upon them. The Government of India then directed that an enquiry should be instituted into these claims, and that all cases in which land was held on *bonâ fide* grants dating from before the time of the Burmese conquest, or on account of services which were still performed, should be reported to them for orders. These instructions were not fully observed by the Commissioner of that time, Captain (subsequently General) Jenkins. This officer, for reasons which have never been ascertained, drew a broad distinction between *debottar* or temple lands, and *brahmottar* and *dharmottar* lands, i.e., lands which were devoted to some religious purpose but were not actually the property of a temple. The former he released from all claims for revenue ; on the latter he imposed the rate assessed by Mr. Scott, which happened to be half the full rates prevailing at the time. No report was even submitted to the Government of India, and no final orders were ever received from them, but the right of the former class of proprietors to hold free of revenue, and of the latter at half the usual rates, has been definitely recognized.

The total area of *lakhiraj* land in the district in 1902-03 was 39,095 acres, and of *nisf-khiraj* land 4,991 acres. The area settled year by year at full rates is shewn in Table XV. In the Mikir Hills no attempt is made to measure up the area actually occupied by the people, and in lieu of land revenue a tax of Rs. 2 is imposed on every house.

Two sets of rules were in force for the grant of land for tea prior to 1861. The underlying principle in each case was that the land should be held on long leases at low but progressive rates of revenue, and that precautions should be taken against land speculation by the imposition of clearance conditions.

Grant of land for the cultivation of special crops.

Between 1861 and 1876 the fee simple tenure of waste land grants was put up to auction at an upset price of Rs. 2-8 an acre, which in 1874 was raised to Rs. 8. The holders of grants under the earlier rules of 1838 and 1854 were allowed to purchase a fee simple tenure by payment of twenty times the revenue then due, provided that the clearance conditions had been carried out. Advantage was very generally taken of this concession, and there are now in the district only 5,194 acres of land held under the rules of 1838, and 726 acres under the rules of 1854, while there are 124,570 acres held on fee simple tenure. The existing rules came into force in 1876. The land is sold at an upset price of Re. 1 per acre, for, though it is nominally put up to auction, there is no case on record in which more than one applicant appeared to bid. For two years the grant remains revenue free and the rates gradually rise to 8 annas an acre in the eleventh and one rupee in the twenty-first year. The lease runs for 30 years, and when it expires the land is liable to re-assessment. The total area settled under these rules will be found in Table XV.

When Mr. Mills visited the district in 1853 it was divided into 130 mauzas with an average revenue of about Rs. 900 per mauza. The general tendency since that

Mauzas and tahsils.

date has been to increase the size of the unit of collection and to reduce the cost. In 1867, the mauzadars, as the collecting officers were called, received 15 per cent of the revenue as commission, and were allowed half the revenue of land reclaimed during the currency of the settlement. Three years later their commission was reduced to 10 per cent, and, in 1872, the further restriction was imposed that this 10 per cent could only be drawn on the first Rs.6,000 of revenue, 5 per cent being allowed on revenue in excess of that sum. In 1883, the idea gained ground that Government would do better by putting the mauzadar aside and employing salaried officials as a collecting agency. Mauzas were accordingly amalgamated and placed in charge of an official called a tahsildar, who was remunerated by a fixed salary and was exempted from the responsibility imposed upon the mauzadar of paying in the revenue on the due dates, irrespective of the amounts actually collected by him.

The first tahsils opened in Sibsagar were at Namtidol, Jorhat, and Golaghat in 1892, after experience had already been gained of the working of the system in Lower Assam. Three years later tahsils were started at Sibsagar, and at Athgaon in the Golaghat subdivision. In that year about 50 per cent of the total land revenue demand was collected through the agency of tahsildars.

**Comparative
advantages
of tahsildars
and mauza-
dars.**

The tahsildari system is cheaper than that of collection through mauzadars, the cost in one case being about 5 per cent, in the other 7 per cent of the gross amount realized. Serious difficulties are, however, experienced in dealing direct with such a large body of raiyats, and

there is no doubt that the tahsil system is not as popular with the people as the one which it replaced. A mauzadar of experience knows whether delay in payment is due to shortness of funds or to recusancy; he knows the time which is most convenient for payment in individual cases, and as he is not bound by the *kist* dates, his collection admits of an elasticity which no Government rules can establish. It has the further advantage of providing a body of representative men, who, while regarded by the people as their leaders, are bound to the Government by the facts of their position. It has accordingly been decided to try the experiment of gradually breaking up the tahsils, and substituting in their place mauzadars who will be entrusted with the duty of collecting from Rs. 20,000 to Rs.30,000 of revenue. In accordance with this policy the tahsils at Sibsagar, Jorhat, Golaghat and Athgaon have already been resolved into their constituent mauzas.

The revenue demand on account of the regular settlement is due in two instalments, three-fifths on January 15th and two-fifths on the 15th February, except in those villages which meet the Government demand from the sale of mustard and pulse, where it is due in one instalment on March 15th. The demand on account of the supplementary settlement is also due in one instalment on that date. If a raiyat defaults a notice of demand is issued calling upon him to pay up the amount due.* This

Arrange-
ments for
the realiza-
tion of reve-
nue.

* It has recently (1905) been proposed to authorise District Officers to dispense if they consider it necessary with the notice of demand, and also to impose a small fine not exceeding one rupee on habitual defaulters.

usually has the desired result, but if further steps are called for the defaulters property is attached. It is very seldom necessary to do more than this, but, as a last resort, the goods and even the lands of the defaulter can be sold. In 1903-04, notice of demand was issued on account of 12 per cent of the total land revenue demand and property was attached on account of 5 per cent. The number of cases in which it was necessary to have recourse to sale was very small, and the revenue on account of which property was sold only represented 0·2 per cent of the total demand. The number of cases in which an estate is put up to auction is comparatively small, and it is not unfrequently the case that, even when advertised for sale, it attracts no bid. In the more sparsely settled portions of the district it has hardly any selling value, and where it would fetch a considerable price it seldom comes to the hammer.

Area of un-
settled
waste.

The figures in the margin show the total area of the district as reported by the Assistant Surveyor-General, Calcutta, the settled area, and the area of reserved forests in 1902-03, and the area of waste land at the disposal of Government in that year. No less than 59 per cent. of

	Sq. miles.
Total area of the district	... 4,996
Settled area	... 1,192
Area of reserved forests	... 876
Area of waste land	... 2,928

the total area of the district falls in the latter category, but it must not be supposed that the whole of this area is fit for cultivation or human

habitation. The figures include the area of roads and of tracts that are permanently under water, which in Sibsa-gar with its network of rivers draining into the mighty

Brahmaputra amounts to a very considerable total. It also includes the area of the Mikir Hills which could never support a dense population, of the unhealthy valley of the Dhansiri, of extensive tracts which are submerged during the rainy season, and are hardly fit for permanent habitation, and of land which is too high or barren to be fit for the growth of food crops. It has already been shown in the chapter on population that over the greater part of the plains portion of the district the density is fairly high, and the proportion of good waste land still available for settlement is probably quite small. There is in fact a tendency to emigrate from Sibsagar to Lakhimpur, and this to any one acquainted with the character and habits of the Assamese clearly indicates that in the localities from which emigration is taking place some pressure on the soil is beginning to be felt. The total area and the area of unsettled waste in each revenue unit outside the Mikir Hills is shown in Table XV. A. The greater part of this waste is situated in the flooded tracts on either side of the Brahmaputra.

In 1903-04, the revenue raised under the different heads of excise in Sibsagar was just over seven lakhs of rupees, nearly five-sevenths of which were derived from opium. Prior to 1860, no restriction was placed upon the cultivation of the poppy. The evil effects of unrestrained indulgence in opium were undeniable, and in that year poppy cultivation was prohibited, and the drug was issued from the treasury, the price charged being Rs. 14 a seer. This was raised to Rs. 20 in 1862, Rs. 22 in 1863, Rs. 23 in 1873, Rs. 24 in 1875, Rs. 26 in 1879,

Excise.
Opium.

Rs. 32 in 1883, and Rs. 37 in 1890, the price at which it now stands. While Assam was under the Bengal Government licenses for the retail vend of opium were issued free of charge. In 1874, a fee of Rs. 12 per annum was levied on each shop, and in the following year it was raised to Rs. 18. Between 1877 and 1883 the right to sell opium in a particular *mahal* was put up to auction, but this system was found to be unsatisfactory, and in the latter year the individual shops were sold as is done at the present day.

Steady decrease in:
consumption.

The statement in the margin shows that during the last quarter of the century there was a steady decrease in the quantity of opium issued in the district.

This, no doubt, was partly due to the repressive effect of a heavy excise duty, partly, in all probability, to the spread of civilization and to the growth of a feeling that opium-eating was not quite good form. In 1835, Capt. Mathie, Collector of Darrang, reported that opium cost about Rs. 5 a seer. Since 1890, it has cost from Rs. 40 to Rs. 50 a seer, and it is evident that such high prices must tend to check the growth of the opium habit amongst those who have not yet taken to the drug. The facilities for purchase have also been very much curtailed. In 1873-74 there were 1,378 licensed shops in the Sibsagar district—in 1903-04 there were only 186. At the same time it cannot be denied that opium smuggling is comparatively easy, and the profits of the business large. In 1879, the difference between the treasury price of opium at Patna

	Maunds issued.
1873-74	482
1879-80	464
1889-90	397
1899-00	369

and Sibsagar was Rs. 10 per seer, but since 1890 it has been twice that sum. In 1901, a small preventive force consisting of one inspector, two sub-inspectors and five chaprasis was sanctioned for employment in the Province, but they did not succeed in detecting any cases of importance, and they have recently been amalgamated with the ordinary excise staff.

Opium is generally swallowed in the form of pills or mixed with water and drunk. Madak is made by mixing boiled opium with pieces of dried pan leaf, and stirring it over the fire. The compound is then rolled up into pills and smoked. Chandu is made out of opium boiled with water till the water has all evaporated, and is smoked like madak in the form of pills. Opium is not generally smoked in Assam, and this form of taking the drug is usually supposed to be more injurious than when it is simply swallowed. The figures in Table XVI suggest that the Ahoms are still very much addicted to the opium habit. The Mikirs are great consumers of the drug but, in spite of the presence of a large Mikir population in the west of the Golaghat subdivision, the amount of opium issued in this portion of the district, is not half of that issued in Sibsagar. Even Jorhat, though it has a larger population than Sibsagar, takes very little more than half the opium used in the eastern subdivision.

The Assamese are seldom spirit drinkers, and the indigenous tribes generally content themselves with the strong beer (*laopani*) which they brew from rice.

Method of
consump-
tion:
Ahoms great
opium
eaters.

Country
spirit

Provision has, however, to be made for the foreign population who consume large quantities of country spirit. This spirit can be easily prepared by any cooly, so that to prevent illicit distillation Government has to provide them with reasonable facilities for obtaining the liquor they require. Up till the end of 1904-05 it was the practice to put up the right to manufacture and sell liquor at certain specified localities to public auction. The statement in the margin shows the number of shops and the prices paid for them of recent years. The foreign population increased very nearly three-

	No. of shops.		Revenue. Rs.
1873-74	9	...	11,424
1879-80	26	...	33,314
1889-90	35	...	64,864
1899-1900	33	...	1,43,385

fold during the last twenty years of the century, yet it will be seen that the number of shops was only increased by seven. The large in-

crease in revenue was partly due to the growth of the liquor drinking population, partly to competition amongst the liquor vendors which forced up the prices of the shops at auction. It has recently been decided to establish a central distillery in the district as it is thought that by this means it will be possible to ensure the supply of a better quality of liquor. The amount of revenue raised from country spirit in each subdivision will be found in Table XVI.

Laopani.

Laopani, or rice beer, is the national drink of the unconverted tribes, and a special name, *modahi*, is applied to those who have to some extent attorned to Hinduism, but have not yet abandoned their ancestral liquor. It is also taken by some of the humble Hindu

castes, and is largely used by garden coolies if facilities are not afforded to them for obtaining country spirit. The following is the usual system of manufacture followed. The rice is boiled and spread on a mat, and *bakhar* is powdered and sprinkled over it. After about twelve hours it is transferred to an earthen jar, the mouth of which is closed, and left to ferment for three or four days. Water is then added and allowed to stand for a few hours, and the beer is at last considered to be ready. The usual proportions are 5 seers of rice and 3 chattaks of *bakhar* to half a *kulsi* of water, and the liquor produced is said to be much stronger than most European beers. Liquor is sometimes illicitly distilled from *laopani* or boiled rice, by the following simple method. An earthen pot with a hole in the bottom is placed on the top of the vessel containing the *laopani* or rice, and the whole is set on the fire. The mouth of the upper pot is closed by a cone-shaped vessel filled with cold water, and a saucer is placed at the bottom of the pot over the hole. The vapour rises into the upper of the two jars, condenses against the cold cone, with which the mouth is closed, and falls in the form of spirit on to the saucer beneath. Care must, of course, be taken to see that the various cracks are closed against the passage of the spirituous vapour, but this can easily be done with strips of cloth.

Ganja is usually mixed with water, kneaded till it becomes soft, cut into small strips, and smoked. Wild ganja grows very freely in Assam, but it is doubtful whether it is much used except as a medicine for cattle.

It does not produce such strong effects as the ganja of Rajshahi, but the leaves are sometimes dried and mixed with milk, water, and sugar to form a beverage. The number of shops, the quantity of ganja issued, and the revenue obtained in each subdivision will be found in Table XVI. The quantity taken in Golaghat is comparatively small.

Income tax. The total receipts under the head of income tax in 1903-04 amounted to Rs. 35,132, about two-thirds of which were realized from the salaries paid to garden managers and their staff. The receipts under the head of "other sources of income" amounted to Rs. 8,362 paid by 203 persons. More than three-fourths of this was derived from the 141 persons assessed under the head of commerce and trade, in spite of the fact that the wealthiest Kaiyas in Jorhat and Golaghat pay income tax in Calcutta on the profits made in the Sibsagar district. Forty-one persons of the professional class were assessed in 1903-04, and paid altogether Rs. 1,268. The assessment under Part IV of the Act is based on the reports of the local revenue officials. The district is a progressive one and the receipts from income tax have steadily increased. In 1887-88, they amounted to Rs. 28,600 and they rose steadily to Rs. 44,400 in 1902-03. It is a significant fact that the increase in the assessment under the head "other sources of income" was considerably higher than the increase under the head "salaries paid by companies and private employers." The marked decrease in the following year was due to Act XI of 1903

which raised the minimum taxable income from Rs. 500 to Rs.1,000.

The receipts from stamps in 1903-04 amounted **Stamps.** to Rs. 77,300, three-fourths of which were derived from the head judicial stamps. The revenue raised under this head was higher than that derived from any other district in the Assam Valley; the revenue from non-judicial stamps was exceeded in Lakhimpur alone. Details for later years will be found in Table XIII

Public Works are in charge of an Executive or **Public Works.** Assistant Engineer who is usually assisted by four upper and four or five lower subordinates. The Public Works Department are entrusted with the construction and maintenance of all the larger public buildings. The most important are the jail, the public offices, schools and post and telegraph offices at district and subdivisional headquarters, circuit houses, dāk bungalows, and inspection bungalows on provincial roads. Inspection bungalows on other roads are maintained by the Local Boards. The most important provincial roads which are directly under the Department are the trunk road which runs for 114 miles through the district, the road from Golaghat to the Brahmaputra, and the road from Disangmukh steamer ghat through Sibsagar to Nazira railway station. The Public Works Department are also responsible for the maintenance of the protective embankments which have been thrown up along the rivers in the neighbourhood of Sibsagar. It has already been explained that Local

Board works that require professional skill or engineering knowledge are usually made over to the Executive Engineer for execution. The principal difficulties with which the Department has to contend are the absence of an artizan class, and the scarcity and dearness of unskilled labour. It is to these two causes that the heavy cost of public works in Sibsagar is largely due.

Government. For general administrative purposes the district is divided into three subdivisions : Sibsagar (*sadr*) is at present under the immediate charge of the Deputy Commissioner, and Jorhat and Golaghat are entrusted to assistant magistrates who are almost invariably Europeans. The headquarters of the district will, however, soon be transferred from Sibsagar to Jorhat. The Deputy Commissioner is allowed two subordinate magistrates and one sub-deputy collector as his immediate assistants, and a second magistrate and a sub-deputy collector are usually posted at each of the stations at Jorhat and Golaghat.

Criminal and civil justice. Appeals lie to the Deputy Commissioner from the orders passed by magistrates of the second or third class and from the orders of first class magistrates to the Judge of the Assam Valley districts. Appeals from the Judge lie to the High Court of Fort William at Calcutta. In 1902, there were 7 stipendiary and 4 honorary magistrates in the district, and the former decided 2,640 and the latter 74 original criminal cases. In the course of these proceedings 5,890 witnesses were examined. Altogether there were 1,975 cases under the Penal Code return-

ed as true, the immense majority of which were either offences against property or the human body. Criminal work is heavier in Sibsagar than in any other district of the Assam Valley. Elsewhere the Assamese are singularly free from criminal tendencies or instincts, but cases of burglary are by no means uncommon in the neighbourhood of Jorhat. The number of murders, though not as high as in Lakhimpur, is still above the average. In the ten years ending with 1889 there were on the average six during the year. In the next decade the annual average rose to 11, and in 1900 there were 19, or one case for every 30,000 people, a ratio more than four times as high as that prevailing in the Province of Bengal in 1901. Most of these murders are committed in a fit of passion and are often due to jealousy. Now and again, however, there are cases which argue a considerable degree of intelligence in the perpetrator of the crime. One such occurred in 1897. An Assamese living near Jorhat went to a Kaiya's shop and informed the merchant that there was a Miri living near the Brahmaputra who wished to purchase coral and gold leaf. He offered to guide the Kaiya to the house, and the man set out taking with him an assortment of jewellery from which the Miri could make his choice. The whole story of the Miri was a fabrication, and at a lonely part of the road the Assamese murdered and robbed the unsuspecting Kaiya. Then, with the object of diverting suspicion from himself, he went to the shop and enquired for the missing man, saying that he had been compelled to leave him near the Miri's house. After some days, when the

Kaiya failed to return, suspicions were aroused, and an enquiry was instituted which resulted in the detection and execution of the murderer. The average annual value of property said to be stolen during the decade ending with 1899 was Rs.25,000. Cattle theft is fairly common, and attempts have even been made to steal elephants, in spite of the difficulties attendant on the concealment and disposal of the missing property.

Special rules are in force for the administration of criminal justice in the Mikir Hills tract. The jurisdiction of the High Court is barred, and the Chief Commissioner is the chief appellate authority. The Deputy Commissioner is empowered to pass sentences of death, transportation, and imprisonment of seven years or upwards subject to the confirmation of the Chief Commissioner. Fine or fine and imprisonment may be awarded in lieu of any other punishment, provided that the amount of punishment awardable for such offence under the Indian Penal Code be not exceeded, and no appeal lies of right from any sentence by the Deputy Commissioner of less than three years' imprisonment.

Civil Justice. There is no separate staff for the trial of civil cases and assistant magistrates act as Munsifs, while the Deputy Commissioner is Subordinate Judge. He has, however, recently been relieved of the task of hearing civil appeals, which was a very heavy tax upon his time, and they now go direct to the Judge at Gauhati. Civil work is much heavier than in the other districts of the Assam Valley. In 1902, there were 2,257 cases instituted in the Munsifs'

Courts, while 157 appeals were disposed of by the Subordinate Judge, a number more than half of the total returned for the whole of the Assam Valley Division. The great majority of the suits instituted in the Munsif's Courts are for money and moveables, and nearly three-fourths of the total were disposed of without contest.

The Deputy Commissioner is the District Registrar, while one of the assistant magistrates acts as sub-registrar at each of the subdivisions. The number of documents registered is small, and, in 1903, was only 1,696, but this is a larger number than was registered in any other district of the Assam Valley, with the exception of Goalpara. Registration.

The civil police are in charge of a District or Assistant Superintendent of Police. Police. The sanctioned strength consists of 3 inspectors, 25 sub-inspectors, and 303 constables. 172 smooth bore Martinis are allotted to Sibsagar, and a reserve of men is kept up at the district and subdivisional headquarters who are armed with these weapons and are employed on guard and escort duty. Up-country men, Nepalese, and members of the aboriginal tribes are usually deputed to this work, though attempts are made to put all the constables through an annual course of musketry. Table XIX shows the strength and cost of the police in 1881, 1891, and 1901. Rural police are not employed, such assistance as is necessary being given by the village elders or *gaoburas*. In addition to their regular duties in connection with the prevention and detection of crime, the police are required to check the returns of vital statistics, manage pounds, enquire

into cases in which death has not been due to natural causes, to furnish guards and escorts, and to serve all processes in warrant cases. The cost of living is considerable, the demand both for skilled and unskilled labour is much in excess of the supply, and the pay of an ordinary constable is not sufficient to attract or retain a good class of recruit. The result is that the men resign their appointments on the slightest provocation, a fact which affords a serious obstacle to the efficient management of the force. For police purposes the district is divided into ten investigating centres. The names of these stations and the strength sanctioned for each will be found in Table XX.

**Military
Police.**

A portion of Sibsagar marches, however, with independent territory, and during the winter season it is thought desirable to have a small garrison of men trained for military duties available for cases of emergency. A detachment consisting of sixteen non-commissioned officers and men of the Lakhimpur military police battalion is accordingly stationed for six months of the cold weather at Abhaipur, at the foot of the hills occupied by the independent Naga tribes.

Volunteers.

In addition to the regular force of police there are a considerable number of volunteers residing in the district who can be called out when required. A corps of mounted infantry was first enrolled in Sibsagar in 1883 with a strength of 104 members. Eight years later the volunteers in the four upper districts of the Valley were formed into one corps known as the Assam Valley Mounted Rifles, and in 1896 the Mounted Rifles

were converted into Light Horse. The strength of the corps in 1903 was 312, 130 of whom were residing in Sibsagar.

There is a jail at the headquarters station of the **Jail** district and subsidiary jails at both of the two subdivisions. The jail compound at Sibsagar covers an area of 1.81 acres and is surrounded by a masonry wall. It contains accommodation for 40 male and 9 female convicts. The subsidiary jails at Jorhat and Golaghat are surrounded by bamboo palisades. The buildings are constructed of bamboo and timber, with thatched roofs at Jorhat and roofs of corrugated iron at Golaghat, and can accommodate 31 prisoners of all classes at the former and 32 at the latter place. Convicts are usually employed on gardening, oil pressing, paddy husking, and surki pounding, and when sentenced to more than 3 months' imprisonment are sent to Sibsagar. Female prisoners with sentences of over one month's imprisonment are drafted to Tezpur or Gauhati. Drinking water at Sibsagar and Jorhat is obtained from the tanks at those two places, and at Golaghat is drawn from a masonry well.

In 1841, Mr. Robinson of the Gauhati College described the state of education in the Assam Valley as being "deplorable in the extreme."* He pointed out that, unlike the Province of Bengal, where every village had its teacher supported by general contribution, provincial school had only recently been introduced in Assam, and their

* A descriptive account of Assam, page 277.

number was in consequence extremely small. Vernacular schools were first established at Sibsagar in 1840, and in 1847-48 there were 10 vernacular schools in the district. The next few years witnessed very little progress, as on the occasion of Mr. Mill's visit in 1853 there were only 9 schools of all grades. The condition of these schools was, moreover, far from satisfactory, and the Collector only proposed to keep up four, which were situated at Nazira and the headquarters of each of the three subdivisions. 1874-75 is the first year for which complete statistics are available, and the following abstract shows the progress of education since that year. Figures for years subsequent to 1900-01 will be found in Table XXII.

Year.	No. of secondary schools.	Pupils.	No. of primary schools.	Pupils.	Total number of pupils.	No. of persons in district to each pupil.	Percentage under instruction to those of school-going age.	
							Males.	Females.
1874-75	6	820	130	2,918	3,738	79	...	...
1880-81	5	693	125	3,745	4,438	83	15.32	0.24
1890-91	8	1,104	257	7,676	8,780	52	23.38	1.40
1900-01	14	1,928	328	10,110	12,038	50	24.00	1.50

Sibsagar is unusually well supplied with high schools. There are Government high schools at Sibsagar and Jorhat an aided school at Nazira, and three unaided schools at the headquarters of each of the three subdivisions. The Jorhat and Sibsagar Government schools are two

of the largest in the Province, and the school at Jorhat is the only Government high school in Assam in which the direct expenditure is entirely met from the fees paid by the pupils. Middle schools are situated at Sibsagar town, Hatipati, Jorhat, Cinnamara, Golaghat, Dingao and Marangi.

High schools are those institutions which are recognised by the Calcutta University as capable of affording suitable preparation for the Entrance Examination. The boys are taught from the earliest stage of their education up to the Entrance course as prescribed by the University of Calcutta, but many leave school without completing the course. Till recently English was taught in all the classes. The boys in the lowest class no longer learn that language, but the standard of instruction is higher than that prevailing in lower secondary (middle) schools. English is the medium of instruction in the first four classes of high schools, in the lower classes and in other schools the vernacular is employed. The course of instruction at middle English and middle vernacular schools is the same, with the exception that English is taught in the former and not in the latter. The following are the subjects taught in the middle vernacular course—(1) Assamese, comprising literature, grammar and composition, (2) History of India, (3) Geography, (4) Arithmetic (5) Elements of Euclid (Book I), mensuration of plane surfaces and surveying, and (6) simple lessons in botany and agriculture.

Primary schools are divided into two grades, upper and lower, but the proportion of boys in upper primary schools

Secondary
education.

Primary
education.

is only two per cent. of the total number, and this class of school, like the middle vernacular, is slowly dying out. The course of study in lower primary schools includes reading, writing, dictation, simple arithmetic, and the geography of Assam. In upper primary schools the course is somewhat more advanced, and includes part of the first book of Euclid, Mensuration, and a little History. The standard of instruction given still leaves much to be desired, but efforts have been recently made to improve it, by raising the rates of pay given to the masters. Fixed pay is now awarded at average rates of Rs. 8 per mensem for certificated and Rs. 5 per mensem for uncertificated teachers, supplemented by capitation grants at rates ranging from 3 annas to 6 annas for pupils in the three highest classes.

There is a survey school at Jorhat in which villagers can be trained to serve as mandals, and scholarships are granted to a limited number of Assamese boys who are brought up as artizans in the Jorhat railway workshops. Law classes are also held at Sibsagar.

**Medical
staff.**

The district is in the medical charge of the Civil Surgeon who is stationed at Sibsagar. It contains seven dispensaries, and the supervision of the work done at these institutions is one of the most important duties of the Civil Surgeon. He also acts as Superintendent of the Jail, he controls and inspects the vaccination department, and is required to visit and report on all tea gardens on which the death rate for the previous year has exceeded 7 per cent.

The conditions under which the people pass their days are far from conducive to a long mean duration of life. Their houses are small, dark, and ill ventilated, and in summer must be exceedingly close and oppressive. They are built upon low mud plinths, and are in consequence extremely damp, and the inmates instead of sleeping on beds or bamboo platforms, which would cost them nothing to provide, often pass the night on a mat on the cold floor. Their attire, which is suitable enough for the warm weather, offers but a poor resistance to the cold and fogs of winter, and many lives are annually lost from diseases arising from chills, which might have been avoided by the purchase of a cheap woollen jersey. The houses are buried in groves of fruit trees and bamboos, which afford indeed a pleasant shade, but act as an effective barrier to the circulation of the air, and increase the humidity of the already over-humid atmosphere. Sanitary arrangements there are none, the rubbish is swept up into a corner and allowed to rot with masses of decaying vegetation, and the complete absence of latrines renders the neighbourhood of the village a most unsavoury place. The water-supply is generally bad and is drawn either from shallow holes, from rivers, or from tanks in which the villagers wash their clothes and persons. All of these are undoubtedly factors which contribute to produce a high mortality, and nearly every one of them could be eliminated.

Complete
absence of
rural sanita-
tion.

In comparison with Central and Lower Assam Sib-sagar is, however, a very healthy district. The greater part of it consists of a wide plain lying south of the

Brahmaputra, and for some reason or another it would seem that the south bank of the river, except in those parts where the Assam Range projects into the valley, is much healthier than the country on the north even though it may be situated at some distance from the Himalayas. There is not much jungle near the principal centres of the population, the proportion of unsettled land is comparatively small, the winter season is cold and bracing, and the rainfall is abundant. It has hitherto been exempt from the dreadful scourge of *kala azar*, and if only the people would pay more attention to the most elementary laws of sanitation, the indigenous population would in all probability increase with great rapidity.

Vital statistics.

Vital statistics are reported by the *gaobura* or village headman to the mandal of the circle, this report being in theory submitted every second week. In practice they were received at much longer intervals, as the *gaobura* was an unpaid servant of Government and not very amenable to discipline. It has recently been decided to allot to each *gaobura* 2½ acres of land revenue free, and it will now be possible to enforce a stricter adherence to the rules. Between 1891 and 1901 the mean recorded birth and death rates were 24 per mille, and it is obvious that both of these figures were much below the truth. The statistics of age recorded at the census are, however, so unreliable, and the disturbing effect of immigrants is so great that it is not possible to fix a normal birth and death rate for the district.

Fever and bowel complaints are the forms which death most often takes in the Sibsagar district, at any rate according to the official returns. These returns are, however, so inaccurate, and so little reliance can be placed on the diagnosis of the reporting agency, that the figures hardly repay examination. Most fatal illnesses are accompanied by a rise in temperature, and the villages are in consequence very prone to ascribe every death to fever. Epidemics of cholera from time to time produce a high mortality, for though it is apparently endemic in the district, it occasionally breaks

Causes of mortality.

			Cholera. Death rate per mille.
1884	...	...	6.2
1886	...	...	4.1
1888	...	...	5.3
1890	...	...	11.6
1894	...	...	5.7
1897	..	...	9.8

out with quite exceptional violence. The abstract in the margin shows the recorded death rate from this cause in the years when cholera was most prevalent.

Small-pox also appears from time to time in a virulent form. The highest death rates per mille recorded from this cause during recent years were 2.2 in 1896 and 5.1 in 1897. Vaccination has, however, made considerable progress amongst the people, and small-pox is not as a rule responsible for many deaths. Other diseases which are prevalent in the district are measles, whooping cough with its attendant pulmonary complications, worms, and parasitic skin diseases.

Though there can be little doubt that many lives are annually lost which could be saved by proper treatment,

Increase in facilities for obtaining medical aid.

it is satisfactory to know that of recent years there has been some increase in the facilities for obtaining medical aid, and the extent to which the people avail themselves of the advantages now offered to them. From the

Dispensaries.	No.	Patients treated.	No.
1881	2		8,561
1891	3		19,220
1901	6		51,765

statement in the margin it appears that for every patient treated in 1881 there were 6 in 1901. The principal dispensaries are those

situated at Sibsagar, Jorhat, and Golaghat, each of which had a daily average attendance in 1903 of 64, 82, and 50, respectively. The diseases for which treatment is most commonly applied are malarial fevers, worms, cutaneous disorders, dysentery, diarrhoea, rheumatic affections, bronchitis, and other diseases of the organs of respiration. The number of patients treated at each dispensary in 1900 and the succeeding years will be found in Table XXV.

**Native
methods of
midwifery.**

There are very few professional midwives amongst the Assamese, and a woman in her confinement is generally attended by her relatives or friends. In difficult cases they can render little help, and recourse is had to Heaven for assistance. A goat or duck is sacrificed, and *mantras* are tied round the neck and arm of the woman or inscribed on a brass vessel which is placed where her eyes can fall upon it. In cases of false presentation attempts are made to drag the child out by anything that offers, and the abdomen is kneaded in the hope that the foetus may be expelled. In the

absence of medical aid, and this aid is seldom to be obtained, the mother in such cases generally dies. The confinement sometimes takes place in a small hut which has been specially constructed for the purpose, and the patient's bed generally consists of an old mat laid on the floor. The unfortunate mother receives practically no assistance. If the labour is a natural one, all is well, but if complications arise the case has usually a fatal termination, and it is probable that many lives are lost owing to disregard of the rules of cleanliness which are of such paramount importance in these cases. The nucleus of a professional midwife class is, however, to be found in the *bejins* or female doctors, who receive a small remuneration for attending cases and practise beyond the limits of their own villages.

In addition to the Government dispensaries there is a hospital on almost every one of the tea gardens in the district.

A professional survey of the district was made at **Survey.** the time when Assam was still a division of Bengal and maps were published in 1873. They are on the scale of one mile to the inch and show the sites of the villages and the physical features of the country. A topographical map on the scale of four miles to the inch was published in 1882 and is now under revision. An area of 1,521 square miles, which included the more densely populated portions of the district, was cadastrally

surveyed by the professional party during the seasons of 1888-89, 1889-90, and 1891-92. The maps are on the scale of 16 inches to the mile, and in addition to topographical features show the boundaries of each field. Certain areas which were omitted by the professional party were subsequently surveyed by local agency on the basis of a theodolite traverse, and the results obtained from the cadastral survey both by the professional and local agency have been utilised in the subsequent revision of the maps.*

*The area so surveyed up to 30th September 1899 was 208 square miles.

Gakhirkhoa „ ...	5,350	2,896‡	+2,454	31.64	169	2,936

* The Jokaisukh mauza (population 2,509 in 1891) has been transferred from the Namtidol to the Sibsaigar tahsil, the figures for 1891 have been corrected. The population of Joktali mauza in 1891 (7,426) has also been deducted, as the mauza no longer forms part of the tahsil. The population of the Athkhel mauza should also have been deducted, but unfortunately it is not known.

† The Kampur mauza (population 9,341 in 1891) has been transferred to the Sibsaigar tahsil. The figures for 1891 have been corrected.

‡ Portions of this mauza, containing in 1891, 2,877 and 1,557 persons have since been transferred to the Lahing and Nakachari mauzas respectively. The figures for 1891 have been corrected.

* Barpathar and the following five mauzas have been transferred from the Naga Hills since 1891; the areas are not available.

† This mauza was transferred from Nowgong; the area is not available.

‡ The area of the district was furnished by the Assistant Surveyor-General and does not tally with the sum total of the areas of mauzas and tahsils as the latter figures were obtained from the District Officer.

TABLE XVA.

Unsettled area in each tahsil and mauza in 1903-04.

	Total area.	Un- settled area.	REMARKS.
SIBSAGAR SUBDIVISION—			
Tahsils—Namtidol ...	116	34	
Sibsagar ...	160	89	
Mauzas—Abhaipur ...	220	155	Includes 26 sq. miles of reserved forest.
Athkhel ...	61	20	
Dhopabar ...	43	12	
Hachara ...	14	3	
Joktali ...	19	3	
Khalaighogora ...	114	77	Includes 18 sq. miles of reserved forest.
Nazira ...	16	2	Includes 3 sq. miles of reserved forest.
Silakuti ...	54	22	Includes 30 sq. miles of reserved forest.
Thaura Panidihing ...	154	122	
JORHAT SUBDIVISION—			
Tahsil—Jorhat ...	144	21	
Mauzas—Baligaon ...	31	11	
Chaokhat ...	37	18	
Gakhirkhoa ...	18	3	
Hezari ...	37	26	
Holongapar ...	61	14	Includes 8 sq. miles of reserved forest.
Katabagar Charigaon ...	20	2	
Kharikatia Amguri ...	118	50	
Lahing ...	59	35	
Nakachari ...	50	17	Includes 11 sq. miles of reserved forest.
Parbatia ...	25	13	
Salmarā ...	349	293	
Simaluguri ...	26	12	
Teok ...	35	22	
GOLAGHAT SUBDIVISION—			
Tahsils—Athgaon ...	151	66	Includes 10 sq. miles of reserved forest.
Golaghat ...	179	88	
Mauzas—Ahataguri ...	135	123	
Barpathar ...	Not known.		
Barjan ...	Do.		
Dergaon ...	17 1/2	6	
Dimapur ...	Not known.		
Duar Bagari ...	202 1/2	202	There are only 123 acres of settled land.
Duar Disa ...	Not known.		
Gurjogania ...	27 1/2	7	
Kardaiguri ...	Not known.		
Michamara ...	49	30	
Naharani ...	13	3	
Namdayang ...	222	191	
Naojan ...	Not known.		
Rangamati ...	101 1/2	79	
Rengma (Eastern and Western).	Not known.		
Rengmapathar ...	Do.

PREFACE.

To those unacquainted with Assam it may perhaps seem strange that no directory should be attached to the Gazetteer of Lakhimpur. There is, however, only one town, Dibrugarh, within the district, and Dibrugarh has been described at length. One green village is very like another green village, and none possess such distinctive characteristics as would justify a separate and detailed description. Reference has, however, been made to all villages, which are noted either as trade centres of importance or as the seats of some particular industry. My acknowledgments are due to Major Cole, Deputy Commissioner of the district, who has been so good as to examine the Gazetteer in proof.

B. C. ALLEN.

CHAPTER I.

PHYSICAL ASPECTS.

Area and Boundaries—General Aspects—The North Bank—Mountain System—River System—Identity of Brahmaputra with Sangpo—Other Rivers—Lakes and Marshes—Geology—Climate—Fauna.

The district of Lakhimpur is bounded on the north ^{Area and Boundaries.} by the Himalayas, on the west by the Himalayas and Darrang, on the south by Sibsagar and by hills inhabited by independent Nagas, and on the east by hilly country, inhabited by savage tribes. On three sides it marches with territory that is not in the occupation of any civilized or even semi-civilized power, and the frontier has accordingly never been definitely defined. An Inner Line has been laid down under the provisions of Regulation V of 1873, which serves to mark the administrative boundary of the district. But, though for a short distance this line runs along the north bank of the Brahmaputra, the foot of the hills has always been accepted as the limit of British territory; and on the eastern and southern frontiers our officers are in the habit of getting their orders carried out, without having to resort to force, for some considerable distance beyond the Inner Line. The district as defined by the Inner Line is situated between 26°, 49' and 27°, 52' N., and 93°, 46' and 96°, 05' E., and covers an area of 4,529

square miles. Measured on a more liberal scale it lies between 26°, 50' and 28°, 17' N., and 93°, 46' and 97°, 15' E., and covers an area of 10,327 square miles.

**General
Aspects.**

Lakhimpur consists of a broad plain lying on either side of the Brahmaputra, bounded on three sides by hills. To the south these hills are only a few thousand feet above the level of the sea, and their sides are for the most part clothed in dense tropical forest. They lie in tumbled ridges, sharply serrated at the summit, and sloping steeply to the valleys with which they are intersected, and each of the main ridges is buttressed with spurs thrown out on either side. The hills that shut in the eastern end of the valley are considerably higher, and, on a clear day, the view to the north and east is bounded by a continuous chain of snowy peaks, which, if low in comparison with the giants of the Himalaya, attain at any rate the altitude of Mont Blanc. Along the north the nearer ranges are generally high enough to conceal the eternal snows beyond. North of North Lakhimpur, there are points in this chain which are nearly 10,000 feet above the level of the sea, but a little to the east of the Subansiri the level falls, and the outer hills are not more than two or three thousand feet in height. This, however, is not for far, and the level quickly rises to six or seven thousand feet near the gorge of the Dihang.

South of the Brahmaputra the plain is fairly high, and a broad belt of country along the foot of the hills is clothed in dense evergreen forest. Creepers spread in every direction over the larger trees, knitting them

into one great mass of foliage, and drop down here and there in graceful coils and loops. The forest is dense with bamboos, plantains, palms, and huge tree ferns; and the creeping cane, its sharp spikes hidden by its beautiful green leaves, acts as an effectual check on any one who lightly tries to penetrate these sylvan fastnesses. In the centre of the district much of the forest has been felled, and the plain is covered with fields of waving rice, or with stiff tea bushes ranged in rows with mathematical precision, and pruned down with equal accuracy to the same level. The planter's bungalow, the factory, and the cooly lines stand out above these even rows of shrubs; and it must be admitted that except for the patches of forest kept as a fuel reserve, and the avenues of trees which are often planted along the roads of the estate, there is little of the picturesque or beautiful in these plantations. The drainage of the country is carried off in small streams and *jans* which feed the larger rivers, and there are comparatively few swamps and *bhils* even in the neighbourhood of the Brahmaputra.

North of that great river the condition of affairs is somewhat different. A large portion of the country is still covered with tree forest, the level of the land is lower, and there are more *bhils* and marshes; while much of the country is exposed to inundation in the rainy season, and is covered with dense masses of grass and reeds, ranging from ten to twenty feet in height. The general effect is extremely picturesque. In the foreground are to be seen fields of waving rice, of a

The north
bank.

vivid green during the summer season, but changing to a rich gold as harvest time draws near. Round the edges of these rice *pathars* are groves of slender palms, broad-leaved plantains, and feathery bamboos, which conceal the cottages of the cultivators, while further back is often to be seen the dark green line of the primeval forest. The view is bounded to the north by the bluest of blue hills, whose sides are for the most part clothed with trees, though here and there are patches of white rock, where the cliff is too precipitous to afford a lodging for a plant or sapling, even in that rainy climate. In the far distance to the east there are ranges of high hills, whose peaks are covered with snow, and whose rocky sides are flecked with gleaming white. At all seasons of the year the country looks fresh, and cool, and green. The trees in the forest never lose their leaves, while the roads are often carpeted with grass, and bordered with ferns that recall the lanes of Devonshire.

Between Dibrugarh and Sadiya, the country north of the Brahmaputra is clothed with forest right to the foot of the hills, and is almost entirely destitute of inhabitants. Sadiya itself is a country of rivers, forest, and jungle, with patches of high ground covered with short springy turf. The road to Bomjur, our furthest outpost on the north, runs for the greater part of the way through a magnificent forest of gigantic trees. On one side there are glimpses of the great Dibang, here gliding gently along over some deep stretch of water, and anon rushing hurriedly down a

rapid, and foaming and roaring round some rock or sunken tree. On the other side can be seen the rugged mass of Sadiya peak, its grey sides flecked with snow, while in front, the blue hills rise in tumbled masses from the valley, their sides covered with a dense growth of trees.

Although Lakhimpur is surrounded on three sides by mountains, almost the whole of the area included within the Inner Line consists of a flat and level plain. An out-lying spur of the Naga Hills stretches from the Disang river through the south of the Jaipur and Tipling mauzas, and the Inner Line near Margherita has recently been thrown back to the Tirap, so as to include a few of the lower ranges of the Naga Hills. But apart from these mountains and a few isolated hills in the Makum and Buri Dihing mauzas, there is nothing to break the even level of the plain.

The principal river of Lakhimpur, as of every other district of the Assam Valley, is the Brahmaputra, but in this district it possesses a peculiar interest from the fact that it is here that it passes out of the regions of geography, and its true course becomes to some extent a matter of uncertainty. Hindu tradition describes the river as rising in the sacred pool of Brahmakund, some three or four days' journey east of Sadiya; but tradition can hardly be accepted by the geographer as scientific fact. The river that flows from the east has been followed far beyond the Brahmakund to the Rima Valley, where it is known as the Zayul Chu, and it is now generally believed that this river is only a

Mountain
system.

River
system.
The Brahma-
putra: its
identity with
the Gange.

tributary of the mighty Brahmaputra, and not the main channel of its waters. The Brahmaputra is supposed to be identical with the Sangpo of Thibet, which rises in $31^{\circ} 30' \text{ N.}$ and 82° E. , near the upper waters of the Indus and the Sutlej, a little to the east of the Manasarowar lakes. It has been traced almost continuously for a distance of 850 miles eastwards to Gya-la-Sindong, which is barely 150 miles from the Assam Frontier, but no explorer has yet succeeded in following the river right down to its junction with the Brahmaputra. It was at one time thought that the Sangpo might be identical with the Irawadi, but explorations which terminated in 1882, showed that the Sangpo could not flow east of Sama. It was then suggested that the river which flows past Sama was not identical with the stream that runs eastward from Sadiya to the Brahmakund, but was a tributary of the Sangpo, which flowed to the west of Sama into the plains of Burma. This theory was completely disproved by the explorations of Mr. Needham, who, in 1885-86, marched from Sadiya up the so-called Brahmaputra to Rima, a village east of Sama, and proved that the river at Rima, and the river that flowed past Sadiya are the same.

The Sangpo being denied an outlet towards Burma in any direction, the weight of evidence would suggest that it is identical with the Brahmaputra. Granted this premise, it seems probable that the channel by which it makes its way through the Himalayas is the Dihang, which is the largest river that falls into the Brahmaputra from the north, and at the point

of junction considerably exceeds in volume the river to which the Assamese have erroneously applied that name. In 1886-87 the Sangpo was visited by a native explorer, who stated that he followed its course nearly 100 miles south of Gya-la-Sindong, to a place called Onlet, which is only 8 miles from Miri Padam and 43 miles from the Assam Frontier; but it has not been found possible to check or confirm his report in any way.

The banks of the Brahmaputra are, as a rule, higher in Lakhimpur than in the districts lower down the valley, and in places they are covered with tree forest. Between the main banks there is a wide strath, in which the river oscillates from side to side, throwing out here and there divergent channels which after a time rejoin the parent stream. The waters of the river are heavily laden with suspended matter, and the smallest obstruction in the current is liable to give rise to an almond shaped sand bank. The next flood may wash this bank away or may only increase its size by fresh deposits of sand, and *churs* or islands of this nature, which have held their ground for a few seasons, soon become covered with a dense growth of reeds.

The principal rivers which fall into the Brahmaputra in Lakhimpur are, from the north bank, the Digaru, Diphu, and Kundil, which fall into it east of Sadiya, the Dibang, the Sesseri, the Dihang, the Subansiri, the Ranganadi, and the Dikrang. On the south bank it receives the Noa Dihing, the Dibru and the Buri Dihing. The Digaru, Diphu, and Kundil are of little

The tribu-
taries of the
Brahmaputra.

importance in the economy of the district. The Kundil flows past Sadiya, but the greater part of its course lies outside the Inner Line, and the same can be said of the whole of the Digaru, and almost all the Diphu. The Dibang, with its tributary the Dikrang, the Sessleri, and the Dihang can be described in general terms. They debouch upon the plain through gorges of great natural beauty, the current is swift, the bed of the river full of snags and boulders, and the scenery through which they make their way extremely picturesque. There is, however, hardly any portion of these rivers which lies within the Inner Line, and the want of population in their neighbourhood in the plains, and the savage character of the tribesmen in the hills, render them of no account as routes for traffic.

**The
Subansiri.**

The Subansiri is believed to rise far up amongst the mountains of Thibet, and enters the plains of North Lakhimpur through a gorge of singular beauty. On either side, the hills rise from the river, their sides being for the most part clad in dense tropical forest, the trees thrusting their roots into every crevice in the rocks, though here and there sheer cliffs rise straight from the still dark water. Creepers bind the trees together with a soft green veil, and slender palms, giant tree ferns, and broad-leaved plantains are to be seen on every side. The rocks near the water's edge are covered with moss and ferns, and nature seems to have been determined to produce a masterpiece of river, hill, and forest scenery. In places the river comes roaring down in rapids, which can only be shot by the most expert of boat-men ;

in places it stretches out in reaches of still green water whose smooth unruffled surface is fifty or sixty feet above the bottom. It enters the plains near Dolongmukh and flows a southerly and westerly course till it joins the Luhit near Garamur, and finally falls into the Brahmaputra opposite Dhansirimukh. Like other rivers that flow from the Himalayas, the banks are alternately sheer and sloping as the current sets from side to side; and on one hand there will be a steep wall of sandy soil some eight or ten feet high, while on the other there is a gently sloping beach stretching some hundreds of yards towards the higher levels. Before falling into the Brahmaputra, the Subansiri collects nearly all the drainage of the North Lakhimpur sub-division, the principal tributaries on the left bank being the Sampara, and the Koran. The Koran has two considerable tributaries, the Dhol, and the Charikaria or Sisi, which flows past Dhakuakhana, and though it joins the Koran is also connected by another channel with the Kherkutia Suti. On the right bank there is the Ghagar with its various tributaries, the Kadam, and several minor streams.

The Rangapani rises in the Daffa Hills and enters the plains near the Joyhing tea estate. From there it flows a southerly course till it falls into the Luhit to the west of Garamur, after receiving a large number of minor streams, all of them flowing in a southerly and easterly direction from the hills. The Dikrang is also a considerable river which flows from the hills into the Luhit.

The
Rangapani
and
Dikrang.

**The Buri
Dihing.**

South of the Brahmaputra the most important river is the Buri Dihing, which rises in the Patkai range, and flows a tortuous course with a generally westerly direction till it falls into the Brahmaputra, after a course of about 150 miles. Its principal tributaries are—on the right bank the Digboi, the Tipling, the Tingrai, and the Sesa; and on the left bank the Tirap and the Namsang. After leaving the hills, it flows along the southern border of the district past the important settlement at Margherita. It then winds its way through an outlying spur of the Assam range, passes Jaipur, the site of an old cantonment, Nahorkhutiya, where it is crossed by the Assam-Bengal Railway, and Khowang; and during the last part of its course forms the boundary between the Lakhimpur and Sibsagar districts. Below Jaipur the floods of the river do some damage, and steps are now being taken to repair an embankment which was constructed in the time of the Ahom Rajas. The spill water is, however, said to have a fertilizing effect, where the flood is not deep enough to injure the crop. Even as far from its mouth as Margherita, the Dihing is about 200 yards in width. The bed is sandy and in places obstructed with snags, and it is not very largely used for purposes of navigation.

**The Noa
Dihing and
Dibru.**

The Noa Dihing rises in the Singpho Hills and pursues a westerly and then a northerly course till it falls into the Brahmaputra east of Sadiya. Through the greater part of its course it flows through jungle land, and, as in the higher reaches the current is very strong, it is of little importance in the interior economy of the district. It is connected with the Buri Dihing, and its principal

tributaries are, on the left bank the Dirak, and on the right the Tengapani. The country between the Dibru-Sadiya Railway and the Brahmaputra is drained by the Dibru, but though it has given its name to the capital of the district, it is not a stream of very much importance. It rises in the Buri Dihing mauza, and receives in the course of its journey towards the Brahmaputra, a large number of petty *jans* and streams, the most important of which are the Dum Duma and the Dangori.

South of the river the level of the country is fairly high, and in the settled tracts there are not many *bhils* or marshes of importance. North of the Brahmaputra there is a heavy local rainfall to be carried off, and the rivers are liable to be swollen by the drainage of the hills through which they make their way into the district. Much of the country also lies comparatively low, and the water tends to collect in the lower levels and basins. Some of these *bhils* are extremely picturesque. In the centre lies the actual sheet of water, surrounded as a rule by a stretch of the richest pasture in which the cattle can graze knee-deep in the cold weather, while the whole is enclosed by a wall of elephant grass and reeds. The surface of the lake is dotted over with islets and clumps of flowering grasses, and in the cold weather is visited by flocks of duck and other aquatic birds. To the north the view is bounded by the hills, while in the near distance there is the dark green line of forest or bamboo groves. The most important *bhils* south of the Brahmaputra are the Garukhuti *bhil* in Jamira mauza, the Chaparu and

Lakes and
Marshes.

Kawamari *bhils* in Larua, and the Romai *bhil* in Madarkhat. North of the river there is the great Kani *bhil* in the Sisi mauza, the Pabhamari and Bangalmari *bhils* in Dhemaaji, the Bhimpara *bhil* in Kadam, and various other smaller sheets of water.

Geology.. The district consists of a wide alluvial plain composed of a mixture of sand and clay in varying proportions, and surrounded on three sides by hills belonging to the tertiary period. The mountains on the north lie beyond the frontier and have never been properly explored, but are believed to be composed of great thicknesses of soft massive sandstones, of tertiary age and fresh water origin. Practically nothing is known of the Mishmi Hills at the eastern end of the valley, beyond the fact that they contain limestone. The hills to the south consist of sandstones and shales, probably of Nummulitic age, interspersed with valuable coal measures and ironstones.* The geological deposits of economic value are gold, coal, petroleum oil, limestone, kaolin, and salt. The extent to which they have hitherto been worked and the possibilities of their further exploitation are discussed in a later chapter.

Climate. There is no district in the Assam Valley, and probably few in the plains of India, in which the climate is more endurable than it is in Lakhimpur. In October the rains stop, and the temperature begins to fall, the average maximum for that month being

* Further information with regard to the Geology of Upper Assam will be found in a paper by J. Malcolm Mac'aren, Esq., B Sc., F. G. S., Published in the Records of the Geological Survey of India, volume xxxi, part 4, 1904.

only 84·6 degrees Fahrenheit. During the four succeeding months the climate is delightful ; the total rainfall during this period at Dibrugarh only just exceeds six inches, the sky is clear, the sun though bright has little power, and the air is cool and pleasant. Fogs sometimes hang over the country in the neighbourhood of the Brahmaputra, but, by diminishing the period during which the earth is exposed to the influence of the sun's rays, they help to keep the country cool, and so are not an unmitigated evil. In January, the average maximum is less than 71 degrees, the average minimum less than 49, and December and February are very little warmer. In March and April, copious showers prevent the temperature from rising, and in the former month the average minimum is only 60° and in the latter less than 65°, while the average maximum is under 80°, though in April at Dhubri it is nearly 89°. From June to September is the only really unpleasant portion of the year. During these four months, nearly 72 inches of rain fall at the head-quarter's station, the air becomes saturated with moisture, and though, in comparison with other parts of India, the thermometer keeps fairly low, the damp heat is trying alike to Europeans and to natives. There are, however, few districts in the plains of India in which there is so small a portion of the year to which exception can be taken on climatic grounds ; and the difference between the eastern ends of the Brahmaputra and the Surma Valley, can be judged from the fact that the average annual maximum at Dibrugarh is

5.5 degrees less than it is at Silchar. Further details with regard to the temperature in Dibrugarh will be found in Table I.

Rainfall. As in other parts of the Assam Valley, the rainfall is much heavier near the Himalayas than it is in the centre of the district. At Pathalipam it is 168 inches in the year, and at the subdivisonal station of North Lakhimpur it is 128 inches. At Dibrugarh it drops to 114 inches, and anywhere between Sadiya and Margherita it is only about 100 inches. Further details with regard to the average rainfall will be found in Table II.

Storms and Earthquakes. Lakhimpur is seldom visited by violent and destructive storms, though an interval of dry weather in the rainy season is often closed by a thunder shower, which at once relieves the oppressiveness of the atmosphere. Hailstorms sometimes do damage, especially to tea gardens, but are very local in their sphere of action. The rivers occasionally overflow their banks, but the area liable to inundation is generally well known, and is accordingly avoided by the cultivator, and the crops do not often suffer serious injury. Shocks of earthquake are felt from time to time, but there is no record of serious damage ever being done, and even the great earthquake of 1897 left this district practically unscathed.

Fauna. Wild animals are numerous, and include elephants, rhinoceros, bison (*bos gaurus*), buffalo, tigers, leopards, bears, wild pig, and different kinds of deer of which the principal varieties are the sambar (*cervus unicolor*),

the barasingha or swamp deer (*cervus duvaucelii*), the hog deer (*cervus porcinus*), and the barking deer (*cervulus muntjac*). Elephants are fairly common, especially near the hills, and when the crops are ripening do much damage unless the numbers of the herds are regularly kept down. For this purpose the district is divided into seventeen mahals or tracts. The right to hunt in each mahal is sold by auction, and the lessee is required to pay a royalty of Rs. 100 on every animal captured. The method usually employed is that known as *mela shikar*. Mahouts, mounted on staunch and well-trained elephants, pursue the herd which generally takes to flight. The chase is of a most arduous and exciting character. The great animals go crashing through the thickest jungle and over rough and treacherous ground at a surprising pace, and the hunter is liable to be torn by the beautiful but thorny cane brake, or, were he not very agile, to be swept from his seat by the boughs of an over hanging tree. After a time, the younger animals begin to flag and lag behind, and it is then that the opportunity of the pursuer comes. Two hunters single out a likely beast, drive their elephants one on either side, and deftly throw a noose over its neck. The two ends of the noose are firmly fastened to the *kunkis*, as the hunting elephants are called, and as they close in on either side, the captured animal is unable to escape, or to do much injury to his captors, who are generally considerably larger than their victim. The wild elephant is then brought back to camp where it is tied up for a time and gradually tamed.

Small kheddahs too are occasionally erected, and the animals gradually driven into them, but this system of elephant hunting is too well known to require description. Fifty-seven animals were caught in 1902-03, the last year in which the mahals were sold by the Deputy Commissioner. Rhinoceros are now becoming scarce, but are occasionally met with in the swampy ground in the wilder portions of the district. They breed slowly, and, as the horn is worth more than its weight in silver, and the flesh is prized as food, they present a tempting mark to the native hunter. The two-horned variety of rhinoceros is said to be found in the desolate hills which lie between Assam and the Khamti Valley, but has not been shot by any European.

Herds of wild buffaloes are found north of the Brahmaputra, and wild bulls often serve the tame cows that are kept by the Nepalese. Bison are generally found near the hills and in the neighbourhood of tree forest; tigers, leopards, and bears are met with in the wilder parts of the district. A curious animal called the takin (*budorcas taxicolor*) is found in the Mishmi hills, but, though its horns are not unfrequently brought down to Sadiya, no European has as yet succeeded in shooting it. According to Blandford, it is a heavily made animal much larger than a serow, with a big head, thick horns, and stout limbs. The length from snout to vent is six and a half feet, and the height at shoulder three and a half feet. It appears to be allied to both goats and antelopes. Wild animals cause little loss of human life, but in 1903, are said to have accounted for nearly two

thousand heads of cattle. The number of human beings killed in that year, by different animals was as follows :— elephants 3, tigers 3, bear 1, wild buffalo 1, total 8. Rewards were at the same time paid for the destruction of 34 tigers, 13 leopards, and 15 bears. Small game include wild geese and duck, snipe, florican (*sypheotis bengalensis*), black and marsh partridge, pheasants, and hares.

CHAPTER II.

HISTORY—NATIVE RULE.

Early traces of Hinduism in Lakhimpur—The Chutiyas—Their Conquest by the Ahoms—Rise of the Ahoms—Koch and Muhamadan Invasions—Rudra Singh in 1700 A.D., rules the whole of Assam Proper—The Moamaria Insurrection—The Burmese Invasion—Occupation by British in 1825—Manners and Customs of Ahoms—The Paik System—The fighting qualities of the Ahoms—Arbitrary Government and Savage Punishments—Social Life—Attitude towards Hinduism—The position of Women—Condition of Country in 1824.

Early legends.

The earliest legends suggest that Hindu princes were reigning in Lakhimpur some centuries before the Christian era. Local tradition assigns to Bhismaka the construction of a fort whose ruins are to be seen between the gorges of the Dikrang and Dibang rivers. The walls of this fort were made of hewn granite, surmounted by a breast-work of loop-holed brick, and were evidently constructed by persons possessed of considerable engineering skill; but there is nothing to connect them with Bhismaka or the heroic age of the Mahabharata. The white scar of a landslip on the hills is said to be the remains of a wedding feast, which Bhismaka was giving to celebrate the union of his daughter Rukmini with Sisupal, when the bride was carried off by Krishna; but little or no

reliance can be placed upon these legends, and, according to the ordinary Pauranic accounts, Bhismaka's kingdom was situated in Berar. At the same time it must be admitted that there are good reasons for supposing that centuries ago Lakhimpur formed part of the territory of a civilized prince, who was overthrown by the Chutiyas, a tribe who are still found in large numbers at the eastern end of the Assam Valley.

Of the early history of the Chutiyas not much is known, but they are believed to be members of the great Bodo race, and to have entered the plains from the north-east. Colonel Dalton, quoting from an ancient chronicle, which is confirmed by local tradition, states that the Chutiyas were originally settled in the hills near the Subansiri river. The tribe lived in large independent villages, like the Abors and Miris of the present day. In course of time, one Bibar seems to have attained a certain measure of supremacy over the neighbouring villages, and the process begun by the father was carried on still further by the son. He extended his influence over the wild tribes, assumed the title of Lord of the Hills, and, at the head of his followers, descended into the valley of the Brahmaputra. He there defeated a king called Bhadra Sen, and founded a capital called Ratnapur, which is said to have been situated in the Majuli or in the North Lakhimpur subdivision. Gaur was at that time still under the rule of a Hindu dynasty, so the irruption of the Chutiyas must have taken place prior to its conquest by the Muhammadans in 1204 A.D. The Chutiya leader assumed the name of Ratnadwaj

The
Chutiyas

Pal, contracted an alliance with a neighbouring Raja called Naipal, and generally consolidated his power. He excavated tanks, built temples, and constructed a line of forts along the frontier. He then asked the king of Kamateswar* to bestow a daughter in marriage upon his son, and on that prince rejecting the proposed alliance with scorn, constructed a road to his territories protected by forts erected at intervals along the line of march, and so alarmed the Kamateswar Raja that his daughter was handed over without delay. Ratnadwaj visited the king of Gaur, and left a son to be educated at his Court. The boy died and his body was despatched to his father, who received it when he was building a new city, called in memory of this event Sadiya (the place where the corpse was given).

Ratnadwaj was succeeded by five kings, each of whom bore the name of Pal. The last of the series, Karmadwaj, had one daughter for whose hand there were so many suitors, that the king, with a Jephthah like fatuity, decided to submit the selection of his son-in-law to the arbitrament of fate. A flying squirrel was seen hovering over Sadiya, and the hand of the princess was promised to the man who could bring it down with an arrow. A poor young Chutiya was successful, and much to her disgust the proud princess was united to her lowly spouse. The old king then resigned in favour

* Presumably Kamatapur in Kuch Behar, which is said to have been founded by Niladwaj, whose grandson Nilambar was conquered by the Muhammadans at the end of the 15th century. This date would be too late for the invasion of the Chutiyas and the expedition against Kamatapur is probably quite mythical.

of his son-in-law, who assumed the name of Nitipal.* Naturally enough he was utterly unfitted for the high position to which he had so suddenly and undeservedly been raised, and the kingdom was soon reduced to a state of anarchy and confusion. The Ahoms seized this opportunity to push home their attacks, and the power of the Chutiyas was broken once for all. Little reliance can, however, be placed upon these legends. The story of the poor Chutiya boy who marries the princess is probably a poetical description of the descent of the tribe into the valley, and of the subjugation of the Hindu dynasty reigning in Lakhimpur. The date of the downfall of the Chutiya kingdom, according to the Chutiya Buranji, is moreover, 150 years later than that assigned to this event in the Ahom chronicles, which state that it took place in 1523 A.D.†

The Ahom historians say that when they entered Assam in 1228 A.D., the Chutiyas were established at Sadiya, and were masters of the country as far west as the Disang river. Hostilities broke out between the two powers towards the middle of the fourteenth century. In 1376 A.D. the Chutiyas declared that they were ready to make peace, invited the Ahom king to a regatta on the Safrai river, and put him to death, as soon as they had got him into their power. The two

The Ahom
account of
the Chutiyas

* According to another version the king left an infant son, for whom Nitipal acted as regent.

† Mr. H. J. Kellner in a manuscript note in the Nowgong office says, that it must have occurred before 1503 A.D. The General who conquered the Chutiyas was Phuchunmung Bor-gohain who was killed in a great battle between the Ahoms and Kacharis at Kaliabar in 1503.

tribes continued to live in a state of intermittent conflict, but at the beginning of the sixteenth century the struggle began to assume an acute form. The Chutiyas at first met with a considerable measure of success. They pitched their camp at Dikhomukh, raided the territory of the Ahoms, and were, at any rate, not worsted in the engagements that ensued. Another account represents the Chutiyas as extremely stupid. They mistook scarecrows sent down the river on rafts for the enemy, and, when preparing a night attack by water, they were so drunk that they forgot to unmoor their boats. On waking the next morning they were so puzzled to find themselves still in the same place, that they at once retreated without attempting to engage the enemy.

In 1523 the Chutiya king began to treat for peace, but declined to accept the Ahom terms, which involved the surrender of ancestral heirlooms in the shape of a gold umbrella and bracelets. The attack was accordingly resumed, and the Chutiya king retreated with his army to the hill Chantan or Chandangiri. The Ahoms in their pursuit experienced the difficulties which at the present day confront our own troops in their transfrontier expeditions. The soldiers at first retreated but they were rallied by their officers; and, in the engagements that ensued, the Chutiya king and his son were killed. Their heads were conveyed to the Ahom prince Suhunmong, more generally known as the Dihingia Raja, and placed by him at the foot of the stairs leading to the house of their principal God at Cherideo. The administration of Sadiya

was then entrusted to an Ahom noble, and the leading Chutiya families deported to places lower down the valley. But the tribe again rebelled, it was only with difficulty that this fresh revolt was stamped out, and as late as 1572 A.D., an expedition was sent against an insubordinate Chutiya chief.

From 1523, A.D., till the final expulsion of the Burmese by the British in 1825, Lakhimpur, in name at any rate, formed part of the territory of the Ahom kings, and some account must now be given of the origin of this people and of their gradual expansion into an important power.* The Ahoms were a Shan tribe from the kingdom of Pong in the upper valley of the Irawadi, who, at the beginning of the thirteenth century, crossed the Patkai, and settled in the south of the territory which has since been formed into the districts of Sibsagar and Lakhimpur. The country at the foot of the hills was occupied by tribes of Morans and Borahis whom they easily subdued, and who were absorbed by inter-marriage with their conquerors. To the west and north, however, they were confronted by far more powerful nations. Upper Assam was ruled by the Chutiyas, and on the west, there was the strong Kachari kingdom, with its capital at Dimapur, which included the western part of what is now the Sibsagar district, and a considerable portion of Nowgong. The conquest of the Chutiyas by the Dihingia Raja has already been

* The description of the manners and customs of the Ahoms has been taken from old Ahom Burangis or Chronicles, translations of which will be found in the office of the Superintendent of Ethnography.

described, but he did not rest content with his successes in the east, and in 1536 he sacked Dimapur, killed the Kachari king, and compelled his successor to remove his capital to Maibang, on the northern slopes of the North Cachar Hills.

**Koch and
Muhamma-
dan inva-
sions.**

The Ahoms were now supreme in Upper Assam, and it is evident that the eastern portion of Darrang was included in their territory, as in 1523 a large number of Chutiya families were deported to a place a little to the east of the Bhareli river, which bears the name Sootea or Chutiya to the present day. They were still, however, exposed to danger from the Koch and Muhammadan powers in the west. In 1532 they defeated, with great slaughter, a Muhammadan invader named Turbuk on the banks of the Bhareli river ; but a few years later they were conquered by the Koch king, Nar Narayan, who occupied their capital Gargaon, the modern Nazira, and exacted tribute from the Ahom prince.

At the beginning of the seventeenth century they were again involved in war with the Muhammadans, as their king Pratap Singh declined to surrender Bali Narayan, the Koch prince. This monarch had fled to the Ahoms for protection, and sagaciously pointed out that in their own interests it was most desirable to maintain a buffer state between themselves and the great power that confronted them on the west. Most of the fighting took place in Lower Assam ; but in 1615 A.D., a Musalman army under Satrajit advanced as far as the Bhareli, to avenge a Muhammadan trader, who had been put to death by the Ahom king. The Muhammadans, though at first

successful, were subsequently defeated both on land and water with great slaughter. The Ahoms are said to have crossed the Bhareli by a bridge, and to have turned the flank of their opponents. The bulk of the invaders were killed, and the few prisoners who were taken were subsequently put to death by the Ahom generals, much to the indignation of their ruler, who degraded his officers for this cold blooded murder.

The war then dragged on in Lower Assam, but, in 1637 A. D. on the death of Bali Narayan, the Bar Nadi, which at present forms the western boundary of Darrang, was fixed as the frontier between Muhammadan and Ahom territory. In 1658, the Ahoms took advantage of the confusion that ensued, when Shah Jahan fell sick, to extend their arms to the Sankosh; but three years later they were driven back by Mir Jumla the Nawab of Dacca, who occupied Gargaon, and there concluded a treaty with the Ahom Raja Chutumla, otherwise known as Jaiadwaj Singh. The stars in their courses fought, however, on the Ahom side. The rains set in with a severity exceptional even in that rainy land, the country was converted into a swamp, and disease made havoc of the Muhammadans crowded together in their waterlogged camp. A large number of men were lost in the retreat down the valley, and by 1667, the Ahoms had again established themselves at Gauhati. A few years later, this town was retaken by the Muhammadans, but it was captured again by the Ahoms during the reign of Gadadhar Singh (1681-1695), and, from that time onward, Goalpara

remained the frontier outpost of the Muhammadan dominions.

Rudra Singh
1696-1714
A. D.

The zenith of the Ahom power was reached in the reign of Rudra Singh, who founded a new capital at Rangpur, and waged successful war against the Rajas of Cachar and Jaintia. Two large forces marched the one through the North Cachar Hills, the other through the Jaintia Hills to Jaintiapur, and the general in command succeeded in arresting the Jaintia Raja, and deporting him to the Assam Valley. The Ahoms were, however, unable to impose their yoke upon the free and savage highlanders, who rose as one man and butchered the garrisons which had been left in a chain of forts across the Jaintia Hills. Rudra Singh was the first of the Ahom kings to publicly become the disciple of a Hindu priest, and, after his death, the power of the Ahom kingdom began steadily to decline.

Sib Singh.
1714-1744,
A. D.

His son Sib Singh was a weak prince, much under the influence of his wives, whose name has come down to posterity as excavator of the great tank near which the present station of Sibsagar (Sib's tank) stands. Both he and his two successors were ardent Saktists, and erected numerous temples, and made liberal grants of land and *paiks*, for the maintenance of their special form of Hinduism.

Pramatta Singh,
1744-1761.

Rajeswar Singh,
1761-1769.

The reign of his successor Pramatta Singh was uneventful, and, during the incumbency of the next prince Rajeswar Singh, the signs of the decay of the Ahom power became all too clear. The Raja of

Manipur was driven from his home and applied to the Ahom king for aid. Orders were issued for the despatch of an expedition, but the nobles, to whom the command was entrusted, excused themselves on various grounds and declined the proffered honour. The army lost its way when endeavouring to cross the Patkai, a large number of men perished, and, though ultimately the Manipur Raja succeeded in regaining his dominions, it does not appear that the assistance of the Ahoms materially contributed towards his success.

Lakshmi Singh's reign was signalized by the outbreak of the Moamaria insurrection. The causes of this insurrection are not quite clear. According to the chroniclers, a certain Hathidharia Chungi with one Nahor Kachari came to offer their annual tribute of elephants to the king. The elephant which they tendered to the Borbarua was a lean and sorry animal, and, as an expression of his disapproval, he cut off their hair and noses, flogged them, and drove them away. Boiling with indignation at this outrage, Nahor proceeded to the house of a Hari woman, whose daughter he espoused, and from whom he received a set of metal plates, covered with mystical incantations to confound the enemy. He then applied to the Moamaria gosain for help, which was readily afforded him, and the standard of revolt was raised. This is the account given by the Ahom Chroniclers, and it differs to some extent from the story as told by the Moamaria gosain at the present day. According to this authority, the leaders of the rebellion were two Moamarias named

Lakshmi
Singh.
1769-1780.
The Moa-
maria Insur-
rection.

Nahor Khora and Ragho Neogay, who, after they had been punished for failing to deliver the elephants required, went for assistance to their gosain. The gosain himself declined to listen to their proposals, but they succeeded in winning over his son Gagini Bardekha, who gave them a weapon consecrated with the magic plates of the Kalpataru. The Kalpataru was a sacred book which Anirudha is said to have obtained from Sankar Deb, though the Ahom chroniclers contemptuously assert that it was the property of a sweeper woman.

Success and
subsequent
defeat of
Moamaras.

From the very first the rebels carried all before them. The royal armies were defeated under circumstances which suggest that men and officers alike were guilty of gross incompetence and cowardice; and Lakshmi Singh was driven from his capital and captured. The insurgents then proceeded to appoint Ramakanta, the son of Nahor Khora, to be their Raja. Marauding parties harried the country on every side, and the misery of the common people was extreme. A report at last gained ground that orders had been issued for the execution of all the former officers of state, and this incited the adherents of the king to make one final effort. The signal for the attack is said to have been given by one of the wives of Lakshmi Singh. Ragho, who was one of the most influential men amongst the Moamaras, had forcibly taken her to wife, and, as he was bending down at the *bihu*, to offer his largess to a dancing boy, she cut him down with a sword. On the death of their leader, the rebel forces were surprised and scattered, and a pitiless vengeance taken that spared neither age

nor sex.* The house of the moamaria Mahunt was surrounded, and almost the whole of his family was killed before his eyes, while all the officers appointed by the Moamaras were seized and beaten to death. The wives of the rebel prince were treated with savage cruelty. One of them was flogged to death, while two others had their ears and noses cut off and their eyes put out.

In 1780, Lakshmi Singh died, and was succeeded by his son Gaurinath, in whose reign the Moamaria insurrection broke out anew, and with increased violence. At first, the king's troops met with some measure of success, and orders were issued outlawing the rebels and authorising any person to kill any Moamaria he might meet, regardless of time, place, sex, or age. Such orders seem to have been only too well adapted to the temper of the people, and, according to the Ahom chronicler, "the villagers thereupon massacred the Moamaras with their wives and children without mercy." The rebels in their turn were not slow to make reprisals; they plundered the country on every side, and "the burning villages appeared like a wall of fire." The ordinary operations of agriculture were suspended, no harvests could be raised, and famine killed those whom the sword had spared. "The price of a katha of rice rose to one gold mohur, and men starved in crowds under the trees forsaking their wives and children." The highest Hindu castes are said to have eaten the flesh of cows, and dogs and jackals were devoured by the common people.

**Gaurinath
Singh.
1780-1794.**

**Moamaras
again
victorious.**

* The Moamaras say that 790,000 members of their sect were killed, which is no doubt an oriental exaggeration.

In 1786, the rebels under Bharat Singh inflicted a decisive defeat upon the royal troops, and took Rangpur, the capital, by storm. The king fled to Gauhati, and in his terror even left his wives behind him. His generals remained behind in Upper Assam and carried on the contest with varying success. Troops were despatched to their assistance from Manipur, but most of them were ambushed and cut up, and the survivors had no heart to carry on the struggle. The desolation of the country is thus described by the Ahom chronicler. "The Matakhs harried the temples and the idols of the gods, and put to death all the sons and daughters of our people. For a great length of time our countrymen had no home, some took shelter in Bengal, some in Burma, some in the Daffa Hills, and others in the fort of the Bura Gohain, who was fighting with the Matakhs for years and months together." Bharat Singh ruled at Rangpur for upwards of six years and coins are extant which bear his name; but in 1792 a small British force was sent to the assistance of the Ahom king under the command of Captain Welsh. Gauhati, which had been captured by a mob of Doms under a Bairagi, was re-taken, Krishna Narayan, the rebellious Raja of Mangaldai was subdued, and in March 1794 Rangpur was re-occupied after a decisive victory over the insurgents. Captain Welsh was then recalled, but the Ahom king was able to keep his enemies in check by the help of sepoys trained on the English system.

**Kamaleswar
Singh,
1794-1809,
A. D.**

A few months after the departure of Captain Welsh, Gaurinath died and was succeeded by his son Kamaleswar Singh. The country was still in a state of great

disorder. The Daflas, not content with harrying the villages on the north bank, crossed the Brahmaputra and attacked the royal troops near Silghat, but were repulsed with considerable loss. Even Europeans were not safe, and a Mr. Raush, a merchant of Goalpara, who had extended his business operations to Darrang, was robbed and murdered by "naked Bengalis." These freebooters then occupied North Gauhati, but when they attempted to make good their position on the south bank, they were defeated with heavy loss by the royal troops near Pandu-ghat. The Daflas again harried the Darrang district, and even enlisted Bengali sepoy in their service, but were ultimately conquered and dispersed. Victories were also obtained over the Moamarias and the Khamtis at the eastern end of the valley.

In 1809, Kamaleswar Singh was succeeded by his brother Chandra Kanta Singh. The Bor Phukan or viceroy of Gauhati incurred the suspicion of the Bura Gohain or prime minister and fled to Calcutta and thence to Burma. At the beginning of 1816, a Burmese army crossed the Patkai and re-instated the Bor Phukan; but shortly after their withdrawal Chandra Kanta was deposed, and Purandar Singh appointed in his stead. The banished monarch appealed to the Burmese, who, in 1818, returned with a large force and replaced him on the throne.

Final col-
lapse of the
Ahom King-
dom.

* This Mr. Raush, was the first European to interfere in the affairs of Assam. He sent 700 burkundazes to Gaurinath's assistance, but they were cut up to a man. A mass of masonry the size of a small cottage covers the remains of Mr. Raush's infant children at Goalpara.

They soon, however, made it clear that they intended to retain their hold upon Assam, and in 1820 Chandra Kanta fled to Goalpara, and from British territory began a series of abortive attempts to recover his lost kingdom. The Burmese were guilty of gross atrocities during their occupation of the country, the villages were plundered and burnt, and the people were compelled to seek shelter in the jungle. Women who fell into their hands were violated with every circumstance of brutality, and the misery of the unfortunate Assamese was extreme. Fortunately for them, causes of quarrel had by this time arisen between the British and the Burmese. In 1824, war was declared by the British Government, and a force was sent up the valley of the Brahmaputra which occupied Rangpur in January 1825, and compelled the Burmese to retire to their own territories; while in the following year, by the treaty of Yandaboo, Assam was ceded to the East India Company.

Ahom Administration.
The palk
system.

The above is but a brief account of the rise and fall of the Ahoms, but their history is more intimately connected with the Sibsagar district. It now remains to consider what is known of their social institutions, and the conditions under which those subject to them passed their lives.

The most striking feature in the economy of the Ahom state, and one which, (to judge from their conduct since they came under our rule) must have been extremely repugnant to the people, was the system of enforced compulsory labour. The lower orders were divided up into groups of three or four called *ghols* each

individual being styled a *powa paik*. Over every twenty *ghots* was placed an officer called *bara*, over every five *barus* a *saikia*, and over every ten *saikias* a *hazarika*. In theory one *paik* from each *ghot* was always employed on duty with the state, and while so engaged, was supported by the other members. The Raja and his ministers had thus at their disposal a vast army of labourers to whom they paid no wages, and for whose maintenance they did not even have to make provision. It was this system which enabled the Ahom Rajas to construct the enormous tanks and great embankments, which remain to excite the envy of a generation, which has been compelled to import from other parts of India almost all the labour required for the development of the Province and its industries. Many of the works constructed were of undoubted utility, but many, on the other hand, were chiefly intended for the glorification of their designers. Few objects are more worthy of the attention of an enlightened government than the supply of wholesome drinking water to the people. But the huge reservoirs, constructed by the Ahom kings, were out of all proportion to the population which could by any possibility have made use of them, while the close proximity in which these enormous tanks are placed is ample evidence that practical utility was not the object of their construction. On the other hand, embankments which were thrown up along the sides of some of the rivers near the capital, protected land which has become unculturable since they have fallen into dis-repair. The duty of providing the various

articles required for the use of the king and the nobility was assigned to different groups, which were gradually beginning to assume the form of functional castes. The rapidity with which these groups abandoned their special occupations, as soon as the pressure of necessity was removed, is a clear indication of the reluctance with which they must have undertaken the duties entrusted to them.*

Was.

But though the common people seem to have been compelled to supply an unnecessary amount of labour in times of peace, it was when war was declared that their sufferings were most pronounced. Certain clans of *paiks* were called out, and called out, it would seem, in numbers that were in excess of the actual requirements of the case; an error which entails the most disastrous consequences when the campaign is carried on in a country where supplies are scarce and communications difficult.

According to the Ahom chronicler, nearly 40,000 troops were despatched during the reign of Rajeswar Singh to reinstate the Manipuri Raja on the *gaddi*. Their guides, however, failed them, they lost their way in the Naga Hills, and about two-thirds of the soldiers perished, the mortality being chiefly due to famine and

* The system of enforced labour was no doubt unpopular, but it had much to recommend it. It taxed the people in the one commodity of which they had enough and to spare, *i.e.* labour. It also developed them on the industrial side, and the material comfort of the Assamese would possibly have been greater at the present day if they had not all of them been allowed to devote themselves exclusively to agriculture.

disease. The military dispositions even of Rudra Singh, one of their greatest princes, suggest a want of due deliberation in design, and a feebleness and lack of method in execution. In his expeditions against the Kachari and Jaintia Rajas, the Ahoms lost 3,243 persons, and the practical results obtained seem to have been insignificant. The Jaintia Raja is himself ready to accept the Ahom king as his suzerain, but cannot impose his will upon the independent hillmen, who owe him but a nominal allegiance, and who decline to surrender their freedom at the bidding of their king. The Kachari prince sends tribute, but only "a string of pearls, a dugdagi (locket) and a horse;" assuredly a very small return on the quantity of human life and treasure expended. It must at the same time be admitted that the loot obtained on this occasion was not inconsiderable. It included 3 large cannon, 2,373 large and small guns, 12,000 pieces of silver, 143 gold embroidered coats, 63 elephants and 11 Turkey horses, besides other things; and, more valuable perhaps than all, over 2,000 human beings. At the conclusion of this dangerous and troublesome expedition, each *paik* received a gratuity of four annas, *batta* which would hardly satisfy the sepoy of to-day. The descriptions of the campaigns against the Moamarias, given by the Ahom chroniclers, clearly show that the generals were often guilty of incompetence and cowardice, while the rank and file do not seem to have fully realized the dangers that beset a defeated army. Conditions such as these must of necessity have been disastrous to the private soldier.

Muhamma-
dans des-
cribe Ahoms
as brave
soldiers.

The Muhammadan historians of the invasion of Mir Jumla give, however, a more favourable account of the Ahom military dispositions.* Their resources seem to have been considerable, and, in the course of the expedition, the Muhammadans captured 675 guns, one of which threw a ball three "mans" in weight, besides a large number of matchlocks and other field pieces. No less than 1,000 ships were taken, many of which could accommodate three or four score sailors; and in the naval engagement which took place above Silghat in March 1662 A. D., the Assamese are said to have brought seven or eight hundred ships into action. The Ahoms are described as strongly built, quarrelsome, bloodthirsty and courageous, but at the same time merciless, mean, and treacherous. They were more than equal to the Muhammadans in a foot encounter, but were much afraid of cavalry. This *corps d'élite* did not, however, exceed some 20,000 men, and the ordinary villagers, who were pressed into the service, were ready to fling away their arms and take to flight at the slightest provocation.

Uncertainty
and arbitra-
ry character
of Govern-
ment.

Another factor, which cannot but have re-acted unfavourably upon the common people, was the uncertainty of tenure, under which both the ministers and king held office. A perusal of the Ahom chronicles leaves the reader with the impression that the ministers were continually being deprived of their portfolios, and not unfrequently of life itself. Hardly less precarious was

* An interesting account of this invasion will be found in the Journal of the Asiatic Society of Bengal, Volume XLI, Part I, pages 49-100.

the position of the king, and in the short space of 33 years, between 1648 and 1681, no less than two monarchs were deposed, and seven came to a violent end. Good government, as we understand the term, must have been impossible under such conditions, and we may be sure that the people suffered from this constant change of rulers. Buchanan Hamilton, writing at the beginning of the 19th century, states that the administration of justice under Ahom rule was fairly liberal. Important trials were conducted in open court, the opinion of assessors was consulted, the evidence was recorded, and capital punishment was only inflicted under a written warrant from the king. It is true, no doubt, that few persons possessed the power of imposing the death sentence. But they were allowed to inflict punishments which the victim could hardly be expected to survive, and his position was not unlike that of the heretic delivered by the inquisition to the civil arm, with the request that, "blood may not be shed."

Abundant evidence is available in the Ahom chronicles to show the arbitrary way in which the royal authority was exercised. The following instances are quoted from the reign of Pratap Singh, 1611-1649, A. D. A Kataki, or envoy charged with diplomatic relations with foreign powers, asked the Muhammadan commander on his frontier to supply him with two jars. His conduct was reported to the king, who immediately ordered him to be put to death. Another Kataki reported that he had heard from a down-country man that a Muhammadan force was advancing up the valley. The

Instances
of this.

king enquired of the Katakis, responsible for watching the movements of the enemy, whether this information was correct. This man declared that he was unable to obtain any confirmation of the rumour, whereupon the first Katakis was executed for presuming to meddle in matters with which he had no concern; a proceeding which seems to have been hardly calculated to ensure the supply of timely and accurate information. Three merchants then endeavoured to establish friendly relations between the Nawab of Dacca and the Ahom king. The latter prince took umbrage at such unwarrantable interference in affairs of state, and ordered the merchants to be put to death. It subsequently appeared that the facts had not been correctly represented, and the Bor Phukan and two other men responsible were promptly killed. A few years later, the king transported a large number of persons from the north to the south bank of the Brahmaputra, warning them that any one who attempted to revisit his former home would suffer the penalty of death with all his family "even to the child in the womb." Five hundred men attempted to return, as they wished, the chronicler informs us, to rear a brood of silkworms. The king had them arrested, and 300 were put to death, the remainder escaping in the darkness of the night.

Savage punishments: an official blinded for not dismounting before his official superior.

The following incident that occurred in the reign of Lakshmi Singh (1769-1780) is typical of the uncertainties of the time. One Ramnath Bhorali Borua, an officer of state, had the presumption to appear mounted in the presence of his official superior the Borborua. ▲

complaint was promptly laid before the king, who directed that both Ramnath and his brother should be deprived of sight. The injured man was not, however, destitute of friends, and came with his complaint to the Kalita Phukan, who had his private reasons for desiring the downfall of the Borborua. The Phukan went to the king, poisoned his mind against his minister with the suggestion that a conspiracy was on foot, a suggestion which in those days must always have seemed plausible enough, and, in a short time, the heads of the haughty Borborua, his two uncles, and his brother, were rolling in the dust. It is needless to multiply instances of the savage violence of the times, but the different forms of punishment in vogue call for some remark. Where life was spared, the ears, nose, and hair were cut off, the eyes put out, or the knee pans torn from the legs, the last named penalty generally proving fatal. Persons sentenced to death were hung, impaled, hewn in pieces, crushed between two wooden cylinders like sugarcane in a mill, sawn asunder, burnt alive, fried in oil, or, if the element of indignity was desired, shorn of their hands and feet and placed in holes, which were then utilized as latrines.

In the seventeenth century, it was no uncommon thing to compel conspirators to eat their own flesh, and more than one case is quoted, in which the father was forced to eat the liver of his son, a meal that was usually his last in this world. Punishment too was not restricted to the actual offender, but his wretched wife was liable to be handed over to the embraces of a Hari. Methods

such as these could hardly fail to have a terrifying effect on much more hardened criminals than the Assamese.

Social life
amongst the
Ahoms.

The Ahoms, even after they became a powerful nation, seem to have adhered to a simple style of life, in which there was little of extravagance or luxury. They have left few masonry memorials of their rule; the Raja's palace is almost invariably referred to as "a planked house," and, according to Buchanan Hamilton, the king alone was allowed to erect an edifice of brick. Shoes might not be worn except by the special license of the king, bedsteads and curtains were only to be found in the houses of the rich, and all but the most important visitors to a noble's house sat on the bare ground. The account given of the Raja's palace at Gargaon by the historian of Mir Jumla's invasion is pitched in a more exalted key. Twelve thousand workmen had been engaged on it's construction for a year, and the audience hall was 120 cubits long by 30 wide. "The ornaments and curiosities with which the whole woodwork of the house was filled defy all description: no where in the whole inhabited world would you find a house equal to it in strength, ornamentation and pictures." The absence of all reference to these wonders in the Ahom histories, suggests, however, that the Muhammadans were anxious to magnify the power and majesty of the prince they had subdued.

The native chroniclers are naturally most concerned with the wars and religious festivals, which bulked so largely in the eyes of the historians of the day, and with the rise and fall of successive families of ministers. It

is only incidentally that light is thrown on the social conditions of the people. The kings seem to have indulged in frequent tours about their territories, the itinerary usually followed being Rangpur, Sonarinagar, Tengabari, Dergaon, Jaliarang Bornagar, Bishnath, and Kaliabar. They were fond of fishing and shooting, and fully appreciated the excitement to be obtained from the hunting of wild elephants. On the occasion of coronations and royal weddings, a week was generally devoted to the festivities, which seem, however, to have consisted for the most part of prolonged feasts, accompanied by much unmelodious music. Towards the end of the eighteenth century, acrobats and jugglers were imported from Bengal, who amused their royal patrons with tricks which are still shown to the tourist on the P. & O. Kamaleswar Singh visited in state the two principal *sattras* of Auniati and Dakhinpat, and was entertained with all his retinue by the gosains. The chronicler quaintly tells us that the lunch at Dakhinpat gave greater satisfaction than the one at Auniati; but does not say whether this was due to the superior skill of the Dakhinpatia cook, or to the greater beauty of the *sattras* precincts.

The first Hindus to influence the Ahom kings were saktists, and Pratap Singh (1611-1649) persecuted the Vaishnavites, one of whose leaders had converted his son to Hinduism. The disciples of the gosains were seized, human ordure was placed on their foreheads, and they were degraded to the sweeper caste. To be found in the possession of religious books meant death, not only to the

Attitude of
Ahoms to-
wards Hin-
duism. Sa-
vage persecu-
tion of Vaish-
navism.

actual owner, but to every member of his family. Even Pratap Singh's spiritual pastors were not spared, and he denounced the new religion which, in spite of the adherence of the Raja, had not been able to save from death his own beloved son. He then assembled 700 Brahmans, ostensibly to perform a festival, and, as a punishment for their incompetency, degraded them to the status of *paiks*. These persecutions were continued by Gadadhar Singh, who in 1692, plundered the treasure houses of the Vaishnavite gosains, and cast the idols into the water. No respect was shewn even to the sacred head of the Auniati *sattr*a, and he was driven from his home to Tejikhat. He fared, however, better than the gosain of Dakbinpat, who had his eyes put out and his nose cut off, while many Hindu priests were put to death. A policy of extermination seems in fact to have been inaugurated, and, according to one chronicler, orders were issued for the destruction of every Hindu child regardless of sex and age. The king had large quantities of pork, beef, and fowls, cooked by men of the Dom caste, and compelled Kewats, Koches, Doms, and Haris to partake of their unholy food.

This policy of oppression was reversed during the reign of Rudra Singh, his son, who was publicly admitted as a disciple of the Auniati gosain; and, from this time forward, the influence of the priests seems to have increased.

The leading
gosains per-
secuted by
Moamaras.

During the Moamaras insurrection, the religious orders again fell upon evil times. The rebel king confined the persons of the four principal gosains, and extorted

Rs. 8,000 each from Auniati and Dakhinpat, and Rs. 4,000 each from Garamur and Kamalabari. Religion was degraded by the promulgation of an order that any person could be initiated on payment of a betel nut, and the common people availed themselves in crowds of this indulgence. Subsequently in the reign of Gaurinath Singh, the Moamaras attacked the Garamur *sattr*, burned it to the ground, slew a large number of the disciples, and nearly killed the gosain himself. His successor Kamaleswar Singh (1794-1809) found himself unable to pay the sepoy, whose services were indispensable for the maintenance of some sort of order in the kingdom. Following the example of other monarchs, he called upon the church to supply the funds for the support of the temporal power. Contributions were levied on all the mahunts, and the demands of the soldiers were satisfied.

But, though converted to Hinduism, the Ahoms found the restrictions of their new religion irksome; and their gosains, with the tact which they display towards their converts of the present day, allowed their new disciples a considerable degree of latitude. Rudra Singh, though he had been publicly admitted to the church by the Auniati gosain, feasted his followers on buffaloes and pigs on the occasion of his father's funeral; while not only buffaloes, but even cows found a place in the menu of his coronation banquet. At the time of the first Moamaria insurrection, the rebel chief made overtures to Lakshmi Singh, and offered him, apparently in good faith, a pig for supper. A present such as this, clearly

Laxity of
Ahom Hin-
duism.

shows that even towards the end of the 18th century, the Hinduism of the Ahom kings was one of the most liberal variants of that catholic creed. Before taking any decisive step, it was the practice to refer, not only to the Brahmans and Ganaks, but also to the old Ahom priests the Deodhais and Bailongs. These venerable men were required to consult the omens, by studying the way in which a dying fowl crossed its legs; a system of divination which is in vogue amongst many of the hill tribes of Assam to the present day. The restrictions of caste were evidently somewhat lax, as we hear that the Moamaria mahunt had an intrigue with a Hari woman; while at the beginning of the 19th century the viceroy of Gauhati took a fisher girl for his mistress, a breach of the convenances for which, it should be added, he was deposed.

**The position
of women.**

The influence of the Muhammadans in Assam Proper was so slight, that the low view they professed to take of the other sex had little or no effect upon the general population. The Ahoms, like their Burmese ancestors, held their women folk in honour, and even at the present day, the purdah, and all that it implies, is almost unknown in the country inhabited by the Assamese. The Ahom princesses seem to have taken a prominent part on ceremonial occasions, and not unfrequently exercised considerable influence on affairs of state. In the middle of the 17th century, two of the queens almost usurped the reins of government, and, according to the Ahom chronicler, "their words were law." When called to account by the successor of their husband, they

proudly stated that they had been of great service to the king, at a time when he was ignorant of the way in which he should behave, whether when "eating, drinking, sitting, sleeping, or at council." Sib Singh (1714-1744) is said to have abdicated in favour of his queens, hoping thereby to defeat a prophecy which declared that he would be deposed; and coins have been found bearing the names of four of these princesses. The mother of Lakshmi Singh dug a tank, and Gaurinath entrusted to his step mother the control of the Khangiamel, and consulted with his mother about affairs of state. It was not, however, only the princesses of royal blood who concerned themselves with public matters. At the time of the Moamaria insurrection, one Luki Rani was sent against the rebels; and the victory over Turbuk in 1532 is partly ascribed to the courageous action of the widow of the Borgohain, who had been killed in a previous engagement by the Muhammadans. Desperate at the loss of her husband, she put on armour and rode into the ranks of the enemy to avenge his death. No mercy was shewn her and she fell, pierced with spears; but her example emboldened the Ahoms, who at once advanced to the attack and defeated the Musalmans with great slaughter.

In estimating the effects of British rule, it is necessary to form a clear idea of the state of the Province at the time when it passed into our possession, and first it must be pointed out that the British did not conquer Assam in the sense in which that word is usually employed. The native system of government had completely broken

Condition of
Province at
time of ces-
sion to the
British.

down, the valley was in the hands of cruel and barbarous foreigners, and it was not as conquerors, but as protectors and avengers that the English came. They were certainly not inspired by any *lust* for land. For some time after the expulsion of the Burmese, the East India Company were doubtful whether they would retain their latest acquisition, and an attempt was made to administer the upper portion of the valley through a descendant of the Ahom kings.

The condition in which we found the country was lamentable in the extreme. For fully fifty years, the Province had been given over to desolation and anarchy. Life, property, honour were no longer safe, and the people in their misery had even abandoned the cultivation of the soil, on which they depended for their very livelihood. Bands of pirates used to raid up the valleys of the Dhansiri and Kakadanga, and return with their boats laden with booty, leaving ruin, death, and desolation in their wake. The hill tribes were no longer kept in order, and the Daflas descended and harried the submontane tracts, and even extended their depredations to the south of the Brahmaputra. The treatment, meted out to the unfortunate villagers, can be judged from the protest made by the hillmen to Rajeswar Singh, shortly before the collapse of the Ahom government, when they begged him "not to pull out the bones from the mouth of dogs." Buchanan Hamilton, writing in 1809 A. D., states that north of the Brahmaputra "there is no form of justice. Each power sends a force which takes as much as possible from the cultivator."

The memories of this miserable time survived long after it had passed away. In 1853, an Assamese gentleman Srijut Ananda Ram Dhekial Phukan, wrote as follows to Mr. Moffatt Mills. "Our countrymen hailed the day on which British supremacy was proclaimed in the Province of Assam, and entertained sanguine expectations of peace and happiness from the rule of Britain. For several years antecedent to the annexation, the province groaned under the oppression and lawless tyranny of the Burmese; whose barbarous and inhuman policy depopulated the country, and destroyed more than one half of the population, which had already been thinned by intestine commotions and repeated civil wars. We cannot but acknowledge, with feelings of gratitude, that the expectations which the Assamese had formed of the happy and beneficial results of the Government of England, have, in a great measure been fulfilled; and the people of Assam have now acquired a degree of confidence in the safety of their lives and property, which they never had the happiness of feeling for ages past."

Native testimony on this point.

Whatever errors have been committed by the British Government, and it is too much to hope that no mistakes of policy have been made during an administration of nearly eighty years, there can be no question that the introduction of a settled form of government has been of the greatest benefit to the immense mass of the people to whom it has been extended.

CHAPTER III.

HISTORY—BRITISH ADMINISTRATION.

Lakhimpur at first administered by native chiefs—The Khamtis at Sadiya—Matak—Purandar Singh's territory—The Singphos—The Mishmis—The Abors—The Miris—The Daflas—The Apatanangs—The Nagas—Lakhimpur Assamese in little more than name—Transfrontier explorations—Rima—Bor Khamti—The Patkai—Archaeology—Chronological table of native rulers.

Lakhimpur
not immediately
taken under direct
administration.

For the first few years after the expulsion of the Burmese, the administration of the remote and jungly tracts, which now constitute the prosperous district of Lakhimpur, was entrusted to the semi-independent chiefs whom we found in possession of the country. Sadiya and the villages in the neighbourhood was left till 1835 to the Khamti chief, who had seized this fief when the Ahom kingdom was tottering to its fall. Matak, or the country south of the Brahmaputra and west of the Buri Dihing, was ruled by the Matak chief or Bor Senapati till 1839; and between 1833 and 1838, the administration of the country north of the river, between Bishnath and Sadiya, was entrusted to Purandar Singh. Some reference must thus be made to these semi-independent principalities before referring to the history of the district under British rule.

Khamti
settlements.

The fertile plains of the Brahmaputra Valley have ever drawn towards them the tribesmen living in the

narrow glens and forest covered mountains with which they are surrounded; and, as the power of the Ahom kings began to wane, there was a forward movement of the hill men from the south and east. One of the most civilized of these tribes was the Khamtis, who occupy the rich valley east of the Daphabum which bears their name, and, in 1794, an offshoot from this horde advanced westwards into the valley of the Brahmaputra. They settled for a time on the Tengapani, but finding the Ahom Government in no condition to oppose their onward march, they crossed to Sadiya, expelled the local representative of the Raja, and took possession of the neighbouring country.

After the expulsion of the Burmese, the Khamti chief was recognised as the local Governor by Mr. David Scott, the Agent to the Governor-General on the north east frontier. He was allowed to collect poll tax from the villagers, and required, in lieu of tribute or of taxes, to maintain a contingent of 200 men who were armed by the British Government. In 1835, the old chief died, and his son and successor was wanting in a just appreciation of the strength of the suzerain power. A dispute arose between him and the Bor Senapati or ruler of Matak, with regard to some land near Saikhoa south of the Brahmaputra. The British officer attached the territory in dispute, pending his decision in the matter, but his orders were openly disregarded by the Khamti chief, who took forcible possession of the land he claimed. It was impossible to overlook such flagrant insubordination: he was deposed and deported lower

down the river, his post abolished, and Sadiya brought directly under the administration of the Company. A few years later, the ex-chief was rather rashly allowed to return and live amongst his people, and he at once proceeded to engage himself in intrigues against the British Government. In 1839 the plot bore fruit, and on the night of January 19th, a party of 500 Khamtis raided the station, murdered Col. White the political officer, and killed and wounded eighty of his men. But their courage failed them after delivering this attack, and they at once retreated into the Mishmi Hills. The Singphos, Mataks, and Abors all offered their assistance in quelling the revolt. Several expeditions were led into the hills; by December 1843, the last of the insurgents had submitted, and since that time they have never given any trouble.*

Matak

The rule of the Moamarias was entirely founded on the sword, but they undoubtedly succeeded in establishing their independence in a part of Lakhimpur. Coins are still extant which were minted by one of their Rajas Sarbananda; and, on the first arrival of the British, it was considered advisable to recognise the Matak Raja or Bor Senapati as a local chief. His jurisdiction was accordingly confirmed within the following boundaries: west and south the Buri Dihing, north the Brahmaputra, the Dibru river and its tributary the Dangori, and east an imaginary line drawn from a point south of Saikhoa to the Dehing. The territory was known as Matak, possibly because it was originally inhabited by members

*Vide History of the relations of the Government with the Hill tribes of the North-East Frontier of Bengal. By Mr. (afterwards Sir) Alexander Mackenzie P. 57-60.

of the Matak tribe. According to Wilcox, the Matak were a distinct tribe whose language bore no affinity to that of their neighbours, who lived on the Hupong plain near the Dihing river, south of the Phungan pass. They said that they had been conquered by the Singphos, that one half of them had been carried into captivity, and that the rest fled to the protection of the Khamtis. In 1826, there were about 500 houses of Matak in Bor Khamti, but, at the time of Major Macgregor's visit in 1885, they had become merged in the general population.*

It was arranged that the Bor Senapati should furnish a contingent of 300 men, and, though he was to pay no revenue himself, he was to be responsible for the poll tax of any raiyats who might migrate from British territory into his dominions. He was permitted to exercise civil and criminal jurisdiction over petty cases, but cases of murder, decoity, 'great wounding' and theft of sums, exceeding Rs. 50 were to be referred to the Political Agent for disposal. In practice this arrangement proved unsatisfactory. The rates of revenue charged were lower than those prevailing in the neighbouring territory, and there was a constant flow of settlers from the districts entrusted to Purandar Singh. In 1835, the liability to military service was commuted to an annual payment of Rs. 1,800, and in 1839, when the old Senapati died, the terms offered to his son were not sufficiently attractive to induce him to accept them. Matak was accordingly

* Account of Col. Woodthorp's expedition up the Dihing and into Bor Khamti in 1884-85 P. 8.

absorbed into the territories of the Company and administered like the other districts of Assam.

Purandar
Singh's ter-
ritory.

Reference has been already made to the hesitation with which the East India Company undertook the administration of Assam ; and, in 1833, the experiment was tried of placing the portion of the valley lying between the Dhansiri and the Dihing south of the Brahmaputra, and between Bishnath and Sadiya on the north bank, under Raja Purandar Singh. The Raja was accorded the position of a protected prince, was entrusted with full civil powers, and was required to pay an annual tribute of Rs. 50,000 to Government. It was thought that this arrangement would prove acceptable to the Assamese, but experience showed that, this was not the case. In 1838, Captain Jenkins, Agent to the Governor-General on the North-East Frontier, travelled through the Raja's territories, and was met on every side by complaints and charges against his administration. North of the Brahmaputra, the country was left unprotected, and the people were harried by the Daffas, who carried off their women and children and held them to ransom. Small guards of sepoys were occasionally sent to protect the frontier, but as the villagers were expected to provide them with all that they required, their presence and absence alike were felt to be a grievance. The distasteful system of compulsory labour was still maintained ; duties of as much as one anna in the rupee were levied on everything except rice sold in the markets, and the people who remained were required to pay the poll tax of

others who had died or had migrated to the territory directly under our administration.

There can be little doubt that Purandar Singh's administration was unpopular with every section of the community, but the Raja was to some extent hampered by want of funds. Major White estimated that the revenue of his territories amounted to about Rs. 80,000.* Of this, no less than half a lakh was ear-marked as tribute, and the Raja was left with a nominal Rs. 30,000 per annum from which to defray the expenses of his court, to satisfy the demands of the priests, and to carry on the business of the administration. It is hardly matter for surprise that little was spent on public works, that the army was small and inefficient, and that it was impossible to remit taxation. The natural tendency of mankind to cavil at the Government seems to have been over-looked, and too much importance was attached to every murmur of complaint. The Muhammeden settlers in the country professed that they had serious grievances, yet Captain Jenkins was himself constrained to admit that those who came to see him were far better dressed than he expected, and that, judging by externals, many of them were well off. There can, however, be little doubt that the resumption of this territory, in 1838, was an act which met with hearty

* Letter No. 80 dated 6th July 1838 from Capt. Jenkins.

A letter from Purandar Singh's son states that, when his father accepted the Raj, he had no idea what a large proportion Rs 50,000 bore to the total revenues of the country. Col. Cooper he says had made a settlement for Rs 170,000, but neither he nor any of the British officers who succeeded him could collect more than Rs 70,000 or 80,000.

approval from the great majority of the persons affected, and on that account alone it was certainly not to be regretted

The frontier
tribes.
The
Singphos.

Apart from the economic development of the district, the history of Lakhimpur, since it came under British rule, is largely concerned with the misdemeanours of the frontier tribes. In the early days of British rule, the Singphos, like the Khamtis, were a source of trouble on the eastern frontier. In 1825, they made common cause with the Burmese, and Capt. Neufville advanced up the Noa Dihing, destroyed their villages, and released a large number of Assamese whom they had kept as slaves. They occupied a debatable land on the extreme frontier of the district, and, for some time, it was doubtful whether they should or should not be treated as British subjects. Their two principal leaders were the Bisa and the Duffa *gam*, and the rivalry between these chiefs had the effect of keeping the south eastern frontier in a perpetual condition of unrest. In 1830, a raid was made on Sadiya, but was repulsed without much difficulty. Five years later, the Duffa *gam* descended from the Patkai, raided Bisa's village and killed ninety persons, and troops had to be despatched to drive him back into the hills. In 1837, Captain Hannay and Dr. Griffiths proceeded across the Patkai to meet the Burmese representatives, in the hope of being able to arrange with them some definite system for the management of the Duffa *gam*; but the Burmese claims were so unreasonable that it was impossible even to take them into consideration. In 1843, the Singphos

broke out again, and an attack was made on our posts at Ningroo and Bisa. An expedition was sent against the marauders without delay; all resistance was definitely crushed, and since that date the tribe has given practically no trouble. A quasi political murder occurred, however, in 1898. The Buri Dihing mauzadar had reported that the village of Jauhing *gam*, the Bisa Raja, might be assessed to land revenue. The suggestion was accepted by the Deputy Commissioner, and a Doaniya, a class of people whom the Singphos look upon as slaves, was ordered to measure up his land. This Jauhing *gam* resented. A short time afterwards the mauzadar was shot, and suspicion rested on a man of Jauhing's village. Attempts were made to obtain the surrender of the culprit, but he was reported to have escaped, and he has up to date succeeded in evading justice. As a punishment for this outrage, the order for assessment, which up to that time had been allowed to remain in abeyance, was at once enforced, and revenue has since been collected without trouble.

The country north of the Khamtis and Singphos is inhabited by the Mishmis, who are divided into three tribes; the Digarus who occupy the hills north of the Brahmaputra and east of Sadiya, the Chulikatta who live on both sides of the Dibang, and the Bebejiya who occupy the valleys of the Ithan and the Ithu, to the north-east of the Chulikatta country. The story of our relations with this tribe, down to 1884-85, will be found in the History of the North-East Frontier of Bengal by Mr. (afterwards Sir) Alexander Mackenzie,

**The
Mishmis.**

and is briefly summarized below. The first mention of the Mishmis in the records of the Bengal Secretariat dates from 1825, when Lieutenant Burlton reported that the "Mishmah" hills were inhabited by tribes "who were very averse to receive strangers." It seems, however, to have been possible to overcome these inhospitable tendencies, as in 1827, the Digaru Mishmis were visited by Lieutenant Wilcox, and in 1836 Dr. Griffiths entered the Mishmi Hills. Nine years later, Lieutenant Rowlatt penetrated to the Du, and up that river in a northerly direction to the village of Tupang, where he met the Thibetans.

**Murder of
M. Krick.**

at Rima

In 1851, M. Krick, a French missionary passed through the Mishmi Hills to the upper valley of the Luhit or Brahmaputra, and returned again without encountering any opposition. Three years later, he paid a second visit to the hills; but on this occasion he was not so fortunate and was murdered by a Mishmi chief named Kaiesha. It was not for long, however, that the murderer was allowed to go unpunished. Lieutenant Eden, at the head of sixty men, advanced eight marches into the hills, surprised and captured the offending village, and carried off Kaiesha to be solemnly hanged at Dibrugarh.

**Further out-
rages: then
peace for 20
years.**

In spite of this demonstration of our power to punish those who offended us even in the midst of their mountain fastnesses, the Chulikatta showed no inclination to respect our frontier. In 1855, they had the effrontery to carry off three servants belonging to Lieutenant Eden, and, towards the close of the year, they

attacked a village near Sadiya and killed two of its inhabitants. Two years later they cut up a village in close proximity to the sepoy lines at Sadiya, and steps were taken for the organization of a punitive expedition; but, in consequence of the outbreak of the Mutiny, it had to be abandoned. Further raids followed, and the experiment was then tried of supplying arms to the Khamti settlers on the frontier, with the idea that they would form a screen against the aggressions of the Mishmis. The experiment proved to be a complete success, and for twenty years the peace of the frontier was undisturbed as far as the Mishmis were concerned. In the cold weather of 1878-79, the Bebejiyas committed two small raids into the plains and murdered two Khamtis and two Assamese; and, though a party of frontier police was promptly sent out in pursuit, they had to return without seeing anything of the hill men.

In 1885, a British subject was murdered at Dikrang, his death, so rumour reported, being indirectly due to an attempt made to tame the savage hillmen by showing them the might and majesty of civilization, or so much of it as is represented in Calcutta. The headman of the Medakhel was taken to the Calcutta Exhibition, and on his return incontinently took to his bed and died. The British Government, sad to say, was held responsible for this unfortunate event. It was accordingly decided that a *sarkari* head must be buried with the body of the travelled Mishmi, to propitiate his spirit, and the nearest head available was forthwith taken. A blockade was at once proclaimed against the Chulikatta Mishmis, and

Unfortunate
consequences
of a visit
to Calcutta.

they were excluded from our markets, but as they were still able to obtain supplies from the neighbouring hill-men who were allowed to come to Sadiya, the blockade was not effective. In 1887-88, the matter was settled by the payment of a fine of Rs. 2,000, and the blockade was raised, as there seemed to be little hope that even if it were continued it would lead to the surrender of the culprits.

**Expedition
of 1899-1900.**

In 1894, the Mishmis were included in the blockade that was declared after the conclusion of the Abor expedition, as they were believed to have given the Abors their countenance and support, but they were once more admitted to our markets in 1897-98. In May 1899, a party of Bebejiyas attacked the small Khamti hamlet of Mitaigaon, killed two adults, wounded two others, one of them mortally, and carried off three guns and three children. An expedition was despatched in the following December, which succeeded in rescuing the captives and recovering one gun. There was no fighting and practically no opposition; but the natural difficulties of the country were immense, and steep passes rising to 8,000 feet in elevation, dense forests, cold, snow, sleet, and rain were obstacles which prevented the advance of the troops, and circumscribed their operations. The total strength of the Bebejiya tribe is estimated at between 3,000 and 4,000 souls living in 31 villages, and the territory occupied by them at less than 500 square miles. The Mishmis trade in musk, Mishmi *teeta*, a febrifuge much valued on the frontier, wax, dyed coats, baskets, skins, and swords

which they have obtained by barter from Thibet. An account of the manners and customs of the tribe will be found in Dalton's *Ethnology of Bengal*, which has been reproduced in a slightly abridged form in the *Statistical Account of Assam* by Sir William Hunter Vol. 1. p. 322-332, so that no further reference to the subject is necessary here.

During the last forty years, the Mishmis have not, on the whole, given the authorities much trouble; and during that period, they were only responsible for four murderous raids, in which eight persons lost their lives. This for a savage tribe is a comparatively good record, and there are at present no signs of any feeling of unrest on this portion of the frontier. A trifling restriction has, however, been imposed upon the Digarus. The men of this tribe are keen rubber tappers, and it has been found necessary to forbid them crossing the Brahmaputra and entering British territory from the south side of that river, as they try, whenever they can, to tap the trees in the Government forests and pass the product off as rubber brought from their hills.

West of the Mishmis come the Abors, though The Abors. this is a term which means nothing more than foreigner or savage, the *βαρβαρος* of the Greeks, and is somewhat loosely applied to the tribes inhabiting the hills between the Dibang and the Subansiri. The most important section of this tribe are the Padam or Bor Abors, who occupy the country lying between the Dibang and the Dihang. West of them come the Passi

Meyong Abors, and further west again less warlike tribes who are known as Gallongs, or Dobas, or Kurkur-khoa, or Mantaram Abors. An excellent description of the manners and customs of the Abors and of their villages has been published by Colonel Dalton in his *Ethnology of Bengal*, and has been reproduced in an abridged form by Sir William Hunter in his *Statistical Account of Assam* vol. I p. 333-342 so that further reference to this subject here would be superfluous.

The story of our relations with these savages down to the year 1884-85, is told in the *North-East Frontier of Bengal* by Sir A. Mackenzie, and it is unnecessary here to do more than briefly summarize this period of their history.

Of recent years the Padam or Bor Abors have been distinguished by their independent, not to say insolent bearing; but strangely enough the Abors are described in early correspondence as "far the best disposed of the hill tribes, though the most powerful, and never known to commit an act of unprovoked ravage or outrage on the villages of the plains." In support of this favourable judgment, it must be admitted that in 1826, they allowed Bedford and Wilcox to pay a friendly visit to their villages, while in 1840, they rendered assistance in the suppression of the rising of the Khamtis.

Collision
with Abors
in 1848.

The first collision with the Abors occurred in 1848, when Captain Vetch entered the hills inhabited by the Dobas, to demand the restoration of a body of Kaehari gold washers who had been carried off by

them. The captives were surrendered, but the camp was attacked at night, and the assailants only beaten off after hard fighting. Captain Vetch then burnt the village as a punishment for this piece of treachery and withdrew, without meeting with further opposition to the plains.

No further trouble was experienced for some years, and in 1855 Capt. Dalton paid a visit to the Abor village of Membo, but in 1858, a serious raid was made upon the plains. The Bihia village of Sengajan, only six miles north of Dibrugarh, was suddenly attacked and the inhabitants massacred, to punish them for having dared to move their village and deny the Abors the tribute they had formerly conceded to them.

Abortive ex-
pedition of
1858.

It was ascertained that men from the Kebang village of the Meyong tribe were the perpetrators of this outrage, and an attempt was made to follow up the raiders into the hills. The idea no doubt was excellent, but it was badly carried out. The troops did not succeed either in overtaking the Abors or reaching Kebang, and it was indeed with difficulty and some loss of credit to those in command that they got back to Dibrugarh. Arrangements were then made for the despatch of a larger force, but this too met with but a scant measure of success. The advance base was fixed at Rutumi, and the actual striking column only numbered 91 officers and men. The arrangements for the supply of provisions were defective, and the column was compelled to retire upon its base, after losing one European and three native soldiers besides coolies, without even having

reached Kebang. Too much confidence appears to have been placed in the friendly professions of the Abors inhabiting the outer range, who were most submissive to the advancing column, but, after it had passed, ambushed and killed the coolies bringing up supplies. It is seldom safe to trust to the friendly professions of the hillmen, when an expedition is in progress, yet strangely enough this very same mistake was made in the Abor expedition of 1893-94.

The expedition of 1859.

Emboldened by the failure of our soldiers to reach their villages, the Abors began to assume a still more truculent attitude. They advanced their outposts further down towards the plains, and it was evident that strong measures were required, if the outlying portions of the district were to be protected from their raids. Accordingly in 1859, an expedition was despatched which numbered in all 374 officers and men, with two 12-pounder howitzers and two mortars. The villages of Passi and Kinkong were stormed and burnt, but the enemy offered an obstinate resistance, holding no less than nine of the eleven stockades with which Passi had been fortified, and killing one of our men and wounding forty-four.

Raids in 1861 and subsequent submission.

The Passis then submitted, but the Meyongs continued to be hostile, and in 1861, cut up a Bihia village situated on the south bank of the Brahmaputra, only 15 miles from Dibrugarh. Government then decided to establish a chain of forts along the frontier, when the Abors, overawed by this display of energy, came in to make their peace. In 1862 and the following year, various sections of the tribe entered into agreements

with the Deputy Commissioner, and were promised small allowances of iron hoes, salt, tobacco, rum, and opium so long as they remained of good behaviour. These agreements were loyally observed for several years, but the tribe on more than one occasion gave evidence of their jealous and intractable disposition. The Membo Abors for example in 1863, went off in a temper and refused to take their presents, because the Deputy Commissioner declined to allow them to treat him with impertinent familiarity; and in 1865, the Meyong Abors absented themselves, because they resented the fact that the price of salt had risen in Sadiya bazar. In 1866, the Bor Abors came down to meet the Deputy Commissioner, and entered into agreements like the rest, a fact which no doubt produced a good impression upon the other members of the tribe. Ten years later, the Trigonometrical Survey Party entered the hills, but the tribes showed signs of unrest and evidently regarded their advent with suspicion, and it was accordingly thought advisable to discontinue the operations.

At the end of 1884, Mr. Needham, the Assistant Political officer at Sadiya, visited the villages of Membo, Gina, Romkong, Balek, and Monku, and every where met with a hospitable reception. In the following year, he visited the Bor Abor villages of Padu, Kumku, and Silli; and at the begining of 1886, he returned to Membo with the object of throwing a suspension bridge accross the Siku. But though the Abor shad themselves asked for the erection of this bridge, they declined to allow the work to be carried out, alleging, as an excuse, the insufficiency of the

Mr. Needham visits the hills 1884-1886.

materials, though in reality they were influenced by distrust of the motives of the Government. On the occasion of these visits, the hillmen discussed with Mr. Needham the grievances which they professed to have against the Government, most of which were, however, of a somewhat frivolous description. They objected to the establishment of outposts near the hills, and to the orders prohibiting them from coming armed to Sadiya. They complained that the allowances paid to them were insufficient, that runaway slaves who had succeeded in escaping into our territory were not returned, and finally, a source of irritation that was easily removed, that the Mishmis had better accommodation provided for them when they visited Sadiya. The results of these visits were considered to be satisfactory. The Abors had not been visited since 1855, and it was thought that these tours conduced to a better understanding with the hill-men. At the same time, in the opinion of the Chief Commissioner, certain elements of difficulty and possible danger had been brought to light. Such was the confidence of these savages in their ability either to institute or repel attacks, that he was inclined to doubt whether any course of amenity or justice would have a beneficial effect, till they had been compelled to recognise the overwhelming strength of the British Government. In writing in this strain he sounded a note of warning, unfortunately fully justified by the subsequent conduct of the tribe.

**Increasing
Insolence of
the Abors
1887-189..**

In 1887, the Abors abducted a Miri who had crossed the Inner Line without obtaining a pass, but the man

escaped, and two other minor acts of aggression were adjusted without difficulty. Two years later a much more serious outrage was committed. Four Miris were decoyed across the Inner Line by men from the Meyong villages of Yomsing and Ledum, and then cruelly put to death. A blockade of the Passi-Meyong country was forthwith established, by posting guards at Kathalguri, Dipimukh, Hilonimur, and Pobamukh, and so great was the inconvenience caused, that the powerful village of Kebang compelled the offending communities to send in apologies with a propitiatory offering of sixteen mithun (*bos frontalis*). The fine and apology were accepted and nothing more was done, but the Bor Abors as well as the Meyongs showed signs of giving trouble. In 1889, they seized some mithun which were being taken by the Mishmis along the Bomjur road, on the ground that the Mishmis had no right to trade with us direct, but released them on receipt of a remonstrance from the Assistant Political Officer. In 1891–92 and 1892–93 the Abors from Damroh, the largest and most powerful of the Bor Abor villages, failed to attend and draw their allowances at Sadiya, and, in November 1893, their veiled hostility broke out in open violence. On the 27th of that month three military police sepoy, who were patrolling between Bomjur and Kerimpani, were murdered in British territory and their rifles carried off. Less than a month later, a second attack was made on a patrol of seven sepoy, three miles south of Kerimpani, and one of them was killed and another wounded before their assailants could be beaten off.

**The Abor
expedition of
1893-94.**

Such insolent violation of our territory could only be adequately punished by an expedition, and in view of the difficulties experienced in the past, it was decided that the force should consist of not less than 500 men, 100 of whom were regular sepoys, and the remainder military police. Bomjur was occupied without resistance on January 15th 1894, and after leaving 100 men to guard the base, the rest of the force advanced on January 20th to Dambuk, a powerful village twelve miles distant from Bomjur. The Abors opposed this force almost from the very outset, and it was ultimately stopped by a huge stockade of trees, on which the mountain guns made no impression, and which was subsequently found to be 1,800 yards in length. The stockade was, however, captured with a loss of three men killed and twenty-seven wounded, and on the following day Dambuk was occupied, the inhabitants having fled. Sipu and Silluk were then visited, the stockades erected to bar our passage captured, and, though the Abors rushed the baggage coolies, they only succeeded in killing and wounding eight, and were driven off after leaving ten of their own party dead.

**The advance
on Damroh.**

It was then decided to punish the Damroh group of villages for having sent men to oppose our advance on Dambuk and Silluk. Membo and Padu were occupied in February, but, as they offered no resistance, were not destroyed, and preparations were then made for the advance on Damroh. Owing to difficulties of carriage, it was decided to leave the bulk of the rations at Bordak, under the charge of the *gam* or Abor chiy

of Gina and the *gam* of Padu, together with a small detachment of sick and weakly fighting men and a few followers. The rest of the force proceeded to advance to Silli, Dukku, and lastly to a camp on the Yamne river. On the Yamne the Abors again began to display a hostile attitude, and Lieutenant East was wounded by an arrow; but his escort managed to kill three of the enemy before they succeeded in making their escape into the jungle. On February 27th, Mr. Needham determined to leave one hundred men to guard the camp at Yamne, and to attempt to reach Damroh with the remainder of his force. Great difficulty was, however, experienced in discovering the path, and as at 2 P.M. Damroh was still invisible, he reluctantly decided to return. In the evening a *gam* from Dukku came in to say that he had been sent from Damroh to sue for peace, and Mr. Needham promised to receive a deputation on the following day, but, though he waited for it, none appeared. Information was then received to the effect that the villages which had already submitted had determined to oppose the return of the force, as it was thought that they would be short of ammunition, and fears began to be entertained for the safety of the detachment at Bordak.

The return march was accordingly begun, and on reaching Bordak on March 4th, it was seen that these fears were unfortunately only too well founded. The camp was gutted, the rations removed or destroyed, and the unfortunate sepoy and followers were stretched lifeless on the ground. A follower who had succeeded

The return march and massacre at Bordak.

in escaping and swimming to the opposite bank of the river, stated that some two or three hundred Abor coolies had come into the camp with the ostensible object of taking on the rations. As the sepoy and followers were carrying the stores out of the godown, they were suddenly set upon by the Abors and cut down; the total loss amounting to a subadar, a havildar, fourteen sepoy, and nineteen followers. As a punishment for this piece of treachery, the villages of Kumku, Padu, and Membo were destroyed, and the force finally reached Sadiya on March 14th.

The results of the expedition were summarised as follows in the report.

“The expedition on the whole has been eminently successful. We have taught the Abors a severe lesson. We have destroyed the villages concerned in the murder of our patrols, and all other villages that opposed us in any way. We have caused the Abors considerable loss in killed and wounded, and much property has been destroyed. We have shown them that their mountainous country can be traversed by us, that we can visit any of their villages, and that their strongest stockades cannot stop us. Our only misfortune has been the massacre at Bordak, and this was owing to treachery.”

Blockade
imposed on
Bor Abors
and Passi
Meyongs.

The hill men were still in possession of several of our rifles and of property looted at Bordak, and a blockade was accordingly proclaimed against all the tribes living north of Sadiya and on the left bank of the Dihang.

The payment of *posa** to these villages was discontinued, and the inhabitants of Bomjur were prohibited from rebuilding their village on the former site. The last named order was treated with absolute contempt, and as the Abors did not remove the houses they had re-erected when called upon to do so, they were burnt by the Assistant Political Officer in March 1895. Even this was not enough to teach them that we were in earnest. They once more began rebuilding, and, when Mr. Needham visited Bomjur some nine months later, he found 23 new houses there, which again he had to burn. After this second visit the Bomjur Abors realized that the orders of the Government of India in a matter of this kind could not be disregarded with impunity, and the village was definitely removed to a site a little further up the river. The results of the blockade were eminently satisfactory. During 1894 most of the rifles were returned, and, though some of the stolen property still was missing, the Abors in 1895 brought in a large boat and nine mithun in its place. In 1896, the blockade against the Passi Meyongs was raised, as it had only been imposed from fear lest the Bor Abors might supply themselves with salt and other articles they required, through the agency of their kinsmen. The blockade against the Bor Abors was maintained till 1900.

In 1897, the Passi Meyongs, urged on by that vague impulse which for centuries has been sending successive Movement
of the Abors
into the
Plains.

* *Posa* is an allowance given to hill tribes, generally in lieu of certain rights to levy taxes from the submontane tracts to which they established a claim in the days of native rule.

waves of immigrants from the hills into the valley of the Brahmaputra, began to settle in the plains; but, when called upon to pay poll tax, demurred on the ground that the land which they were occupying lay outside the Inner Line. The objection was, however, withdrawn after they had been visited by Mr. Needham, and they were clearly warned that British territory extended up to the foot of the hills. In the same year some Bor Abors settled in the plains on the left bank of the Dihang, north of the Sibiya river. They too claimed the land as outside the Inner Line, but as they had come there without leave, they were ordered to withdraw, and on their failing to do so, the village was incontinently burnt. In 1901, it was found that about 50 families had settled on the Dihang above Sibiya-mukh; and it was decided that as the blockade had been raised, they might be allowed to remain, provided that they did not attempt to move south of Sibiya-mukh, that they were of good behaviour, and that they paid poll tax as an admission of the fact that they were in British territory. No trouble has as yet been experienced from this colony.

The Passi Meyongs. After the blockade of the Passi Meyongs was raised in 1896, they began to trade with Dibrugarh in preference to Sadiya. It was considered that this was undesirable, as they ceased to come under the influence of the Assistant Political Officer, and in 1901, orders were issued prohibiting them from visiting Dibrugarh, but in many instances they were evaded. This tribe prefers a claim to the country lying between their hills and the Inner Line,

and occasionally attempts to assert its title by levying blackmail on timber cutters, fishermen, and others. Government has, however, continuously laid down that British territory extends right up to the foot of the hills, and that the Inner Line has only been laid down for the purposes of administrative convenience.

The Doba Abors have never within recent years been a serious source of anxiety to the Government. They come down to Sisi and Dibrugarh, and, as they were said to harass the raiyats in the Sisi and Dhemaji mauzas, a police station and guard were located at Kathalguri about six miles west of Sisi in 1889. Subsequently the guard was removed to Sisi, and the thana to Dhemaji. In 1903, the Mantaram and Sarusaku Gallongs raided the Jaktoli village in the Dhemaji mauza, looted four houses, carried off two girls, and injured several people. It was found that the raid was due to the dishonest conduct of Tatum, a Sarusaku gam, who had misappropriated money due to the offending parties. The two girls and most of the stolen property were soon brought in, the raiders were punished with a fine, and the dishonest gam was confined for a year as a political dētenu in the jail at Dibrugarh.

The hills to the west of the Abor country are inhabited by the Miris, who are divided into four main sections; the Ghasi Miris who live east of the Subansiri, the Saraks who live on the right bank of that river, and the Panibotias and Tarbotias who inhabit the country further to the west.

The Miris appear to have been employed by the Ahoms as soldiers, and their services were no doubt of value when expeditions were sent across the Assam range; but they seem to be naturally of a very peaceful disposition, and no tribes on the frontier have caused less embarrassment to the British Government. It has never been necessary to send an expedition into their mountain fastnesses, and they have shewn their appreciation of a settled form of Government by migrating in considerable numbers to the plains. Murderous raids are practically unknown, and, though they have occasionally carried off people from British territory to emphasize their grievances, no difficulty has ever been experienced in recovering the captives.

The Daflas. In the hills to the west of the district live the Daflas, a tribe who have never given much trouble in Lakhimpur. Such complications as have from time to time arisen, were generally due to quarrels between the hillmen and the Daflas who have settled in the plains.

Raid in 1887. One of these cases occurred in October 1887, when a party of hillmen raided the settlement of Taranggam on the west bank of the Dikrang river, about three quarters of a mile from the Harmati garden. Fifteen persons in all were carried away, and Tarang, with his brother and wife, were killed. This was not, however, a case in which it was thought necessary for Government to interfere. There seemed little doubt that Tarang had drawn down this summary vengeance on himself, by the oppressive and arbitrary treatment to which he had subjected several of the hillmen when

passing by his village; and only a month before the raid, he had been warned by the Assistant Commissioner of the probable consequences of his actions, and advised to move further from the hills. The raid took place just beyond the Inner Line, a fact of which the hillmen seem to have been well-aware, and the Chief Commissioner did not consider it necessary to intervene in this domestic feud. The most disturbing factors, amongst the Daflas adjoining Lakhimpur, are two *gams* in the Dikrang Valley called Muji and Chiring. In the winter of 1893-94, these *gams* seized some plain Daflas who had gone up to the hills, and it was found necessary to detain some of Muji's people in the plains, before he could be induced to return the captives.

In February 1899, a rather curious incident occurred, which shows how strong is the desire amongst these hill people to keep up their population. In these small communities the balance of power is easily affected by a slight increase in the death rate, and every person counts. This no doubt had much to do with the development of the law, so common on the frontier, that life should be taken for life in intertribal warfare. On this particular occasion, it appears that Chengmara, the village of a *gam* called Pareng, had been raided by hill men from the Dikrang. Pareng thereupon descended to the plains, and after enlisting in his service some Daflas from the village of Katoni near the north trunk road, attacked a party of hill men from the Poma Pani, who happened to be stopping in the neighbourhood. Pareng had no previous quarrel with these

A Dafla
press gang
in 1899.

people, and seems to have been solely actuated by the desire of increasing the population of his village, but in the course of the affray three men were injured and four were carried off. The Police however, were promptly on the spot, the captives were recovered, and Pareng convicted and sentenced to two years rigorous imprisonment.

The Ankas
or Apatan-
nangs.

The Ankas or Apatanangs, as they are sometimes called, are closely akin to the Daflas, and occupy a fertile valley, lying to the north of the hills inhabited by that tribe. This valley is described by Mr. McCabe, who visited it in 1897, as a magnificent plateau, some ten miles in length, laid out in highly cultivated and artificially irrigated terraces, which are watered from the Kali river. To the force which had reached it after an arduous march over hills covered with dense forest, it seems to have appeared a veritable land of promise. The level of the plain was broken up by small isolated hillocks and low pine clad spurs; the stubble on the ground showed that there had been an abundant harvest, and primroses, violets, and wild strawberries recalled the meadows and woods of England.

Eight villages were situated amongst the rice fields in fairly close proximity to the hills.

hill country adapted to their needs and circumstances. This, however, has not prevented them from migrating to the plains and to levels in large numbers and cultivating more fertile soil which they find in existence of the plains by one of them. It is said that the Miris discovered had killed a bird, finding in its stomach grains of rice. Thereupon he, with others, watched carefully the flight of the birds, and proceeding in the direction where they flew came eventually to the rice-growing plains.

THEIR FOOD AND CLOTHING.

Formerly their chief food was the flesh of the animals they hunted and killed, and their clothing was made of the skins. The men wear a species of coat, composed of a strip of coloured cloth, the head put through a slit in the middle, and having a deep fringe at its end, reaching half-way down the thighs. Women have a coloured cloth wrapped round them reaching to the knee. They also wear in lieu of the above, which is chiefly in among those who live on the lower levels a short skirt, or rather band, of plaited bamboo work in decorative colours and designs. Baskets both sexes carry on their backs, supported by a band round the forehead of fine plaited bamboo, are made by themselves as also are the hats of similar material worn by the men. These sometimes have feathers, varying in number according to rank and qualifications of the wearer, as usual with most of the hill tribes on the frontier.

With dialectic differences the language of the Miris and the Abors is practically the same. In character the tribes are very different. The Miris are naturally a quiet, peaceable people whereas the Abors are headstrong and turbulent among themselves. They say of themselves that they are "as tigers, and two can dwell in one den." Their name in Ar means "independent."

the other hand, the inferiority of the Ankas in arms and physique reduces them to a comparatively low level as an aggressive power. They are smaller and of a less robust build than the Dafas, and their peculiar characteristic is the tail of plaited cane, which they habitually wear around their waists. In 1889, the valley of Hong was visited by Mr. Crowe of the Joyhing Tea Estate, who was on friendly terms with the hillmen on the frontier, and four years later this gentleman escorted Captain Dunne into their country. The German explorer Herr Von Ehlers entered the valley in 1895, but as he was not like Mr. Crowe, personally known to the people, he met with but an inhospitable reception, and was robbed and turned out into the fields. In 1896, a party of Ankas put up at the house of one Podu Miri near the Kadam Tea Estate, and when the family had peacefully lain down to sleep, killed Podu and his stepson, and carried away four captives. Three months later, a small expeditionary force was despatched into the hills, which reached the valley of Hong, rescued the prisoners, and punished the Ankas by compelling them to release six persons whom they had carried off a short time previously from a friendly

Dafle village.

ABORS AND MIRIS.

We have received from a correspondent who has resided for many years on the Assam frontier the following account of the Abors and Miri tribes :—

The country inhabited by the Abors is beyond that of the Miris, which tribe acts as a channel of communication between the Ab channel and the plains people, the name "Miri" meaning "a go-between." Although the tribes are quite distinct, they are very dependent on one another, and a considerable amount of trading is done between them. The Miris are by nature a lazy people, and are content to get many things from the Abors which they might easily produce themselves. Thus they obtain a dye, from the juice of a plant called "munjeet," which they use for their cloths and cane-work. Abors work in metals, from them the Miris obtain their cooking vessels their *dacos* (native swords), and the *Deo gun* (metal bells with inscriptions, used in certain religious rites. From the Miris the Abors obtain Assamese cloths, silks, rice, salt, other produce of the plains. Between the two tribes there is a good deal of exchange in slaves and of intermarriage, the latter being a mark of barter.

The religious theories of the Miris are very well defined, but they believe in a C Spirit who rules over the souls of those departed, and whom it is necessary to propitiate in this life, lest evil befall in a future state. Religion with them, as with most of the tribes consists mainly of propitiation rather than worship. They have, too, a belief that

Nagas.

exception of the Sarkari Nagas whose villages are situated north of the Tirap, live beyond the frontiers of the district. In the hills south of Jaipur live the Namsangias, and further south again the Borduarias; while some way to the east and south of the Tirap live the Rangpangs.

The Namsangias and Borduarias.

In 1884, it was estimated that the Namsangia tribe numbered about 6,000 souls, while the Borduarias were about 3,000 more; but the data are so imperfect that it is impossible to place much reliance on these estimates. The two tribes are at feud with one another, but do not, as a rule, carry their quarrels into British territory, though from time to time unpleasant incidents have taken place, which have necessitated the intervention of the British Government. A typical case occurred in 1888, when a party of Namsangia Nagas carried off six of their fellow tribesmen from the Dillih village, and put two of them to death. The Deputy Commissioner fined the Namsangia chiefs Rs. 1,000 and fifteen guns for this violation of our frontier. The Chief Commissioner considered this punishment to be quite inadequate, but he abstained from interfering with the decision of the local officer, as he was unwilling to do anything, which might possibly tend to weaken his authority.

Gradual extension of our influence over the hills.

The development of the coal mines near Margherita, and the opening of the Makum garden offered a fair field for the employment of Naga labour on jungle cutting and similar rough work, of which the hillmen were not slow to avail themselves: and, in 1893, one company had more than 2,000 Nagas, working at one time. They

caused, however, considerable annoyance by their petty thefts of cattle, iron implements, and similar articles; and in order to check these depredations, the strength of the guard at Ledo was raised in 1897 from 11 to 20 men, and an outpost of 10 men was stationed at Tikak. In 1902, these two outposts were abolished, and in their place one was established on the Lungchong Hill, a day's march south of Namdang, with the object of protecting a peaceful tribe of Nagas, who, in token of their submission to our authority, had assumed the title of Sarkari. Subsequently, in 1904, the Inner Line was thrown back to the Tirap, and the hills inhabited by these people were definitely incorporated in the district. There are few places where civilization and savagery are brought into closer proximity than at Margherita. A striking instance of this occurred in 1902, when two Nagas, who were peacefully walking along the railway in search of work, were kidnapped and carried off into the hills. One of them escaped, but the other was taken to the Yogli village, and when the captors were ordered to give him up, they replied that he was not a British subject, and that they proposed to use him as a human sacrifice. The Deputy Commissioner accordingly visited the place with a small escort, rescued the prisoner, and, as the people declined to come in and meet him, burnt the village.

No attempt is made to interfere with inter-tribal feuds beyond the Inner Line, but the chiefs of the Nam-sangia and Borduaria tribes have signed agreements to respect our territory, and to abstain from annoying

travellers using the paths leading to the plains. Few tribes beyond the frontier are more amenable to control. They speak Assamese, they have embraced the Hindu religion, and, as they earn large sums of money by trading or labouring in the plains, exclusion from our territory would, entail a heavy punishment. The Borduaria Raja holds 200 bighas* of land revenue free in the plains, while the Namsangia Raja is paid Rs. 450 a year on account of the Hukanjuri tea seed garden. There are thus ample means of bringing pressure on the tribe without entering their country, and the hills themselves are easy of access, and present no special difficulties to the advance of small bodies of men. They were visited by the Deputy Commissioner in 1901, and he recorded the following note upon the people and their customs.

**Description
of Namsan-
gia and Bor-
duaria. Na-
gas.**

These two tribes are our nearest neighbours on the Jaipur side. They are closely related and were originally no doubt one people. Now, however, they are on anything but good terms. The Borduarias are considerably the more powerful, but each has too wholesome a respect for the other power, to indulge in open warfare. For a long time the Namsangias had to recognise the superiority of the Borduarias, and, when an animal was killed by the former, a rib was given to the latter. This custom has now been discontinued, and the chief reason of the constant feuds is that the Borduarias still wish to be acknowledged as the paramount tribe, while the Namsangias claim equality.

I halted a day in the Borduaria village, and examined it with some care. The village proper contains some two hundred houses, and on each of the outlying spurs is a group of houses, which serves as an advanced post. The Borduarias assured me that they could them-

* A bigha is about one third of an acre.

selves put a thousand warriors in the field, and they are allied with other villages and tribes, such as the Kaimai, the Paniduarias, the Palongias, etc. The Borbanchangs are said to be more powerful than the Borduarias, and the Bormithunias are in alliance with the Namsangias. I am not aware on what information the strength of these Nagas, as given in Mackenzie's North-East Frontier, is based, but doubt the accuracy of the figures. Time did not permit of my visiting any other villages, and without doing so, no definite information can be had.

As regards religion, customs, and means of livelihood, the Borduarias and Namsangias can be taken together. They are Hindus now, adherents of one of the Sibsagar gosains. According to their own story, they have been Hindus from the earliest times, but in reality their conversion is probably of recent date. All enquiries on this subject proved fruitless. On our way down from the Borduaria village, we passed two separate spots, which Bor Dangariyas (friendly spirits) were believed to inhabit, and each Naga of our party piously threw his twig or leaf on the heaps that marked the places. Some of the other tribes are wholly or partly Hinduised, but on this point reports varied considerably.

The manufacture of salt is carried on to a very considerable extent. In the course of my tour I saw 15 or 16 primitive stills, and was informed that there are several others. The method of manufacture is as follows :—

Wells have been sunk at various places and lined with hollow tree trunks. From these water with a slightly saline taste is baled out and stored in rough bamboo vessels. Each well has close by one or more rude furnaces of baked clay, open at the top. The furnace is charged with fuel, the bamboo vessels are placed side by side across the opening, and a fire is maintained till the process of evaporation is complete and only salt crystals are left in the vessels. This salt the Nagas use, and trade both among themselves and with the people in the plains.

The poppy is cultivated further back in the hills. I saw none in the course of my tour, but was shown several poppy heads from which the juice had been extracted. It is possible that a certain amount of hill opium finds its way into our territories.

**Economic
development
of the
district.**

Apart from the troubles on the frontier, the history of Lakhimpur, since it came under British rule, is one of continuous expansion, for which it would be hard to find a parallel in any other rural district of India. In the last half of the nineteenth century the population increased nearly fivefold, and the settled area nearly six fold; an extraordinary development for a district in which there is only one town, and that a town with barely 11,000 inhabitants. These wonderful results have been obtained by the introduction of a settled form of Government, by the improvement of communications, and by the application of the magic wand of British capital to a healthy but sparsely populated district, with great natural resources.

**Lakhimpur
Assamese in
little more
than name.**

Some of the consequences of this development are perhaps a little curious. Lakhimpur the most remote and easterly portion of Assam, is Assamese in little more than name. Nowhere in the valley are there many Assamese of wealth, intelligence, and influence, but in no district are there fewer than in Lakhimpur. In this portion of the Province, capital and labour, enterprise and education, trade and crafts are all alike represented by the foreigner. Lakhimpur has in fact been "discovered" by the British. They found it a remote inhospitable jungle, inhabited by a rude and scanty population, who were at the mercy of the even ruder tribes who haunt the hills that surround it on three sides. They felled the forests and turned them into prosperous tea gardens, they imported labourers in thousands, whose requirements in grain and clothing

the Marwari merchants were not slow to fill; and thus it has come about that all the wealth and all the weight and influence in the district are in the hands of foreigners. In the Dibrugarh subdivision alone, there was a European population in 1901, of 431 souls, and in many essentials Dibrugarh might be regarded as no less English than Australia or the Cape. Amongst the native community, commerce and capital are centred in the merchants of Marwar, while the keen witted Bengali dominates the bar and occupies nearly all the posts for which special intelligence is required. The huge labour force of Lakhimpur is drawn from every portion of India except Assam,* and thousands of these industrious coolies have now settled down to cultivation, and are reaping the rich profits from agriculture which are despised or neglected by the Assamese. It must not, however, be supposed that the indigenous inhabitants have suffered from the advent of the foreigner. They have increased considerably in numbers, and, had there been no immigration, they would undoubtedly have been less affluent than they are at the present day. They have failed to take advantage of the extraordinary opportunities that have been offered to them, and they have obtained a comparatively small share of the great store of wealth that has been extracted from the district; but for this the tastes and inclinations of the people are to blame. The Assamese of Lakhimpur prefer, as a rule, indolence and opium to a strenuous and active life, and so long as they are dominated by these faineant ideals, it

* Not 3 per cent. of the labour force are indigenous inhabitants of Assam.

is idle to expect that they will make much progress along the path of material comfort.

**Exploration
beyond the
frontier.**

Neither on the north, east, or south, have the boundaries of the district ever been definitely laid down; and the story of the various attempts that have been made to penetrate the mysteries of the jungle covered mountains, that surround the plains of Lakhimpur, come thus within the four corners of our brief. Apart from the work done by the expeditions despatched against the Apatanangs, the Abors, and the Mishmis, exploration has mainly been carried on in three directions;—up the Brahmaputra eastward to the valley of Rima or the Zayul-Chu; into the Khamti territory in the south-east; and across the Patkai into the Hukong valley.

The following account of the various expeditions into the Zayul valley, prior to the one headed by Mr. Needham, is reproduced from some papers in the Secretariat*

**First
attempts
to penetrate
the Zayul
valley.**

“The existence of a route into Tibet, by the upper waters of the Brahmaputra, has been known to the Indian Government ever since the British occupation of Assam. A list of the stages from Sadiya, numbering twenty altogether, was obtained by Lieutenant Neufville in 1825, and published in the *Asiatic Researches*. In 1826 Captain Wilcox succeeded in advancing three quarters of the way to Rima, along the southern or left bank of the Brahmaputra, but was there stopped by the refusal of the Miju Mishmis to allow him to pass through their country. Ten years later, in October-November 1836, Dr. Griffiths followed the same route to a point about half way between Sadiya and Rima, and then crossed the Brahmaputra, and visited some Mishmi villages on the northern side; but he too, was deterred from attempting

* Letter No. 1194 dated the 21st June 1886 from the Secretary to the Chief Commissioner to the Secretary to the Government of India Foreign Department.

further progress, by the refusal of the easterly Mishmi chiefs to give him a safe conduct. Lieutenant E. A. Rowlatt, in November-December 1844, was the first explorer who took the route which Mr. Needham subsequently followed, along the right or north bank of the Brahmaputra. He got as far as the river Du (or Mdaun) within sixty miles of the Tibetan border, and turned back on being told that the intervening country was destitute of inhabitants, a state of things which does not exist, now whatever may have been the case sixty years ago. In 1851 the French missionary, M. Krick, succeeded in entering Tibet by the same route, and in returning to Assam with safety; and in 1854 he penetrated into the Zayul valley a second time, in the company of M. Bovry, but both the travellers were barbarously murdered by the Mishmi chief Kaisha. In December 1869 and January 1870, Mr. J. T. Cooper attempted the journey towards Tibet by the route along the southern or left bank of the Brahmaputra, but was prevented from proceeding by the refusal of the Miju chiefs to admit him into their country. His farthest point was several marches short of that attained by Wilcox in 1826. In 1879, the Khamti chief Chowsa, who accompanied Mr. Needham on his expedition, got as far as the borders of Zayul by the northerly route (Lieutenant Rowlatt's), but was prevented by the Tibetan authorities from entering the valley.

The route taken by Mr. Needham from Sadiya to Rima is estimated to be about 187 miles in length, and can be most easily considered, if divided into five sections. The first section from Sadiya to Tamemukh lies entirely in the plains, and is 46 miles in length. It runs for the most part up the bed of the Brahmaputra, or through the jungle on its banks, and a good cold weather track could probably be cleared without much difficulty. The second stage, 24 miles in length, to Chowsa's village, includes some rough marching over various ranges, the highest pass being 4,500 feet above the sea. The third stage of 17 miles to the Dalei river is rather difficult, and in one place the route usually

Mr.
Needham's
march in
1855-56.

followed by the Mishmis runs along the face of a precipice some two or three hundred feet above the Brahmaputra, in which there are merely a few niches in the rock to afford a precarious foot hold. A better path which is passable for cattle is, however, to be found higher up the cliff. The fourth section is 74 miles in length, and comprises the country traversed between the Dalei and the frontier of Zayul. Here too there was some difficult walking, and more than once the path consisted of little more than a few steps cut on the face of the cliff. The fifth stage of 26 miles from the border of Thibet to Rima presented no serious difficulties to the travellers. Above the Dalei, the valley of the Brahmaputra is about half a mile in breadth, and Mishmi villages in their small clearings in the jungle were not unfrequently to be seen. The river is crossed on cane hawsers which sag towards the centre. The traveller puts a loop of cane round the small of his back and in this way slides down to the centre of the rope, and then works his way with hands and feet up the further side. As these ropes are often suspended at some distance above the river, these bridges, for a person with sensitive nerves, leave much to be desired.

**Description
of Zayul
Valley.**

M. Krick is said to have described the valley of Zayul as a tract cultivated as far as the eye could reach, and abounding in herds of oxen, asses, horses, and mules, and in groves of bamboo, laurels, orange, citron, and peach trees. The Pandit A. K. who lived in Zayul from the 23rd May to the 9th July 1882, describes the winter crops as rice, millets, and pulses, and the spring crops as

wheat, barley, and mustard ; the domestic animals being oxen, half-bred yaks, horses, pigs, and fowls. Mr. Needham also found a good deal of terraced cultivation, but his description of the valley is couched in less glowing terms than those of his two predecessors, though, as he met with a far from hospitable reception, his opportunities for examining its resources were but small. The Mishmis trade with the inhabitants of Zayul, exchanging grass, bark, dye stuff, musk pods, and deer skins, for salt, cattle, woollen coats, metal vessels, swords, beads, silver amulets, and ammunition; but neither the Miju clan of Mishmis nor the Thibetans are allowed to trade directly with Assam. Little difficulty would, however, be experienced in constructing a practicable trade route, if on political or commercial grounds it was considered to be desirable to do so.*

South of the Brahmaputra, more than one expedition has gone to Putau the capital of the Bor Khamti country. The first officer to explore in this direction was Wilcox, who reached Bor Khamti in 1826, but for many years he had no followers. Of recent years three separate parties of explorers have visited the valley. Colonel Woodthorpe and Major Macgregor in 1884-85, and Mr. Errol Gray in 1892-93 entered Bor Khamti from Assam, while in 1895, Prince Henry of Orleans passed through it in the course of his journey from Tonkin to Calcutta. The first stage of the journey follows the Noa Dihing river for 67 miles and calls for little comment. The

**Expeditions
to Bor
Khamti.**

* Mr. Needham's diary of his journey will be found in Assam Secretariat File No. 1735 J. of 1886.

country is sparsely peopled with Khamtis and Singphos, but presents no special difficulties to the traveller. The path then runs up the Diyun valley as far as the Merit, a distance of about 45 miles. The country is, for the most part, covered with dense forest, haunted by elephant, rhinoceros, and other big game, and in places the going is extremely bad. After leaving the Diyun, the track crosses a pass 8,300 feet above the level of the sea, which in the winter time is often deep in snow. Two marches further on, the Makoshat mountain has to be crossed at a height of nearly 9,000 feet, but the path then sinks to the Phungma river which is less than 5,000 feet above sea level. From there it is three short marches to Langnu, which is situated at the southern end of the Bor Khamti valley about 1,500 feet above the sea.

**The Bor
Khamti
Valley.**

The Bor Khamti valley is said to be on the average about fifteen miles in width, though in places it is as much as twenty-five. The soil is very fertile and large crops of rice are raised which are stored in excellent granaries. Prince Henry of Orleans, though little predisposed in favour of the people, describes the place in glowing terms. As far as the eye could reach stretch rice fields, yellow as the plains of Lombardy. It is a splendid territory, fertile in soil and well watered, where tropical and temperate culture flourish side by side, and the inhabitants are protected on three fronts by mountains. The population was estimated by Mr. Gray to be about 11,000 souls, 3,000 of whom perhaps would be fighting men, living in 17 villages. The village of the Langnu Raja was surrounded by a double

palisade of planks interlaced with split bamboo. The houses were large commodious structures, raised on piles, and in the Raja's house there was a hall of audience, fifty feet long and proportionately wide. The people are in fact much more civilized than most of the tribes on the north-east frontier, and there is a temple in the valley, ninetyfive feet high, adorned with a gilded cupola, and with several statues of Buddha, some of which are carved from fine white marble.

But, if civilized, the Khamtis are most extortionate, and every chief and person of importance expected to receive a handsome present. More than one gun was handed over by both the British parties, and a considerable store of opium was expended. The people were willing to buy and sell, but it was only for a price. At Putau, the capital, Mr. Gray could obtain no firewood for his followers till he had bartered away some fifteen rupees worth of opium. He was anxious to ascertain whether he could not get through to China, but was informed that it was hardly practicable. The country was occupied by Khakus, a wild and savage people living in independant villages, each of which would demand a substantial sum for permission to pass through their territory. A really wealthy traveller, prepared to scatter opium and guns with both hands, might possibly get through, but for such a man there was serious risk of being robbed en route.

Mr. Gray was accordingly compelled to return along the path by which he came, and it was reserved for a Frenchman to be the first European to travel over land

Prince
Henry of
Orlean's
travels.

between China and Assam. In 1895, Prince Henry of Orleans started on his journey westward, from a place called Tsekou, on the upper waters of the Mekong. The initial stages of the journey were fairly easy, and as far as the Salween, the party found it possible to take their mules, but after crossing that river the path became only possible for men on foot. The people, however, offered no objections to the advance of the explorers; and they were willing to act as porters, and ready to sell food at reasonable prices. Between Deidoum and Mandoum, the path in many places is very bad. "Jagged points, slippery surfaces, crumbling brinks, creepers that tripped, worm eaten trunks up which to swarm, almost vertical ladders to climb, formed of wooden pickets driven into the face of over hanging bluffs, often hauled by sheer strength of a couple of men and liana drag ropes over boulders"—such is the description given by the gallant French explorer.

But the people, far from being the avaricious robbers depicted by the Khamtis, showed themselves far from unreasonable in their demands. Near Mandoum the offer of a spoon was sufficient to procure a competent guide, and all along the route, as far as the Khamti valley, comparatively little difficulty was experienced in obtaining food and porters at fairly moderate rates. The path, though bad in places, presented no insuperable obstacles, and though the travelling was rough, the existence of a friendly population largely facilitated the movements of the party. But in the Khamti valley everything was changed. At the first village they

were called upon for a present, a novel demand which had little to commend it. An offer of five rupees was met by a demand for one hundred, whereupon the party fell in, guns to the front, and the villagers quickly contented themselves with one tenth of the sum that they had originally asked. The conduct of these people was but of a piece with that of the other inhabitants of Bor Khamti. Every one demanded something, and, short of actual molestation, they behaved like actual brigands. Their treatment of Prince Henry does not seem to have materially differed from that accorded to the other parties sent from India; but how unlike it was to the conduct of the tribes inhabiting the territory between China and Bor Khamti is to be judged from the explorer's indignation and disgust. And these, forsooth, were the people who had told Mr. Gray that the blackmail levied between Bor Khamti and China would almost be prohibitive. It seems, in fact, to be fairly clear that the march from Bor Khamti to China is easier than the journey from Bor Khamti to Assam. The natural difficulties are not greater, if as great, and the whole question is much simplified by the existence of a number of villages from which supplies and porters can be obtained. At the same time, it is difficult to believe that this path could ever advantageously be opened up as a trade route. The distances are too great, the physical difficulties too serious, and, in Prince Henry's opinion, it has small chance of ever becoming an artery of commerce.*

* For further particulars see (1) Account of Col. Woodthorpe's expedition up the Dihing and into Bor Khamti, (2) Mr. Gray's diary printed in *F. A. Progs.*, May 1894, Nos. 7-15, (3) From Tonkin to India by Prince Henry D'Orleans.

The Patkai

For many centuries there has been communication between Lakhimpur and Burma over the Patkai Hills. It was by this route that the Ahoms entered Assam in the 13th century, and it was across the Patkai that the Burmese retired nearly 600 years later, when they were driven out of the Brahmaputra Valley by the British troops. The first European to cross this range was that eminent traveller Dr. Griffiths in the winter of 1836-37, but for many years he had no followers. In 1892, Mr. Needham crossed the hills to Maingkhwan, and there met an expedition which had advanced up the Hukong valley from Burma. In the cold weather of 1895-96, a reconnaissance survey was made for the purpose of estimating the cost of carrying a railway over the hills to Burma. The party marched *via* Ningrangnong and Namkri, to the summit of the Patkai, where their camp was pitched at about 4,000 feet above sea level. They then followed the Nongyong to its junction with the Loglai, went down that river till it fell into the Turung, and marched along the Turung into the Hukong valley. The party experienced no difficulties in this journey, but it was clear that the cost of carrying a railway over the hills would be extremely heavy. The Hukong valley is very fertile, but is sparsely peopled, and the long march over the hills is a serious obstacle to the development of much trade between Burma and Lakhimpur.

Archaeology
The ruins
near the
Dibang
gorge.

Some of the most interesting remains in the district are the ruins of two forts between the gorges of the Dikrang and the Dibang, about 24 miles north of Sadiya, which are assigned by tradition, the one to Bhismaka,

the other to Sisupal. The following description of these forts is taken from the *Calcutta Review*.*

“The extent of Sisupal’s fort”, observes Captain Rowlatt in his ‘Report of an Expedition into the Mishmi Hills,’ “is considerable, as it took me about four hours to walk along one side of its faces. The defence is double, consisting of a rampart of stiff red clay which, as the surrounding soil appears of a different nature, must have been brought from some distance. Below this rampart is a terrace of about twenty yards in breadth, beyond which the side of the hill is perpendicularly scarped and varies from ten to thirty feet high; the principal entrance and the defences for some distance on either side are built of bricks, and on many spots in the interior I observed remains of the same materials. The fort seems to be composed of three sides, the steepness of the hill at its north face precluding the necessity of any other work.”

“Raja Bishmukh’s fort stands about sixteen miles to the north-west of Sadiya, and occupies the high table-land at the foot of the hills between the rivers Dikrang and Dibang. It was visited in the year 1848 by Colonel S. F. Hannay, who thus describes it :—‘A high rampart of earth crossed the opening towards the plain. Crowning this, we found ourselves amongst bricks scattered about, with a low wall running along the top of the outer edge, which on nearer inspection proved to be an upper parapet overtopping the rampart, the lower portion showing a solid facing of hewn sandstone blocks of more or less height according to the nature of the ground. This rampart ran in a direction about north-west, and in the distance of a quarter of a mile which we inspected, the brick wall continued on the left, sometimes to the height of five feet, loop-holed in several places apparently for arrows and spears, but more frequently in a very dilapidated state from huge trees having taken root in the rampart, and wild animals passing over it. At the distance of a quarter of a mile, a spur of the table land touched upon the rampart and a brick wall crossed it, ascending the spur apparently to the level land above. Here also must have been a gateway or passage of some kind through the cross-wall, but all had

*Vol. XLV, Page 510, May 1867

disappeared in the heaps of bricks lying about. The wall and rampart, however, still continued to the north-west; but having little local information about the place, and being limited in our researches to that day only, it was considered advisable to return. We therefore confined our further observations to that portion of the works we had passed."

"The table-land to the east being naturally strong from the steepness and difficulty of ascent, required no artificial defences, and from the circumstance of the rampart and wall abutting upon the southernmost point of the table-land, it appeared to me evident that those works to their utmost extent westward—probably to the banks of the Dibang about four miles distant,—were merely intended to enclose the table-land at the foot of the hills, and thus form a place of refuge in time of invasion. No buildings are said to be on this hill fortification; but the Mishmis (the hill tribe occupying the adjacent heights) who describe it as of great extent, speak also of a gateway by a hill stream, where there are fragments of large earthenware vessels of various shapes, and the truth of this is confirmed by the numerous debris of earthen vessels found in the bed of the Dikrang river, of a description totally different from the manufactures of the present day in Assam, being more (as regards quality of material and shape) like that of the earthenware of Gangetic India."

"Although bearing the appearance of great age, for in many places the wall has bulged and fallen down, it has evidently been well and substantially built; the sandstone blocks, varying from 10 to 8 inches thick, a foot broad, and 20 inches long, are rudely but evenly chiselled with the point, and they are closely and regularly laid. The bricks are first-rate, varying in size from 8×5 to 6×4 inches, and from $1\frac{1}{4}$ to $2\frac{1}{2}$ inches thick, and the parapet wall formed of them about 4 or $4\frac{1}{2}$ feet in thickness. The sandstone facing of the rampart may be somewhat less, but the whole masonry work is laid without cement or fastening of any kind; immediately over the sandstone are two rows of bricks, and over these, two others projecting so as to form a rude cornice, which gives it an appearance of neatness. The rows or layers of masonry (sandstone) alternate from 5 to 7 and 9 from the bottom of the wall outside, a difference which may be accounted for either from

the natural steepness of the ground in some parts requiring less wall, or from the earth having accumulated against the wall from natural causes during a long period of time. Close to where the wall abuts against the table-land, there is a turn at right angles, given evidently to form a flank defence."

In 1873, four tanks were discovered in the same locality, one almost as large as the famous tank at Sibsagar, and the brick foundations of what must once have been extensive buildings.

The copper temple, at which the human sacrifices, described in the article on the Chutiyas, took place, stands on the banks of the Dhol river to the east of Sadiya. It is a small stone building with walls $4\frac{1}{2}$ feet thick, and an interior only 8 feet square, which stands in a large enclosure surrounded by a brick wall. The roof was originally sheathed with copper, most of which has now been removed.

There are the ruins of a small temple near the Phulbari village in the Narayanpur mauza. It is approached through a masonry arch, and consists of a small square building about 20 feet high, which is now in a very ruinous condition. Along the front there is a frieze of tiles, and in the neighbouring jungle are to be seen the stone images of several gods. The temple is said to have been erected in the days of Rajeswar Singh, and to have been destroyed by the Mataks. There are also the remains of three small temples near Sisi opposite Dibrugarh, but, like the building at Phulbari, they are in a very ruinous condition. In the valley of the Barpani, about two days journey

from the Harmati garden into the Daffa country, there are the ruins of an old city. Two brick walls, about one mile in length, run parallel to one another at a distance of about a mile apart. The site is covered with jungle and has never been properly explored.

CHRONOLOGICAL TABLE.

AHOM KINGS.		A. D.	
A. D.			
1228	Sukapha.	1204	Baktiar Khilji invades Assam.
1268	Sutenpha.	1220	Ghiyasud-din-Bahadur Shah advances to Sadiya but is defeated.
1281	Subinpha.		
1293	Sukangpha.	1256	Iktiyarud-din Yusbak Tughril Khan invades the Brahmaputra Valley but is ultimately defeated.
1332	Sukampha.		
1364	Sutupha-treacherously killed by Chutiyas at a regatta held on the Saffrai river to celebrate a cessation of hostilities between the two tribes.	1337	Muhammed Shah sends a force "of 100,000 horsemen" into Assam, all of whom perish.
1376-1380	Interregnum.		
1380	Sukemthi, a weak and tyrannical prince, assassinated by his ministers.		
1389-1398	Interregnum.		
1398	Sudangpha.		
1407	Siyangpha.		
1423	Suphukpha.		
1439	Susingpha-defeats Nagas.		
1468	Suhangpha-defeated by Kacharis in 1480, and murdered by a convict.		
1468	Supimpha, a cruel prince assassinated by his ministers.		
1467	Suhunmung alias Sarga Narayan or Dihingia Raja. Conquers Chutiyas and annexes their kingdom 1533. Repulses two Muhammadan invasions, the second being that under Turbuk in 1532, who was routed near the Bhareli river. Kills Kachari king and sacks Dimapur his capital in 1536. Assassinated 1539.		
1539	Sukhenmung-built Gargaon (Nasira).		
1553	Sukampha.		
1611	Suchengpha or Pratap Singh. Assists Bali Narayan against Musalmans, besieges Hajo but is driven back. Bar Nadi accepted as frontier between Muhammadans and Ahoms in 1637.	1500-1534	Viswa Singh—Founds Koch kingdom, advances against Ahoms but was apparently defeated.
1640	Surumpha. Deposed.	1534-1584	Nar Narayan-conquers Ahoms and occupies Gargaon circa 1563 A. D. Subdues Rajas of Cachar, Jaintia, Manipur Tipperah and Sylhet. Kala Pahar, invades Assam in 1553 and destroys temples at Kamakhya and Hajo.
1652	Suchingpha. Deposed.	1581-1598	Raghu Rai obtains share of Koch kingdom east of Sankoeb.
1654	Sutumla or Jaiyadwaj Singh. Ahoms occupy Goalpara 1658. Driven back by Mir Jumla who enters Gargaon 1661.	1593-1614	Parikshit-builds North Gauhati, quarrels with his cousin Lakahmi Narayan, calls in Muhammadans to his aid.
1663	Chakradwaj. Ahoms reoccupy Gauhati in 1667.	1614-1637	Bali Narayan—Invokes aid of Ahoms against Muhammadans. From this date the Koch kings cease to be of any political importance

CHRONOLOGICAL TABLE.—Continued.**AHOM KINGS.**

A. D.	
1670	Adayaditya Singh, assassinated.
1672	Suklumpha-poisoned. Musalmans reoccupy Gauhati.
1674	Suhung-assassinated.
1674	Teenkungiya-assassinated.
1674	Suhungpha-blinded and murdered.
1677	Sudinpha-assassinated.
1679	Sulekpha (Lora Raja) assassinated.
1681	Gadadhar Singh-Ahoms recover possession of Gauhati.
1686	Budra Singh—founds Rangpur, defeats Kachari and Jaintia Rajas, publicly adopts Hinduism as his religion. This period represents the height of the Ahom power. Dies at Gauhati.
1714	Sib Singh—a weak prince who resigned in favour of his wives. Excavated tank at Sibsagar.
1744	Pramatta Singh.
1751	Rajeswar Singh. Decline of Ahom power.
1769	Lakshmi Singh. Out-break of Moamarie rebellion—king deposed for a time, but subsequently reinstated.
1780	Gaurinath Singh. Driven to Gauhati by Moamarie. Reinstated by Captain Welsh in 1791, who is however, recalled in 1794. Krishna Narayan, Darrang Raja, asserts his independence in 1792, but is defeated by Captain Welsh.
1795	Kamaleeswar Singh. Deposes Krishna Narayan.
1809	Chandra Kanta Singh—Burmese are invited into Assam by Bor Phukan. Deposed 1816.
1816	Purandar Singh—Burmese again enter Assam. Deposed 1818.
1818	Chandra Kanta Singh—Burmese decline to leave—Chandra Kanta driven from Assam in 1820.
1824	War declared between British and Burmese Governments.
1825	Rangpur taken.
1826	Treaty of Yandaboo by which Assam was ceded to the East India Company.

CHAPTER IV. POPULATION.

Area and Density—Towns and Villages—Enormous growth of population—Distribution by subdivisions—Migration—Sex and Marriage—Infirmities—Language—Castes and Tribes—Religions—Mahapurushiyas—Moamarias—Sattras and Gosains—Occupations—Amusements and Festivals—The Bihus—Marriage Customs.

The district covers an area of 4,529* square miles Area and density. within the Inner Line, and, viewed as a whole, is very sparsely peopled, as there were in 1901, only 82 persons to the square mile. There are, however, wide variations from this mean. In the Dibrugarh tahsil†, which covered an area of 265 square miles, there were 314 people to the square mile, and in the Polonga and Chabua mauzas which adjoin it on the east, the density was as much as 377. East of Dibrugarh, along the Sadiya road as far as Saikhoa, a great portion of the land has been planted out with tea or other crops, but in the south, there are wide stretches of forest and waste. The Khowang and Jaipur mauzas, which march with the Sibsagar district, had 84 persons to the square mile, but then come Tippling with 27 and Makum with 38, while east of Makum is the huge Buri Dihing

* Revised figures of area have been received from the Survey Department. They differ from those furnished at the time of the census of 1901.

† The Dibrugarh tahsil was resolved in 1904 into the following mauzas:—Dibrugarh, Lahol, Mankatta, and Konikar, Jamira and Larua.

mauza in which there is hardly any population. North of the Brahmaputra, population is very sparse, and it is only near the subdivisional headquarters station, and the Nakari mauza immediately to the north, that it exceeded 100 to the square mile. In the Dhemaji and Sisi mauzas, west of Dibrugarh, which covered an area of 340 square miles, the average density was only 31. Table III shows the area of each mauza, the density in 1901, and the growth of population in the last intercensal period.

**Towns and
villages.**

Lakhimpur contains one town, Dibrugarh, and 1,123 villages. These villages are not, however, well defined units, clusters of huts which stand out clearly in the centre of fields tilled by their inhabitants. Rice, the staple crop, is grown in wide plains, dotted over with clumps of bamboos and fruit trees in which are buried the houses of the cultivators. It is groves and not villages that the traveller sees, when riding through the more densely populated portions of the district, and not a house can usually be discerned till he has penetrated this jungle of plantains, betelnut trees, and bamboos. There is generally no dearth of building sites, there are no communal lands, and there is nothing to keep the population together. It is difficult to tell where one village ends and another begins, or to which of the larger clumps of trees should be assigned the smaller clumps which are freely dotted about amongst the rice fields. The result is that a village, as defined for census purposes, is a very arbitrary unit, and the statistics showing their size are of little practical importance.

Taking them, however, for what they are worth, it appears that nine tenths of the villages are small hamlets with less than 500 inhabitants.

The first census of Lakhimpur is said to have been taken in 1847-48, and disclosed a population of 81,917. The methods employed can hardly have been exhaustive, but the accuracy of the enumeration was to some extent confirmed by the census of 1852-53, which gave a total of 85,296 persons.* For twenty years no further attempt was made to count the people, but in 1872, Lakhimpur was included in the general census taken in that year. The enumeration was far from being a synchronous one, the operations extended from November 1871 to the following February, and it is probable that part of the large increase that occurred in the next nine years was due to under estimation in 1872.

Growth of
population
since 1847.

The following table shows the population recorded at the last four enumerations, and the rate of increase in each intercensal period.

	1872.	1881.	1891.	1901.
Population ...	121,267	179,893	254,053	371,396
Percentage of increase ...	...	+ 48	+ 41	+ 46

In marked contrast with most of the other districts of Assam, Lakhimpur is an instance of extraordinary and continuous development. Within 29 years the population more than trebled itself. This enormous increase was mainly due to the importation of large numbers of foreigners, but there was also a satisfactory development amongst the indigenous population. Natu-

* Report on the Province of Assam by A. J. Moffatt Mills, Lakhimpur, Appendix A.—Calcutta, 1854.

ral growth is perhaps best measured by the increase in the number of those born and censused in the district, for in the absence of much emigration, and there is comparatively little emigration from Lakhimpur, this standard affords a fair test of the proportion of births and deaths, and of the general fecundity of the area under consideration. Where, however, the proportion of emigrants is large, a considerable number of the babies that are born are the children of mothers who have moved from other places into the district. The increase in those born and censused in Lakhimpur is thus appreciably larger than the increase amongst the indigenous inhabitants. It is difficult to measure this special development with scientific accuracy, as the indigenous inhabitant is a somewhat elusive entity, but the best results are obtained from an examination of the language tables. The following statement shows the percentage of increase that took place during the two last intercensal periods (*a*) amongst those born and censused in the district, and (*b*) amongst the speakers of indigenous languages.*

Percentage of increase amongst those born and censused in district.			Ditto amongst those using indigenous languages.
1881-1891	...	+ 22	+ 9
1891-1901	...	+ 24	+ 16

Regarded from every point of view the growth of population in Lakhimpur is eminently satisfactory. The importation of great quantities of coolies has rendered

* Indigenous languages have been taken to be Assamese, Garo, Bodo, Lalung and Chutiya. Miri has been excluded as there was a considerable influx of Miris from the hills between 1881 and 1901.

it possible to develop the very considerable natural resources of the district. Many of these immigrants have settled down, and have carried out the biblical injunction to replenish the land; but in addition to the growth amongst these settlers, there has been a substantial increase in the indigenous population. This increase is the more acceptable, in that, in the four lower districts of the Assam Valley, there was little or no natural growth amongst the natives of the country between 1872 and 1901.

More than three-fourths of the total population live in the Dibrugarh or sadr subdivision, and the development in this portion of the district has been phenomenally rapid. It contains many extremely prosperous tea gardens, Dibrugarh itself is a thriving little town, and the oil wells, railway, and coal mines afford occupation to a considerable number of labourers and artisans. Within the short space of twenty years the population rose from 126,000 to 287,000, and it is hardly necessary to add that the greater part of this enormous increase was due to immigration. The extent to which this portion of the district has been colonized from other parts of India is illustrated by the fact that in 1901, no less than 47 per cent. of the inhabitants had been born outside the Province; while many of the persons returned as "born in Lakhimpur," must obviously have been of foreign parentage. Although, in places, the population is fairly dense, there are still wide tracts of land available for settlement, and in the subdivision as a whole, there were, in 1901, only 94 persons to the square mile.

Distribution
by sub-
divisions.

North Lakhimpur is not so progressive as the country that lies south of the river. It is generally supposed to be rather unhealthy, its soil is not particularly suitable for tea, communications are defective, and, except that there is an abundance of waste land, the conditions are not such as would normally conduce to a rapid rate of progress. The great advance made during the past 20 years is the more satisfactory, and it must be largely due to natural growth, as in 1901, only 21 per cent. of the people censused in the subdivision had been born outside the Province. The density in that year was only 72 to the square mile, so that there is no fear of the increase of the people being checked by the straitness of their boundaries. The following statement shows the population of each subdivision in 1901, and the percentage of increase at each of the two last enumerations.

		Percentage of increase.	
		1891-1901.	1881-1891.
Dibrugarh	286,572	+50'3	+51'1
North Lakhimpur	84 824	+33'7	+18'0

Migration. 152,856 persons, or 41 per cent. of the population of the district in 1901, had been born in Provinces or States other than Assam. The immense majority of these persons were coolies, and about 72 per cent. of the total came from the neighbouring Province of Bengal. Comparatively few of these people were, however, actually Bengalis, and two-thirds of the immigrants from Bengal came from the division of Chota Nagpur, which supplies Assam with the healthiest but most costly of her labourers. Coolies also came in consider-

able numbers from the Central Provinces, and the United Provinces of Agra and Oudh, and there were over 2,000 from Madras. There were more natives of Rajputana censused in Lakhimpur than in any other district of the Province, these shrewd Marwari merchants reaping a rich harvest from the numerous tea gardens, and from the exploitation of the wholesale trade of this flourishing district. Other immigrants include Punjabi artizans, of whom there were a few hundreds, Kabuli traders from Afghanistan, and Nepalese, of whom there were over 4,000. Many of the latter were serving in the military police battalion, others earn their living as graziers, while others again have settled down to cultivation, sugar-cane being a crop to which they have devoted considerable attention.

As is only natural, Lakhimpur gains largely by inter-district migration, and in 1901, it received 13,552 persons from other districts in the Province, and only gave 3,504 in exchange. Most of the immigrants came from Sibsagar and Kamrup, almost all the latter being persons who had come up to work on tea gardens. Two-thirds of the emigrants went to the neighbouring district of Sibsagar. Further details with regard to immigration will be found in Table V.

The deficiency of women has always been very marked in Lakhimpur. At the last three enumerations, the proportion has been lower here than in any other district of the Province, and in 1872, the Cachar Plains was the only area which had a lower record. Between 1881 and 1901, the gross ratio slowly declined from 867 to 862

Sex.

for every 1,000 males, but this extremely low rate is no doubt partly due to the disturbing effect of immigration. Of the 13,500 persons received from other districts of Assam, no less than 10,000 were males, and the male element is always predominant amongst immigrants from outside the Province. The effect of immigration can, however, be eliminated by calculating the proportion on those born and censused in the district. Even when this is done, there is still a great deficiency of women, the proportion to a 1,000 males at the last three enumerations being,—1881, 957, 1891, 939, and 1901, 951. But the last named figure, after all, was higher than that reported from Sibsagar. The causes which regulate the proportions between the sexes are obscure, but it seems to be the general rule that women in the plains of Assam should be in a minority. Districts like Kamrup and Nowgong, where public health has been particularly bad, and where women have displayed a greater resistant capacity to these unfavourable conditions than the so-called stronger sex, form an exception to this rule.

Marriage.

It is satisfactory to know that the deficiency of women is not due to the prevalence of early marriage. The following abstract shows the percentage of Hindu girls under ten, and between ten and fifteen, who have performed the marriage ceremony, and the proportion between fifteen and twenty, who, even according to western ideas, would be considered *aptae viro*, who are still unwed. For the purposes of comparison, the figures for Goalpara have been included, as unfortunately in that district, the idea has gradually gained ground that

social advancement can in some way be obtained by subjecting an immature child to the responsibilities of matrimony.

Married and Widowed.		Percentage of Hindu Girls.	
Age.		Age.	
0—10		10—15	
Lakhimpur	... 0·8		12·6
Goalpara	... 4·8		62·4
Percentage of Hindu Girls unmarried.			
Age.			
15—20			
Lakhimpur	... 44·7		
Goalpara	... 7·2		

For every child-wife or widow under ten in Lakhimpur, there are six in Goalpara, and between ten and fifteen the proportion in the two districts is as five to one. The proportion of women of child-bearing age to the total population is obviously a factor which has much to do with its development. In this respect, Lakhimpur has some advantage, as 165 per mille of the inhabitants are married women between 15 and 40, as compared with 157 per mille in the Province as a whole.

Lakhimpur is fairly free from three out of the four special infirmities selected for record at the census. The proportion of insane persons is very low, while the number of deaf mutes, though 50 per cent. higher than the ratio for the Indian Empire, does not exceed the average for the Province. The proportion of the blind is distinctly below the Provincial and Imperial averages. This comparative immunity from some of the more serious ills of the flesh is largely due to the strength of the immigrant population, as the deaf and

dumb, the blind, and the insane are obviously not likely to leave their homes to seek their fortunes in a foreign country. The proportion of lepers is below the provincial average, but is double that prevailing in the Indian Empire. The following abstract shows, out of 10,000 males, the number afflicted with these four infirmities in 1901. The figures for males only have been given, as concealment is more likely to occur in the case of women, and in their case the figures for leprosy are probably incorrect.

Number of afflicted out of 10,000 Males.

			Lakhimpur.	Assam.	India.

Lepers	...	...	10	13	5

Language. The extent to which Lakhimpur has been denationalized, and the way in which the indigenous inhabitants have been swamped by hordes of immigrants, can be judged from the fact that Assamese was only returned by 39 per cent. of the population in 1901, as their customary form of speech. Six per cent. spoke Miri, and one per cent. Bodo or plains Kachari, but no less than 53 per cent. returned languages foreign to the Province. Twenty-one per cent. professed to speak Bengali, but it is doubtful whether, to an Assamese, Bengali means anything more than a foreign tongue, and this term probably included many forms of speech which would have been by no means understood of the people of Nadia. Fourteen per cent. returned Hindi, 6 per cent. Munda, and 2 per cent. Santali. Assamese is described by

Mr. Grierson as the sister not the daughter of Bengali.* It comes from Bihar through northern Bengal and not from Bengal proper, the plural and the feminine gender are formed in a different way from that in use in Bengali, and there is a considerable difference in the conjugation of the verb, in the idiom, the syntax and even in the vocabulary. The pronunciation is also different, the Bengali sh. being converted into h by the Assamese, and ch into s. Miri is classified as a Thibeto-Burman language and is said to be closely akin to Dafla, which is spoken in the hills a little to the west. The foreign languages need hardly be described in a gazetteer of Lakhimpur.

It has already been shewn by the tests of language Caste and tribes. and birth place that Lakhimpur is ethnically ceasing to be a portion of Assam, and that the indigenous inhabitants are gradually sinking into a position of marked numerical inferiority. More than half the total population of the district belong to foreign castes, the ones most strongly represented being the Mundas, Santals, Bhuiyas, Bhumijs, and Oraons. The history of these people and their customs will be found in Mr. Risley's Tribes and Castes of Bengal. The castes of the United Provinces are described in the admirable work by Mr. Crooke, so that any reference to these foreigners would hardly be in place in the present work. Table V gives details by sex and subdivisions of all castes which had more than 5,000 representatives in the district in 1901, and, in the following pages, some account is

* Report on census of India 1901, vol. I, p. 324.

given of those of them which are peculiar to Assam. As is only to be expected from the history of the district, the Ahoms form a large proportion, nearly one third, of the indigenous inhabitants. The Chutiyas are fairly numerous, though the bulk of the caste are living in Sibsagar, and Miris, Kacharis, and Doms or Nadiyals are found in considerable numbers. Kalitas and Kewats on the other hand, the typical castes of lower Assam, are comparatively scarce, and Brahmans and Kayasthas are naturally not numerous. The European population is considerable, and, in 1901, consisted of 350 males and 119 females; a community considerably larger than that in any of the indigo districts in the Patna division, with the exception of Patna itself. Nearly all the Europeans were living in the sadr subdivision.

Ahoms.
Males 29,703
Females 29,347

The Ahoms are the descendents of the Shan tribe who entered Assam in the thirteenth century, and gradually extended their sway over the whole of the Brahmaputra Valley. They are divided into three sections, the Chamuas or gentry, the Kheluas or functional sections, and the Meluas or servants of the royal family. These sections are not endogamous, though there is a natural tendency for men to take wives from families in their own rank of life, and inter-marriage between certain families such as the Handikoi and the Pakimara is prohibited, for reasons which are not very clear. The Ahoms still possess a sturdier physique than the ordinary Assamese, and the Muhammadan chronicler of Mir Jumla's invasion describes them as "strong, quarrelsome, and bold." The complexion is fair, the cheek bones high,

and the face unusually broad. Practically all the Ahoms are now, in name at any rate, Hindus, but their new religion sits lightly on them, and the lower orders still bury their dead. As amongst the other humbler Assamese castes, cohabitation often takes place after a feast has been given to the villagers, and there is nothing in the nature of a religious ceremony. The more respectable form is the *chaklong*, which consists in the interchange of the *temi* and *katari*, the box in which betel nut is carried and the knife with which it is cut, the tying of the nuptial knot, and a feast to the friends and relations. A hole is then cut in the corner of the house through which the bride is removed.

A woman once married by the "*chaklong*" ceremony cannot be re-married by the same rite, though she can take a second husband by the simpler form of marriage which is known as *gur pithaguri*. Divorce is recognised, and the parties can marry again. Agriculture is the staple occupation of the caste. Their social position is a somewhat peculiar one. The fact that, prior to our occupation of the country, they were the ruling race, obtains for them a considerable measure of respect; but the recency of their conversion to Hinduism necessitates a very low place in the Brahmanical order, and Brahmans will not, as a rule, take water from their hands.

In the days of native rule, Lakhimpur was too remote and wild a tract to have many attractions for the priestly caste, and the majority of the Brahmans have migrated to the district in comparatively recent times. The

Brahmans
Males 3,794
Females 1,014

marked disproportion between the sexes clearly shows that many of this caste are foreigners.

Chutiyas
Males 9,318
Females 8,330

The Chutiyas, like the Koch and Ahoms, are one of the race castes of Assam. The caste is divided into four subdivisions, Hindu, Ahom, Deori, and Borahi. The latter, as their name implies, are still unconverted and eat pork, but the number of Borahi Chutiyas is very small. The Deori Chutiya are the old priestly caste, and are described as follows in the census report of 1901:—

“Their original home was on the banks of the Kundil river east of Sadiya, but when the Ahom power began to decline, they were harried by the hill tribes in the neighbourhood, and at the beginning of the century they migrated to North Lakhimpur, and from there moved to the Majuli, the Dikrang river, Sissi Mukh, and the Baligao mauza in Jorhat. The Mongolian type is much more strongly marked in them than in the ordinary Chutiya, and they might easily be mistaken for Miris. They keep pigs and fowls, but their most distinguishing characteristic is the enormous size of the houses in which they dwell. These houses are built on *changs*, and are enlarged from time to time to make room for the increasing size of the family. There are frequently as many as sixty persons living in one long barrack, and the Chutiyas themselves say, that there are sometimes double this number living under one roof. The Deori Chutiyas on the Majuli profess to be Hindus, but beef is the only article of food from which they abstain, and it is said that all that they could remember of the instructions of their Gosain was that were to pray to God, and keep their instructions secret; and it was possibly with the idea of avoiding any risk of indiscretion that they had so carefully forgotten all that they had been told. Their temples are copies in wood and thatch of the famous copper temple at Sadiya, which was at one time a centre of worship for all the hill tribes on the north-east frontier, but has long been in ruins. These models are small buildings about eight feet square raised on high bamboos, and not unlike pigeon houses in appearance, standing in enclosures, into which no one but the temple officials are allowed to enter. In the principal village on the Majuli, a copper roof is being placed on the model to render the resemblance more complete. Mr. Brown, who was at one time Assistant Commis-

sioner in North Lakhimpur, reports that the Deoris attach great importance to their own religion, but that a knowledge of its mysteries is apparently confined to the priests and the older men. There are four priests attached to each khel, the Bor and Saru Deori and the Bor and Saru Bharali. The two Deoris alone are entitled to enter the temple, and the Bharalis, as their name implies, are mainly concerned with the temporalities of the goddess. The chief gods are three—Gerasi Geri (Assamese "Buraburi") worshipped by the Debongi khel; Pishadema (Assamese "Boliya hemata," the elder son, worshipped by the Tengapaniya khel; and Pesbasi (the daughter), who is also known as Tameshari Mai (the mother of the copper temple), and Kechakhati (the eater of raw flesh). The latter name is given in memory of the annual human sacrifice which in former times used to be offered to the goddess, the victim being provided by the Ahom Raja. This abomination was discontinued during the reign of Gaurinath Singh, and according to the Deoris the down fall of the Ahoms was largely due to their neglect of this religious rite.

The following interesting account of the human sacrifices offered near Sadiya is extracted from a note left by Lieutenant Dalton in the library of the Now-gong office :—

The chief and oldest of the shrines was the Tamar Ghar, or copper temple, which still exists in ruins and was lately visited by Captain Vetch. It is described as a small stone building nearly square, built without cement, the stones joined by iron pins not clamped. The roof was of copper, but it has fallen in, and now lies there. The interior is eight feet square. The whole is enclosed within a brick wall 130 feet by 200. Near the grand entrance in the western wall is a small stone tripod. Here human sacrifices were yearly offered till a very recent date, but latterly the Ahom kings gave for the purpose malefactors who had been sentenced to capital punishment. Suitable victims of this description were not, however, always to be obtained, and then a particular khel or tribe of the king's subjects was bound to provide one, for which they had certain privileges and immunities accorded them, such as being exempted from the payment of ferry and market duties; and were thence called *Sarh*, or free. For it was necessary that, the victims to be immolated, should be of pure caste and perfect form; the slightest blemish or mutilation, even the boring of an ear, rendering them unfit to be offered to

The human
sacrifices
of the
Chutiyas.

the Gosaini or goddess. Brahmans and members of the royal family were exempted as a privilege ; Doms, Haris, Musalmans, and women were excluded as unfit. For some time preceding the sacrifice, the victim to be immolated was detained at the temple, where he fared sumptuously, till in sufficiently plump condition to suit the supposed taste of the Gosaini. On the day appointed he was led forth magnificently attired, and decorated with gold and silver ornaments, to be shown to the multitude that assembled on the occasion ; then withdrawn, and led by a private path trodden only by the officiating priests and their victim to the brink of a deep pit, where he was divested of his fineries and decapitated, so that the body fell into the pit. The head was added to a heap of ghastly skulls that were piled in view of the shrine. These sacrifices appear to have continued till the subversion of the Ahom Government by the Burmese, when the Deoris abandoned their ancient possessions in the vicinity of the copper temple, to the fearful rites of which they had for upwards of six centuries administered, with the slaughter by their own account of some six hundred human victims."

The Ahom Chutiyas have for some generations been converts to Hinduism, but in the social scale they rank below the Hindu Chutiya, and their presence in a house is said to debar a Brahman from drinking water there. The Ahoms and Hindu Chutiyas can smoke, but cannot eat together, and, in theory, cannot intermarry. A member of the Ahom section can, however, obtain a Hindu Chutiya girl, if he is willing to pay a slightly higher price for her, but the bride sinks to the status of her husband. Hindu Chutiyas are sometimes united by the *hompura* ceremony, while the *chaklong* rite, which is the Ahom form of marriage, is in vogue amongst the Ahom Chutiyas. The Chutiyas are, however, far from strict in their views on matrimonial matters, and one native gentleman reports that 50 per cent. of the so called married couples have performed no ceremony at all, and that a girl sometimes changes her

husband nine or ten times. The social position of the caste is low, and almost all of them are petty cultivators. They burn their dead and perform the *sradh* ceremony at the expiry of a month. Brahmans of inferior social standing act as their priests.

The Kacharis or Bara, (mispronounced Bodo) as they call themselves, belong to the great Bodo tribe, which is found, not only in the Brahmaputra Valley, but in the Garo Hills, and in Hill Tippera south of the Surma Valley. It is generally supposed that they are a section of the Indo-Chinese race, whose original habitat was somewhere between the upper waters of the Yangtse-kiang and the Hoang ho, and that they gradually spread in successive waves of immigration over the greater part of what is now the Province of Assam. A prayer, which is still in use amongst the Dimasa* in the North Cachar Hills, lends some support to this view. It refers to a huge peepul tree growing near the confluence of the Dilao (Brahmaputra) and the Sagi. There the Kacharis were born and increased greatly in numbers, and thence they travelled by land and water till they reached Nilachal, the hill near Gauhati, on which the temple of Kamakhya stands. From Gauhati they migrated to Halali, and finally settled in Dimapur. The inscriptions recorded on copper plates in the tenth and eleventh centuries A. D. refer to the conquest of Kamarupa by a foreign dynasty, which was subsequently replaced by a king of the line of Narak.†

Kacharis
Males 13,711
Female 11,152

* The Dimasa are the Kacharis of North Cachar whose capital was originally at Dimapur.

† Vide J. A. S. B. Vol. LXVII Part I No. I, 1898 page 99.

It is possible that these invaders were Kacharis, and it would be natural enough for them to retreat towards the Dhansiri valley, on their expulsion from Gauhati.

The Kachari kingdom was one of the strongest powers with which the Ahoms were confronted when they entered the valley of the Brahmaputra. Their capital was located at Dimapur on the Dhansiri river, and at one time they were in possession of the western part of Sibsagar, and the greater part of the Nowgong district. Dimapur was sacked by the Ahoms in 1536, and the Kachari king was compelled to move his capital to Maibang. Subsequently they migrated to the plains of Cachar, and the last representative of the royal line was assassinated there in 1830. It seems, however, doubtful whether the Kacharis who live on the north bank of the Brahmaputra were ever in any way connected with the king of Dimapur. The one tribe style themselves Bara, the other Dimasa, and though both use languages of Bodo origin, the difference between plains Kachari and Dimasa is greater than that between French and Spanish. The two tribes sprang, no doubt, from the same stock, but there is no evidence to show that they were ever united by the tie of a common nationality, or that the Kacharis of Darrang were more closely connected with the Kacharis of North Cachar, than are the Rabhas or Garos.

The following legend is prevalent amongst the Dimasa of North Cachar. It would account for the separation of the Bodo and Dimasa, but no traces of the story have been found amongst the Kacharis of Darrang. Long ago

the Dimasa fought against a powerful tribe and were beaten in a pitched battle. They were compelled to give ground, but after a time, further retreat was barred by a wide and deep river. In despair, the king resolved to fight again on the following day, but in the night a god appeared to him, and told him that the next morning the army could cross the river if they entered it at a spot where they saw a heron standing on the bank. No one, however, was to look back while the movement was in progress. The dream proved true. A heron was seen standing on the bank, and the king and a great portion of his people crossed in safety. A man then turned to see whether his son was following, when the waters suddenly rose and swept away those who were in the river bed, and prevented the others from crossing. The Dimasa were those who succeeded in reaching the further bank in safety.

In Central and Lower Assam the great bulk of the Kacharis have remained faithful to their tribal form of worship, and on conversion, are received into the ranks of the Koch. This is not the case in Lakhimpur, where nearly all the Kacharis are, in name at any rate, Hindus, and live like other humble Hindu castes. Most of them are settled in the centre of the district not far from Dibrugarh.

The following description of the Kalitas is reproduced from the Report on the Census of 1901.

Kalita.
Males 3,310
Females 2,102

"There is much uncertainty as to the origin of this caste. The popular explanation is, that Kalitas are Kshatriyas, who fleeing from the wrath of Parasu Ram, concealed their caste and their persons in the jungles of Assam, and were thus called

Kul-lupta. Other theories are that they are Kayasthas degraded for having taken to cultivation, an explanation which in itself seems somewhat improbable, and is not supported, as far as I am aware, by any evidence; or that they are the old priestly caste of the Bodo tribe. The latter theory can hardly be said to account for their origin, and though it is possible that Kalitas may have originally acted as priests, this fact throws little or no light on the problem of what the Kalitas are. The most plausible suggestion is, that they are the remains of an Aryan colony, who settled in Assam, at a time when the functional castes were still unknown in Bengal, and that the word "Kalita" was originally applied to all Aryans who were not Brahmans.

The Kalitas are divided into two main sub-divisions, Bar and Saru, and into a number of professional subcastes. In Upper Assam Bar Kalitas are said to decline to use the plough, though they occasionally work with the spade, but there is no such restriction in Kamrup, where the great bulk of the caste is found. Cultivation is, in fact, the traditional occupation of the caste, and they even consent to work as coolies on tea gardens. The usual procedure for a Kalita who has succeeded in rising above the necessity for manual labour, and is no longer compelled to follow the plough, is to call himself a Kaist or Kayastha. Two explanations are given of the origin of the Saru Kalita—one, that he is the offspring of persons who for three generations back have not been united by the "*hom*" ceremony, the other that he is the child of a Bar Kalita and a Kewat woman. Whether the Bar Kalita can inter-marry with, and eat *kachchi* with the Saru Kalita seems open to question, and the practice apparently varies in different districts; but there seems to be no doubt that the functional sub-divisions of the caste are debarred from the privilege of close intercourse with the Bar Kalita. These sub-divisions are the Mali, Sonari, Kamar, Kumhar, Napit, Nat, Suri, and Dhoba. The first two inter-marry with the Saru Kalita, and also with the Kamar Kalita. The last four groups are endogamous. All these functional groups are to some extent looked down upon, probably because followers of these professions, who were not true Kalitas, have occasionally succeeded in obtaining admission within their rank; but the goldsmiths, from their wealth, have secured a good position in society. Kalitas have a good Brahman for their priest, and their water is taken by every caste; a fact which no doubt explains the high value attached to Kalita slaves in the time of the Assam Rajas, when two Koches could be purchased for the price of a single Kalita, though the Koch is generally the hardier and stronger man of the two.

Early marriage is common in Goalpara, but not in Assam proper, except amongst the upper sections of the caste. They take, in fact, a liberal view of the relations between the sexes, and cohabitation is the essential part of marriage. Well-to-do Kalitas are invariably united by the *hompura* rite and employ a Brahman. The poorer people often content themselves with the *agchauldia* or *juron* ceremonies, which consist of a feast to the villagers and a public acknowledgment of the position of the bride. Some authorities hold that this, though a valid form of marriage for the lower Assamese castes, is not sufficient for the Kalita. They regard the *hompura* rite as the one essential ceremony of purification. But it can be performed after cohabitation has begun, and sometimes takes place after the death of the husband. An unmarried girl, who becomes pregnant, does not forfeit her position in the society, unless her lover is of lower caste

Many of the Kayasthas are foreigners, and most of them earn their living by clerical work of one sort or another. Kalitas, who have risen above the necessity of manual labour, frequently describe themselves as Kayasthas.

The Kewats are a respectable Hindu caste, from whose hands Brahmans will take water, and who according to Assamese ideas rank immediately after the Kalita. These remarks only hold good, however, of the Halwa or cultivating Kewats. The Jaliya or

Kayastha.
Males 1,046
Females 696

Kewats
Males 2,566
Females 2,495

fishing subdivision of the caste occupy a very humble position in the social scale, and are considered little better than Nadiyals. The two sections of the caste have nothing whatever in common, except the name Kewat or Kaibartta, but the number of Jaliya Kewats is comparatively small. The ordinary occupation of the caste is agriculture, but a few of them have succeeded in reaching that desirable position in which the pen takes the place of the ploughshare as a means of livelihood. A respectable Brahman acts as their priest.

Miris.
Males 12,280
Females 12,631

The Miris, or as they style themselves, Mishing, were originally settled in the hills to the north of Lakhimpur between the Dafla and the Abor territory. They are thought to be members of the Thibeto-Burman family, and the Chutiya Miris claim kinship with the Chutiya. According to their own account, they descended from the hills with the Chutiyas, when first they conquered Lakhimpur, and retired again with them into their mountain fastnesses, when they were finally defeated by the Ahoms in the sixteenth century. On the advent of the British, the Miris again began to settle in the plains, a process which has been in steady progress ever since. Their countenances are of a distinctly Mongolian type, but their appearance is by no means unpleasing. They are strongly built, with finely developed limbs, and their complexions often have a distinctly ruddy hue. They are cleaner in their persons than many of the Tibeto-Burman tribes, and the more civilized amongst them

fully appreciate the advantages of the bath. The Miris are divided into two main endogamous septs, the Barogams and the Dorgams, which are again subdivided into a large number of minor groups. The Chutiya Miris give the names of these groups as the Chutiya and Doityal who intermarry, the Samaguriya who are endogamous, and the Saiengia, Aiengia, Moengia, Dombugiyal and Lassongoniya who intermarry with one another. These names are said to be derived from the different duars through which the different clans descended from the hills, and it is doubtful whether they correspond to any distinctions of genuine importance. In the plains, the Miris always live near running water. Their dwellings are built on piles, and are sometimes as much as forty yards in length, and contain from twenty to thirty inmates. Pigs and fowls scratch about beneath the houses, which are usually built in two long rows, and differ from those of the Assamese in having no fruit trees or gardens round them. They support themselves by agriculture, and raise crops of summer rice, mustard, millet, pulse, and sweet potatoes. Though more than half the Miris of Lakhimpur describe themselves as Hindus, they have liberal notions with regard to diet, and eat pork and drink rice beer. Buffalo flesh is not eaten by the Chutiya Miris. Their marriages are somewhat costly affairs, and entail a considerable expenditure upon food, which is borne by the families of the contracting parties. Sexual intercourse before marriage is not regarded with much disfavour, but, if the bride is unable to swear to her

virginity, she has to content herself with a comparatively quiet wedding. Traces of polyandry are to be found in the fact that adultery with a member of the husband's family is considered less heinous than if the offence is committed outside the clan. The general rule for adultery in the plains is that the corespondent should pay twice the cost of the wedding ceremony, after which he is allowed to take his mistress openly to his own house. A similar practice is reported from the hills, but, if the gay Lothario is unable to make the necessary reparation, the guilty couple are tied face to face, pierced with a bamboo stake, and thrown into the river. The bodies of these unfortunate lovers are not unfrequently brought down by the Subansiri, when the river rises in the rains. The dead are usually buried, and the funeral ceremonies include a substantial feast. The Miri religion is of the ordinary animistic type. It's principal feature is the propitiation of malignant spirits likely to do harm. They believe in the immortality of the soul, but do not attempt to dogmatise on the subject, and are somewhat impressed by the fact that the dead never return to this world.

The Nadiyals
Males 9,751
Females 6,165

The Doms, or, as they prefer to call themselves, Nadiyals, are the boating and fishing caste of Assam. They are anxious to assume the name Jaliya Kaibartta, but the Kaibarttas are unquestionably a different caste, though their manners and customs do not differ materially from those of the Assamese Nadiyals, except in the following particular. The Kaibarttas decline to use the *ghokata* net, and in theory only sell

their fish on the river's bank, within a paddle's throw of the boat, whereas the Nadiyals regularly take their catch to market. The Nadiyals are probably decended from the aboriginal race of Doms, the ruins of whose forts are still to be seen in India, but migrated to Assam before the Dom caste had been assigned the degrading functions now performed by them in Bengal. They are cleanly in their persons, and particular in their observance of the dictates of the Hindu religion, and account for the objectionable expression "Dom," which undoubtedly they have borne for centuries, by saying, that they were the last of the Assamese to be converted from Buddhism. They are darker in complexion than most of the Assamese, but have a good physique, and by no means uncomely faces. Their women are most prolific, and the Dom villages are full of fat brown babies. They rank very low in the social scale, and, according to Assamese ideas, are superior only to the Brittil Baniya or Hari. The bulk of the caste still live by fishing, and education has made but little progress among them. Marriage does not take place till the girl is fully grown, and they are free from any puritanical notions with regard to the relations between the sexes. Their priests are said to be decended from a Brahman father and a Nadiyal mother, but for all practical purposes they are Nadiyals and intermarry with Nadiyal girls.

The Koches are one of the race castes of Assam. The Koch.
Originally they were an aboriginal tribe, apparently Males 4,329
of Mongolian origin, which, at the beginning of the Females 3,335

sixteenth century, rose to power under their great leader Viswa Singh. His son, Nar Narayan, extended his conquests as far as Upper Assam, Tippera, and Manipur; and by the middle of the sixteenth century, the Koch king had attained to a position of such power, that the aboriginal people were anxious to be enrolled as members of his tribe. The result is that at the present day the name is no longer that of a tribe but of a caste, to which, in Lower Assam, new converts to Hinduism are admitted. In Sibsagar and Lakhimpur, these converts still retain their tribal names, and the Koch is a respectable Sudra caste, which is not broken up into various subdivisions. This is not the case in Lower Assam, and the different groups are there allotted a different status, which is dependent on the time that has elapsed since conversion took place, and the extent to which aboriginal habits have been shaken off.

Religion.

Classified by religion, the population of Lakhimpur was distributed in the following proportions in 1901.—Hinduism 90 per cent., Animism 5 per cent. and Muhammadanism 3 per cent. The three principal sects of Hinduism recorded at the census of 1901, were Saktism, Sivaitism, and Vaishnavism.

**Hindus-
Saktists.**

Thirty-four per cent. of the Hindus who returned their sect in 1901, described themselves as followers of Sakti, or worshippers of the reproductive powers as manifested in the female. More than half of these Saktists were, however, censused on the tea plantations, and a considerable number of those living in the villages were probably ex-garden coolies. The great

majority of these persons were no doubt so styled, because they ate meat and drank liquor, though this in a garden coolie is not so much an indication of his adherence to the goddess Kali, as of the uncertainty of his title to the name of Hindu at all. Saktism is a foreign growth in Assam, and Vaishnavism is the national form of Hinduism.

Sivaitism is the counterpart of Saktism, and is concerned with the worship of the procreative energy as manifested in the male. In 1901, 9,079 persons in Lakhimpur professed this special form of Hinduism, a large proportion of whom were found in North Lakhimpur. It is, however, doubtful whether the distinction between the worshippers of Siva and Sakti was very clearly understood. Sivaitism.

A considerable number of Hindus did not attempt to specify their sect in 1901, but, of those who committed themselves to this extent, nearly 62 per cent. declared their adherence to Vaishnavism. The following description of the development of Vaishnavism in Assam is extracted from the Report on the Census of 1901. Vaishnavism

"Sanker Deb, the apostle of Vaishnavism in Assam, was born in 1449 A. D., and was the descendant of a Kayastha who, according to tradition, had been sent, with six of his caste fellows and seven Brahmans, to Assam by the king of Kanaijpur as a substitute for the Assamese prime minister, who had fled to his court for refuge. The licentious rites of Saktism had aroused his aversion while he was still a boy, and his desire to found a purer system of religion was increased by the teachings of Chaitanya in Bengal. Like most reformers, he met with vehement opposition from the supporters of the established order and he was compelled to leave his home in Nowgong and to fly to the inhospitable jungles of the Barpeta subdivision. Here in conjunction with

his disciple, Madhab Deb, he founded the Mahapurushiya sect, the main tenets of which are the prohibition of idolatry and sacrifice, disregard of caste, and the worship of God by hymns and prayers only. Sanker himself was, like a true follower of Chaitanya, a vegetarian, but the low-caste people who formed a larger proportion of his converts, found his injunctions a counsel of perfection. The Mahapurushiyas are accordingly allowed to eat the flesh of game, but not of domesticated animals, though, with a subtlety only too common in this country, they observe the letter of the law, prohibiting the spilling of blood, by beating their victims to death. The great centre of the Mahapurushiya's faith is the *sattr*a at Barpeta, where a larger number of persons persist in living, huddled together, in defiance of all the laws of sanitation, and resist with surprising pertinacity all efforts to improve their condition. They are a peculiarly bigoted people, and are strongly opposed to vaccination ; with the result that the mortality from small pox in the neighbourhood of the *sattr*a is exceptionally high. It was not long, however, before the Brahmans reasserted their influence ; and shortly after Sanker's death, two of his followers, who were members of this caste, established sects, called, after their founders, Damodariya and Hari Deb Panthiya, which are distinguished from the Mahapurushiyas, by the respect paid to the distinctions of caste, and a certain tolerance of idolatry. A fourth sect was founded by one Gopal Deb, but it originally seems to have differed in no way from the Mahapurushiya creed, and subsequently its followers adopted the teachings of Deb Damodar. There is in fact, practically no distinction between the Damodariyas, the Hari Deb Panthiyas, and the Gopal Deb Panthiyas, and the Vaishnavites of the Assam Valley can be divided into the Mahapurushia and Bamunia or "other Vaishnavas," as they have been called in the census tables. The former will accept a Sudra as a religious guide, worship no God but Krishna, and are uncompromising in their hostility to idols ; the latter will only recognise Brahmans as their gosains, permit the adoration of other deities, such as Siva and Kali, in addition to that of Krishna, and allow sacrifices to be offered in their honour."

The Bamunias are also more liberal in their diet, and will eat goats, pigeons, and ducks, a form of food that is not allowed to orthodox Vaishnavites in Bengal. Madhab Deb, like most religious reformers, was a strict disciplinarian. The story goes, that the breach between

him and Gopal Deb arose one stormy day, when, the party were returning to Barpeta by boat. Gopal Deb, anxious for the safety of his teacher, apostrophised the storm clouds passing overhead, and begged them to restrain their fury till Madhab had reached the shore in safety. This innocent remark was construed into an invocation of Varuna, the god of rain. Gopal Deb was denounced as an idolater, and was incontinently, by order of Madhab, flung out of the boat. Such treatment was enough to damp the enthusiasm of the most ardent disciple. Gopal Deb, wallowing in the water, gallantly shouted out defiance to his former leader, and warned him that in future he would be treated with uncompromising opposition.

The Moamaras are a section of the Vaishnavas who for many years have borne a distinct and separate name, though the doctrines to which they pin their faith do not, according to their own accounts, differ in any way from those originally taught by Sankar Deb. The founder of the first Moamaria *sattr*a was Aniruddha, a disciple of Gopal Deb. One of the names by which his followers are called, *Purana Bhokot*, is said to have been given to them in consequence of an incident which occurred when Aniruddha paid his first visit to his spiritual teacher. Gopal Deb seems to have been aware that twelve holy men were coming to enrol themselves as his disciples, and determined to test the extent to which they had renounced the comforts of this world. He accordingly gave orders to have a new path cleared to the *sattr*a, and left the old one under jungle. Aniruddha

The
Moamaras.

was the only one of the twelve who deliberately chose the old and harder path, and this trifling act of mortification is still commemorated even at the present day.

The first *sattrā* was established by Aniruddha in 1615 A. D., at the Balikuchi village in the Narayanpur mauza of North Lakhimpur; but as it was too close to the villages of Daffas and other low caste people, it was removed by the gosain to the Nahorati village on the north bank of the Luhit. From there it was again moved, first to Kutiaputi in Jorhat, then back to the Majuli, then back again to Jorhat to the Barbheti in the Maloa Pathar, and finally in 1816 A. D. to the banks of the Dinjan near Chabua in Lakhimpur. At the present day, the Moamarias or Matakas are cut off from communion with the other Vaishnavas of Assam. Men of all castes are members of this sect, but a matak Kalita, Brahman, or Ahom cannot intermarry or eat with other Kalitas, Brahmans, or Ahoms; and the Matak members of each caste form an endogamous section in it. Their rigorous exclusion from bed and board by their caste fellows dates from the time of the Moamaria insurrection, for which their gosain was considered to have been principally to blame. Raghu, one of the leaders of this rebellion, seems to have compelled many of the principal Vaishnavite mohunts to become disciples of the Matak gosain, and this was an insult which they were quite unable to forgive. The horrors of that civil war were such that it is only natural that the memory of it should survive, and the Moamarias are still regarded with disfavour by other Assamese Hindus.

The Matakas are said to be extremely loyal to their gosain, and declare that the name itself is derived from *ekmat*, a title given them in recognition of their prompt obedience. The following story is told in illustration of their independence. One of the Ahom Rajas had heard that the Matakas would never bow their heads, and determined to put their stubbornness to the test. A sharp sword was fastened across a road at the height at which it would meet the neck of a mounted man, and a Matak was then ordered to gallop along the road. The foolish man declined to bend his head to avoid the sword, and as a natural consequence it was lopped clean off from his shoulders.

Apart from the Moamarias most of the Vaishnavites in Lakhimpur are disciples of the gosains residing on the Majuli. A full account of these gosains and their surroundings will be found in the Gazetteer of the Sibsagar district. The influence of these priests is very great, and they are possessed of considerable pecuniary resources, as every disciple sends a yearly offering varying from a few annas to five or six rupees. Offerings are also made in kind, especially by villagers who live in the vicinity of the *sattras*, and consist of rice, paddy, home made cloths, molasses, plantains, and the other products of their farms and gardens. The *sattras* store houses are thus always full of all the material comforts valued by the Assamese. In every community which includes a considerable number of his disciples, the gosain has a *medhi* or agent, who sometimes occupies as high a position in the social economy of the

Gosains.

village as the *gaobura* or village elder appointed by the Government.

At certain seasons of the year, the gosains go on tour through the villages and are visited by their followers. These progresses are generally attended with considerable pomp and dignity. If the journey is made during the rainy season, the gosain and his followers travel in state barges, whose curved prows and slender lines distinguish them from the ordinary rough built country boat. Most of the *sattras* own one or more fine elephants, and these ponderous animals take a leading part in the procession that escorts the spiritual leader of the people. The gosain himself is carried in a litter, drums are beaten and cymbals clashed before him, and when he alights he is not permitted to touch the ground with his bare feet. It is not always that the influence of the priest is used for good. Bigotry and intolerance, and dislike to change or progress in any form, are often found in those who profess to be the ministers of God, but from reproaches of this kind the Vaishnava gosains of Upper Assam are entirely free. Dignified but courteous in their demeanour, they have ever been noted for their loyalty to Government, and their influence is altogether beneficial in encouraging purity of life, and obedience to the authorities.

Sattras.

There are only three *sattras* in Lakhimpur itself. The principal Moamaria *sattra* is situated near Chabua on the Dinjan stream, and is wanting in the dignity attaching to similar institutions in Sibsagar. The Namghor is not much larger than that found in any

ordinary prosperous village, there are no lines occupied by resident *bhokots*, and a traveller might easily pass by the place without realizing that he was in the neighbourhood of one of these religious houses. The gosain enjoys a grant of 2,502 bighas of land, held at half the ordinary rates of land revenue, and possesses some six or seven elephants. Worship is carried on by thirty or forty *bhokots* who live in the neighbourhood of the Namghor. The building itself consists of a huge hall, whose roof is supported on massive wooden pillars. At the further end is a *singhasun*, or species of carved lectern, on which the sacred book reposes, but except for this the whole of the floor space is bare. Curious paper masks, and figures which are used in theatrical performances, are suspended from the pillars, and in one corner are some colossal drums. The Doms or Nadiyals are not allowed to enter the main Namghor, and worship in a smaller building close by. Another Moamaria sattrā is situated at Gorpara in the Rohmoria mauza, and holds a grant of 427 bighas of land on favourable terms.

The Tiphuk sattrā is said to have been founded in the latter half of the eighteenth century, and was situated in the Ujannakhankbola mauza. There were no temple lands allotted to this institution, but the gosain, who is an Ahom, was allowed a remission of Rs. 10 on his land revenue, and remissions of Rs. 3 were allowed to 106 of his disciples. This concession has now, at the request of the gosain, been withdrawn, and in its place he has been given a thousand acres of land under thirty years

lease in the Buri Dihing mauza, to which it is proposed to move the *sattras*.

Most of the Assamese in the Tipling and Ujannakhan khola mauzas are disciples of the Tiphuk gosain, while the Moamarias are found in the Rangagora, Chabua, Polonga, Rohmorla, Bogdong, and Madarkhat mauzas. Elsewhere, the bulk of the Vaishnavites are disciples of the gosains of Auniati, Dakhinpat, and Garamur.

Temples

In addition to the *sattras*, there are a few small temples in the district, all of which are situated north of the Brahmaputra. The buildings are insignificant erections of bamboos, reeds, and thatch, and each of them is endowed with a few acres of land held revenue free or at half the ordinary rates. The following statement shows the names of these so called temples and the mauzas in which they are located.

<i>Mauza.</i>		<i>Temple.</i>	<i>Mauza</i>		<i>Temple.</i>
Lakhimpur	...	Nil Gosain.	Naobaicha	...	Lonpani Mura- bhoga.
Do.	...	Panchanan Gosain.	Gohaingaon	..	Harhi
Do.	..	Boithaathi Gosain.	Narayanpur	...	Phulpani.

The number of temples and *sattras* in Lakhimpur is small enough, but this is not unnatural in a frontier district, which was too remote from court, and too much exposed to raiders from the north and east, to offer many attractions to the priestly caste. The population too was sparse, and Brahmans doubtless shrank from settling amongst the rude and jungly inhabitants of Lakhimpur. Relics of the Chutiyas'

barbaric creed are to be found in the Sadiya mauza ; and in the villages of Kokramara, Lakhimpur, Kundilgao, and Bozalgaon there are silver images of the old gods and goddesses such as Tameswari, Buraburi, and Kesakhata, which are worshipped by the people.

The most sacred place in Lakhimpur is, however, the Brahmakund, a deep pool in which Parasu Ram is said to have cleansed his axe after the slaughter of the Kshatriyas, and which is an object of pilgrimage to devout Hindus from every part of India. From Sadiya, the would-be pilgrim can go by road to Chunpura, a distance of 16 miles. Here he must take to his boats, and the strength of the current can be judged from the fact that, while the journey up stream to Mishmi ghat takes two days or more, down stream it can be completed in $2\frac{1}{2}$ hours. From Mishmi ghat it is a march of about 14 hours to the Brahmakund, the route for the most part lying along the dried up beds of rivers, and in some places for several miles up running streams. At Chowkham's village near Mishmi ghat, there are the shops of several *kaiyabs*, but this is the only place where supplies can be obtained. The charge for a boat from Sadiya to Mishmi ghat and back is Rs. 2 per head ; and from Chowkham onwards, the cost of each coolie is Rs. 5, in addition to Rs. 2 commission to the Khamti chief by whom they are supplied. The pool itself is situated at the point where the Brahmaputra debouches from the hills upon the plain. The river at this point sweeps round in a mighty curve, and the Brahmakund is situated in a back water on the south bank. It is

The
Brahmakund

surrounded on every side with hills, and the scenery in the neighbourhood is wild and impressive.

**Muham-
madanism.**

The proportion of Muhammadans (3 per cent.) is lower than that found in any other plains district of the Province. This is due to the fact that Lakhimpur is situated at the extreme end of the valley, well beyond the Moslem zone of influence. Most of the Muhammadans in 1901, were found in the sadr subdivision, and over a quarter of the total number were residing in the town of Dibrugarh. The first Muhammadan colonists are said to have settled about 100 years ago at North Lakhimpur and Jaipur. On our occupation of the country, Muhammadan sepoy stations at Dibrugarh and Sadiya contracted alliances with the women of the country, and made their homes in these two cantonments. Other recruits came in the shape of boatmen and traders from Bengal, with a certain number of ex-garden coolies. In 1872, there were only 3,826 Muhammadans in the district, but by 1901, their numbers had risen to 11,925. There are six mosques in Dibrugarh alone, five of which are masonry buildings. In the interior, worship is generally conducted in a hut, which occasionally takes curious forms. At Margherita, for instance, the mosque is a curious looking little building with a corrugated iron roof, and walls of well-tarred planks, which looks like anything rather than a place of worship.

Animism.

Most men find considerable difficulty in giving a clear and intelligible account of the faith that is in them, and the unsophisticated hillman is no exception to the general rule. Broadly speaking their religious

beliefs seem to fall under the following heads. Unlike the German metaphysician, they have no uncomfortable doubts with regard to their own existence, and the existence of the material world. To account for the production of these visible phenomena, they put forward various theories, which are hardly more improbable than the accounts of the creation given in most religious systems. The way in which the world came into existence is, after all, a matter of no very great importance, and the essential object of religion is to ensure a comfortable passage through life to its followers. No country or community is exempt from pain and trouble, and to the dwellers in the plains of India has been allotted a fairly liberal portion of the ills of life. When the cattle die, or small-pox or cholera visit the village, or other trouble comes, it is only natural to suppose that somebody or something is the cause of these misfortunes. The simple tribesmen then endeavour to ascertain the particular spirit from whose displeasure they are suffering, and to appease him in whatever way they can. A description of the various forms of tribal belief and of different methods of divination will be found in the Report on the Census of Assam in 1901 pages 46-49.

The number of animists in Lakhimpur is smaller than in any other district in the Assam Valley. In 1901, they formed less than 5 per cent. of the total population; whereas in the four western districts, the proportion ranged from 21 to 31 per cent. More than two thirds of these animistic people were censused in the

North Lakhimpur subdivision, where they formed about 16 per cent. of the total population.

Buddhists
4,572.

The Buddhists of Lakhimpur are not, as in most of the other districts of Assam, merely Bhutias, Nepalese, and other temporary immigrants. Most of them are Khamtis, Singphos, or Phakials; people, who have emigrated from Bor Khamti, the Hukong Valley, and the Shan States, and have settled in Assam. In the Phakial village on the Dihing river near Margherita, there is a regular Buddhist monastery. The building, like the other houses in the village, is raised upon stout posts, well out of reach of flood, and consists of one large room with several smaller chambers leading out of it, while from the centre of the roof rises a curious pagoda like erection. At one side of the main hall is a raised dais, adorned with curious pictures representing the tortures of the damned. To the mild Buddhist artist, to whom all life is sacred, this subject proves as fascinating as to the medieval priest. The unfortunate sinners are represented as being chased and torn by dogs, and speared by the evil spirits who accompany them, as being slowly crushed between rocks till blood oozes from their mouths and noses, and as being hurled into lakes of fire. Others are to be seen struggling in the thorny cane brake, or with cords around their necks being strangled and otherwise mutilated by evil looking demons. At the back of the dais there is an altar on which stand some twenty gilded images of Buddha, the largest being as much as two or three feet high. But the most curious thing about this place, right on

the frontier of a frontier district, is the strange mixture of east and west. Before the altar stands a camp table, save the mark, on which are placed quaint specimens of Burmese lacquer ware, intermixed with flower vases of a shape and pattern which sometimes disfigure a third class seaside lodging house in Eng and. On the floor around the Buddhas are to be seen almirahs with glass doors, looking glasses that are usually reserved for the bed-rooms of dak-bungalows, cheap American clocks, and other of the more hideous products of western civilization. The monks themselves have come from Burma, and, as in Burma, teach the village boys to read and write. The complicated Burmese character is laboriously inscribed on wooden boards smeared with charcoal, with pens that, like the teachers, have come from the neighbourhood of Moulmein. The Phakials themselves live in houses on piles, which are thatched with tokow leaves, (*livistonia jenkinsonia*) in place of grass. In the front verandah stands the loom on which the women weave cloths of a curiously complicated tartan. A part of the inner room is divided into tiny cubicles, and the Phakial sense of modesty is evidently more developed than is usual in Assam. More than half of the Buddhists enumerated in the district were Singphos and Khamtis, and a considerable number of the Nepalese professed themselves followers of this religion.

The Jains are the enterprising Marwari merchants, who have succeeded in obtaining so large a share of the district trade. The Brahmos belong to the advanced

and educated classes, the number of the Sikhs is too small to call for comment.

Christians.

The number of Christians is higher in Lakhimpur than in any other of the plains districts except Goalpara, and, as the figures in the margin show, the number of native Christians has been steadily increasing. Nearly half of these described themselves as "Kistan" and did not commit themselves to a preference for any special sect. Those who were brave enough to grapple with the intricacies of theology returned themselves either as Baptists or as members of the Anglican Communion.

Occupation.

As in the west of the Province, agriculture is the staple occupation of the people, but the proportion supported by it (87 per cent) is lower than that in most of the important tea districts. This is due to the existence of valuable coal mines at Tikak and Ledo, in which a large number of coolies are employed, to the oil wells at Digboi, and to the railway which carries these products to the Brahmaputra. The saw mill industry is also of some importance, and the enormous foreign population, who do not, like the natives of the country, provide for most of their own simple wants, supports a larger proportion of traders than is found in any other district in the Province. Nearly two-fifths of the persons supported by agriculture were garden coolies or their dependants. The immense majority of the remainder were petty cultivators holding direct from Government, as in this sparsely populated district the number of persons, who are willing either to occupy the land of another as a tenant, or to cultivate it as a servant, is naturally

small. The boating and fishing castes are not very strongly represented, and a large number of them have either abandoned their traditional occupation for agriculture, or have preferred to return it as a more respectable avocation on the census schedules. In 1901 the occupations of the people were classified under five hundred and twenty different heads, and details for the great majority of these heads will be found in Table XV, Part II of Part II of the Census Report. These figures do not, however, lend themselves readily to review. The proportion of workers to the total population (67 per cent.) is unusually high. This is due to the fact that the wives and daughters of the ordinary cultivator work in the fields, and to the large number of garden coolies, whose children begin to work at a very early age.

Feasts, singing parties, and *bhaonas* or simple theatrical performances are the principal amusements of the villagers. The *bhaonas* are often held in temporary sheds constructed by the road side, and on a winter's morning the traveller who is early abroad frequently comes upon parties of revellers still lingering over the pleasures of the previous night. The *dol jatra*, or festival in honour of Krishna in February or March, when the image of the god is swung to and fro, and the people pelt one another with red powder in memory of his amorous exploits with the milk maids of Brindaban, is not in much favour with the Assamese, but is an occasion of great merry-making for coolies and other foreigners. The *jammastami* in honour of Krishna's

Amusements
and
festivals.

birth in August or September, and the *Sivaratri* in memory of Siva in March, are kept as fasts rather than feasts, and the Durga Puja, like the *fagua* or *dol jatra*, is not a festival in which the Assamese Vaishnavites take much interest. The Kali Puja or *dewali*, which follows the Durga and Lakshmi Pujas, is a great occasion with the Marwari merchants.

The Bihus.

The special festivals of the Assamese are the three *bihus*, and the *sradh* ceremonies of Sankar Deb and Madhab Deb, the founders of the Mahapurushia sect. The Kartik *bihu* is celebrated on the last day of Aswin (October 14th.), and is not an occasion of very much importance. Hymns are sung in honour of God, and, in place of their usual meal of hot rice and curry, the people take cold food such as curds, molasses, plantains and cold rice. The Magh *bihu* is the harvest home, and begins on the last day of Pous (January 14th.). For weeks beforehand tall heaps of rice straw piled round a central pole, are a prominent feature in the rural landscape. At the dawn of day the villagers bathe and warm their chilled bodies at these bonfires, a very necessary precaution, as at this season of the year the mornings are always cold and generally foggy. The Magh *bihu* is to some extent a childrens' festival, and most of the jollification is confined to the smaller boys, who sing and dance and feast in small grass huts that have been constructed for the purpose. The Baisakh *bihu* which begins on the last day of Choet (April 14th.) is in honour of the new year. The cattle are smeared with oil mixed with matikalai, turmeric, and rice, and

are then taken to the nearest stream and bathed. The villagers go from house to house visiting their friends and relations, and offer them presents of cloths and other things. Buffalo fights are organised in the rice fields, but these contests are rather tame affairs and the animals very seldom injure one another. A game is also played with eggs, in which one is banged against the other, and the egg which cracks becomes the property of the owner of the cracker. This *bihu* is an occasion of some license, as boys and girls dance together in the fields and sing suggestive songs, and lapses from chastity between members of the same caste are considered almost venial. This is the season of the year when run-away matches are most common, and during the next few weeks the outraged but avaricious parent complaining of the abduction of his daughter, is by no means an uncommon sight in the local courts. The *sradh* ceremony of Sankar Deb is celebrated in August-September and that of Madhav three days before the *janmastami*. All work is laid aside on these two days and the people devote their time to feasting and the singing of hymns.

North of the Brahmaputra the villagers periodically assemble and offer prayers to God, imploring him to protect them from cholera, cattle plague, and similar misfortunes. In the Gohaingao mauza a large camp meeting of this sort takes place every year in the Gohaingao Raidengia Pathar. In the Kadam and Pathalipam mauzas such gatherings are held every second year or so.

**Marriage
customs.**

The forms of marriage in vogue amongst the Assamese are the *hompura*,* or full Hindu rite, when the sacred fire is lighted and a priest is engaged to perform the ceremony, the *khuru moni pindha*, in which a feast is given to the friends and relations, and ornaments are given to the girl, and the system, under which the bridegroom, who is called a *caponiya*, enters the house of his prospective father-in-law, and works for his wife as Jacob worked for Rachel. Brahmans, Kayasthas, and well-to-do Kalitas invariably perform the *hompura* ceremony. The cost of this ceremony varies according to the circumstances of the contracting parties. In the Rangagora mauza it is said that the dignity of a 'hom' can be obtained for the modest sum of Rs. 40 : but this seems to be a remarkably low estimate, and this form of marriage seldom costs less than Rs. 100, and sometimes as much as four or five times that sum. This expenditure is incurred on the purchase of ornaments and clothing, on the payment of priests, musicians, and paliki bearers, and on a feast to the relations and friends, the principal ingredients of which are rice, molasses, curds, and betel nut. In Lower Assam even Brahmans generally take money for their daughters, but this practice is indignantly repudiated in Lakhimpur. Even amongst the lower castes the custom of taking a bride price seems to be falling into disfavour, and when a girl has been regularly courted it is said that the father often foregoes his claim for a cash payment. The process of courting consists, however, not in the presenting to the girl of costly trinkets and other

* A description of this ceremony will be found in the Census Report for 1901. P. 63.

tokens of affection, but in conveying substantial loads of rice, curds, plantains, betel nuts, tobacco, and even opium to her father on the occasion of each *bihu*. If the young couple elope without these necessary preliminaries, the father demands, and generally obtains, fair compensation in hard cash. These elopements are not uncommon and are due to several causes. Sometimes the price asked for the girl is unreasonably high, or at any rate beyond the resources of her lover. The lady will then consent to an abduction ; as when once her lover has obtained possession of her person, her parents are more disposed to be amenable to reason. Sometimes she takes a dislike to her affianced lover, and, in spite of his protracted wooing of her father, takes the law into her own hands and goes off with the man that she herself prefers. Sometimes the father is a party to the fraud, and after taking presents from one man hands over the girl by private treaty to another. Complaints of abduction are not uncommon in the criminal courts, but the great majority are of a civil nature, and are generally settled by the payment of a small sum of money.

Most of the local authorities report that the *caponiya* is not allowed to have intercourse with the girl before he is publicly married to her, but, though such practices may not receive the formal sanction of the community, it is doubtful whether in private the girl would deny her favours to her affianced lover. The Ahoms generally marry by the *chaklong* rite, which has already been described. The Phakials near Margherita are reported to pay heavily for their brides, but in the neighbouring

mauza of Buri Dihing the cost of a wedding is said to be only forty or fifty rupees. The ceremony there consists of the distribution of alms in the presence of the Buddhist priest and the village elders, and a feast to the relations and friends. A feast is the essential part of the marriage ceremony amongst the animistic tribes, and the Miris further require that a girl of the bridegroom's family should be promised to some relation of the bride's. The girl in question may at the time be a child, but if, when she grows up, she is not duly handed over according to the terms of the agreement, the family of the original bride will take her from her husband, though by this time she may have borne him several children. In North Lakhimpur the Nadiyals marry by what is known as the *jhopa goriya* rite. The guests sit assembled in the courtyard of the house round six or seven baskets containing dried rice and other things. The bride and groom are loosely tied together with a scarf, and are led round the baskets by the bride's mother. The bride takes the lids off the baskets, the bridegroom puts them on again, and the elder girls in the meanwhile playfully strike them with branches of the castor oil plant. This form of ceremony has the advantage of being cheap, and only costs from twenty to twenty-five rupees, whereas a man who wishes to make some thing of a splash can spend ten times as much on the *hompura* rite.

CHAPTER V.

AGRICULTURE AND FORESTS.

Crops grown—Rice—Mustard—Pulse—Fibres—Agricultural implements—Sugarcane—Causes affecting productiveness of land—Garden crops—Outturn and value of staple crops—Floods—Live stock—Development of tea industry—Labour supply—Site of gardens—System of cultivation and manufacture—Outturn and prices—Forests—System of management—Timber trees.

The staple food crop of the district is rice, which in **Crops grown** 1902-03 covered 56 per cent., of the total cropped area. Other important crops are tea, 27 per cent., and orchard and garden crops 7 per cent., but a large part of the area shown under this head is occupied by the homestead, and it is doubtful whether as much as one half is actually under cultivation. Mustard occupied 3 per cent. of the total cropped area, miscellaneous food grains, nearly all of which are different forms of pulse, 2 per cent., and sugarcane 2 per cent. Wheat, barley, and gram, the food grains of Upper India, are grown in small patches by immigrants from those parts, but the total area under these three crops in 1902-03 was only 34 acres. The area under different crops will be found in Table VII. The general system of cultivation and the manner in which the staple crops are raised is described in the following paragraphs.

Rice. Sal.

Rice falls under three main heads, *sali*, *ahu*, and *baò*; the proportion of the total rice area normally occupied by each of these three classes, being *sali* 84 per cent. *ahu* 14 per cent. and *baò* 2 per cent. *Sali* dhan or transplanted winter rice, is first sown in little beds or nurseries (*kothiatoli*) near the homestead. The land is broken up in April or May, is ploughed five or six times, and is generally manured with cowdung and sweepings. The size of the nursery varies with the area to be planted out, but generally stands to the rice fields in the proportion of about 1 to 16. The seed, which has been selected from the largest ears of the previous year's crop, is steeped in water for two or three days, spread out to allow it to germinate, and sown broadcast over the bed in May and June. It comes up a rich emerald green, and, at the beginning of summer, these patches of the brightest green herbage are a striking feature in the rural landscape. In the meanwhile, the fields are being got ready for the reception of the seedlings. The industrious husbandman starts ploughing as soon as the soil is softened by the spring rain. The process is repeated from four to eight times, till the land has been reduced to a rich puddle of mud, but the bulk of the ploughing is not done till May or June. After the third ploughing the field is harrowed, the little embankments, a few inches high, intended to retain the water are repaired, and if the fields adjoin the road or the village site they are fenced in with split bamboo. When the seedlings are about seven or eight weeks old, they are taken from the nursery bed and carried in large bundles to the field. Here they

are planted out in handfuls (*gach*), each of which contains four or five plants. The distance at which these are planted from one another depends upon the fertility of the soil, but the handfuls are generally placed about 18 inches apart. It is not unfrequently the practice to steep the young plants in water before they are planted out, and if they seem too luxuriant, the tops are cut off at the time when they are removed from the nursery. Transplanting goes on from the beginning of July to the middle of September, and is generally carried out by women. The work is of a most arduous description, and involves stooping for hours in a field of liquid mud, under the rays of a burning tropical sun. Before the end of the rains the crop is fully grown, though the ears are still empty, but about the beginning of October they begin to fill, and the field to turn to a rich yellow. From the middle of November to the middle of January harvesting is going on. The women grasp a handful of the ears and cut them off about eight inches below the head. These handfuls (*muthi*) are tied up with a piece of straw and left in the field for a few days to dry. When the grain is ready to be transported to the granary, the *muthis* are made into larger sheaves. Six *muthis* form a *thor* or *jhap*, and five or six *thors* a *dangari*. A *dangari* is then affixed to either end of a sharp pointed bamboo called *biriya*, if a split springy bamboo, or *kanmari* if of a larger stouter kind, and the load, which is called a *bhar* and carried across the shoulder, is taken to the homestead by the men.

The different kinds of *sali* dhan fall under two main

divisions, *lahi* and *bar*. *Lahi* ripens earlier than *bar*, and, though the grain is of a finer quality, the yield is appreciably smaller. It is planted on the higher fields which dry up first at the conclusion of the rains, and which are thus not suitable for *bar*. Altogether there are said to be not less than 70 different varieties of *sali* dhan in the district.

Bao dhan. *Bao* dhan is sown broadcast about the end of March, the field having been previously prepared by four or five ploughings. It is grown in flooded tracts, and the embankments made between the fields are smaller than in the case of *sali*, and are sometimes dispensed with altogether. It ripens about the beginning of January, and is harvested in the same way as *sali*. *Bao* dhan is hardly ever grown except in the low land in the Dibrugarh tahsil, and the country lying between the left bank of the Subansiri and the Brahmaputra. The crop is a precarious one as it is liable to be destroyed by flood, and the population is not yet sufficiently dense to render it necessary to occupy the less favourable tracts.

Ahu dhan. *Ahu* or summer rice is grown either on high land, or on low land near the Brahmaputra, the Luhit, and the Subansiri. For low land cultivation the usual procedure is as follows :—

In May the jungle is pressed down and burnt, and the land left till towards the end of the rains. The jungle that has sprung up in the interval is cleared in the same way, the process being known as *gojola kata*,

and ploughing begins in January. The field is ploughed three times and harrowed, and the clods are broken up by a mallet. Another ploughing and harrowing follow, the seed is sown, and the land again ploughed and harrowed, to ensure that the grain becomes thoroughly mixed with the soil. When the plants are about six inches high and catch the wind *botah boloah*, they are harrowed again and weeded, and finally harvested about the end of August. The crop is, however, a precarious one, and is liable to be destroyed by a sudden rise of the river. The plants can live under water for as much as a week, but if, after this time, the floods do not retire, they are permanently destroyed. *Ahu* is often grown on the *chapolis* in conjunction with mustard, and no jungle cutting is of course required when the soil has been already cleared for the oil seed crop. The same field is seldom cropped for more than three years in succession. The weeds, which were unable to find a lodging under the dense growth of *ikra* (*saccharum arundinaceum*), *khagari* (*saccharum spontaneum*) and *nal* (*phragmites roxburghii*), with which the land in its natural state is covered, soon spring up when once the jungle has been removed. After the third year, it is less trouble to burn fresh jungle than to clean the old fields of weeds, and by a change of site the peasant gets the further advantage of the manure of ashes for his next year's crop.

High land *ahu* is grown on land which is too high for transplanted rice, and is fairly common in the Ujan Nakhankhola mauza and in the country near the foot.

of the Himalayas. In its natural state this land is covered with a scrubby forest, and, as the same field is not cropped for more than three years in succession, the *ahu* cultivation of Lakhimpur closely resembles the *jhum* cultivation of the hill tribes. It is a significant fact that this high land *ahu* is seldom combined with pulse and mustard, though there is no reason why one or other of these crops should not be taken from the field in the cold weather. After the land has remained fallow for five or six years, the villagers return to it again.

Mustard.

Mustard, as has already been said, is usually grown in conjunction with *ahu* on the riparian flats. The jungle is cut down in February and March, and, if the land cannot be prepared in time for summer rice, is allowed to rot upon the ground. What remains is burned in October, the stumps are dug out, and the land is then ploughed over four or five times. The seed is sown about the middle of November, and the plant is ready to be pulled from the field about the middle of February. It is generally left to dry for a few days, and is then tied in bundles and carried to the homestead, where it is threshed out by the cattle. Almost the whole of the crop is raised in the North Lakhimpur subdivision; Dhakuakhana, Gohaingao, Telahi, and Narayanpur being the mauzas in which most of it is grown.

Pulse.

Pulse is sometimes grown on the alluvial flats that fringe the Brahmaputra, in conjunction with summer rice

and mustard, but a crop is often taken from the land on which rice seedlings, early rice, and sugarcane have been grown, as it is generally and rightly thought to improve the quality of the soil. In the *chaporis*, if new land is taken up, the first proceeding is to cut and burn the reeds and grass. Only two ploughings are required, and those are of the very lightest character, and, if the ground is naturally clear of jungle, the seed is sometimes simply sown on the river flats as soon as the floods subside. Pulse is also scattered broadcast amongst the rice stubble, or between the *sali* plants, if the land is still soft; but this method is not generally in use. The seed is sown in September, and the crop is ripe about four months later. The plants are pulled up by the roots, left for a few days in the field to dry, and are then collected at the convenience of the cultivator. The seeds are threshed out by cattle, but as the grains do not separate readily from the pods, their efforts are supplemented by a man with a flail. Several different kinds of pulse are grown, but nine-tenths of the crop belong to the variety known as *mati-mah* (*phaseolus mungo radiatus*). Other kinds are *magu-mah* (*phaseolus mungo*), a species which has a smaller yield and requires more careful cultivation but commands a higher price and possesses a more delicate flavour. It is seldom grown except on the river *chaporis*. *Kala-mah* (*lathyrus sativus*) is grown, but not in any considerable quantities. It has a large yield but does not fetch a high price. The principal pulse producing tracts are the Dhemaji, Gohaingao, and

Telahi mauzas on the north bank, and the Dibrugarh tahsil.

Fibres. Jute is grown in small patches as a garden crop. The seeds are generally sown in April, and the plants are cut in August and September, stripped of their leaves, tied in bundles, and left to rot in pools of water for from seven to twelve days. When they are ready, a handful of stems is taken up, broken in the middle, and beaten to and fro in the water, till the inner part drops out and only the fibre remains. The bundles of fibre are then dried and are ready for use, but the area under jute is at present absolutely inconsiderable. Small patches of rhea (*boehmeria nivea*) are grown in the gardens of the fishing castes, where it is heavily manured. The skin is stripped off from the stem and the fibre separated from the outer covering. The thread obtained is exceptionally strong and durable, but the difficulty of decortication has hitherto prevented the growth of rhea on a commercial scale.

**Storage and
threshing of
grain.**

The grain is usually stored as it is brought from the field in an outhouse called *bhoral*. When it is required for use, the sheaves are untied and spread over the courtyard. Cattle are then driven round and round over the heap of grain and straw, till the ears have been finally separated from the stalk.* The grain is next passed through a sieve, and placed in a flat bamboo tray called *kula*. It is then jerked into the air and

*An experiment made by Mr. Darrah, Director of Land Record and Agriculture showed that nine bullocks took 2 hours and 8 minutes only to thresh out 7½ maunds of paddy.

allowed to fall back into the tray, or held aloft and allowed to fall slowly to the ground, till gradually the chaff is carried off. After threshing, the paddy is stored in huge drums, called *duli or mer*. They are made of split bamboo, and the outer surface is plastered over with clay and cowdung.

The agricultural implements in use are of a very simple character. The plough is usually made of the jack fruit tree or some other hard wood, and consists of three parts: the handle and body which are usually all in one piece, the pole which joins the plough at the junction of the handle and the body, and the yoke which is merely a piece of wood, fastened by rope at right angles to the pole, with pegs affixed to it, to keep it from sliding from the necks of the bullocks. The front portion of the body is sharpened to a point which is shod with iron, and in soft soil a piece of bamboo is sometimes substituted for the iron. This piece of iron is the only portion of the plough which the farmer has to purchase. The rest he makes for himself. The whole instrument is suited to the wretched class of animal required to draw it. It weighs as a rule about 20 lbs. and, when cattle are used, the yoke seldom stands as much as 36 inches from the ground. When buffaloes are employed, the whole plough is constructed on a larger scale. It is obvious that such an implement can only penetrate from three to four inches into the soil, but the wretched quality of the plough cattle prohibits the use of a more effective instrument.

The harrow (*moi*) is generally a bamboo ladder, about

Agricultural implements.
The plough.
Other implements.

eight feet in length, on which a man stands as it is drawn across the field. It is used to crush the clods turned up by the plough before mustard or summer rice is sown, and to reduce the fields required for wet rice to puddle. Its place is sometimes taken by a plain log of wood. It is prepared by the cultivator himself from the bamboos growing in his garden. Clods are broken by the mallet (*dheli mari*) which is also made at home. Hoes (*kodalis*) are used to trim the embankments (*alis*) which help to retain the water. The head is bought in the bazar, and costs from Re 1 to Re. 1-4, and is fitted with a shaft by the farmer himself. Sickles, (*kachi*) with which the rice is reaped, have also to be purchased and cost from two to four annas. In *ahu* cultivation, a large wooden rake (*bindha*), with teeth nearly one foot in length, is dragged over the crop by a bullock when the plants are about six inches high. The *nirani*, a kind of trowel with a long handle, is used for weeding *ahu* rice. The sugarcane mill is described in the paragraph dealing with the preparation of molasses. The ordinary implement used for husking grain is the *dheki*, a long beam with a pestle affixed at the end, which is supported by two posts at about two thirds of the length from the head. The shorter end is depressed by the foot, and the pestle is thus raised into the air; the weight is then removed, and the pestle falls into a small hole, in a piece of wood sunk level with the ground, in which the grain is placed. The *dheki* is the implement ordinarily employed by the Assamese to husk their rice or pulse, but the animistic tribes generally use a large wooden mortar

(*ural*) and a pestle (*muri*). All of these implements are made at home.

Sugarcane (*saccharum officinarum*) is propagated from the tops of the best canes, which are cut off at harvest time and kept in a shady place. One of these tops yields on the average about five canes, and as they contain but little juice, the cultivator does not sacrifice much of the gross product of his fields in the cause of reproduction. Four principal varieties of the plant are recognised. The *bagi* or white stands about seven feet high and has yellow canes of a soft juicy texture. The *teliya* is shorter, harder, and thinner, and the canes are of a deep red or even purple colour. The *Bangala* or *Bam*, a foreign variety, is larger and more juicy than the indigenous kinds, but yields a smaller proportion of sugar. The *megala* is a hard and thin variety of the *mugi*, and, where grown, is planted round the edge of the field. The land is hoed up till it is reduced to a fine tilth, and the tops planted in trenches between April and June. The patch is fenced with split bamboo, and there is usually a stout hedge of arhar dhal (*Cajanus Indicus*); but constant watching is required to scare away jackals and other animals, and an empty oil tin with a clapper is generally to be seen suspended over each field. While the crop is growing it is continually hoed and weeded, and about August the leaves should be tied up round each cluster of canes, which is a troublesome proceeding. The earth from the ridges is heaped about the roots to strengthen their hold upon the soil, and this process is continued, until the relative

Sugarcane.

positions of ridge and trench are reversed, and the canes stand upon ridges with the trenches in between.

Most of the sugarcane in Lakhimpur is grown in the Dibrugarh tahsil, and in the Sadiya, Rohmoria, and Madarkhat mauzas of the sadr subdivision; and in Gohaingao and Naokhari in North Lakhimpur. It is often planted out on virgin forest land, which needs no manure and gives a rich yield. The Nepalese, who are largely engaged on it's production, plant their tops at the time when they are reaping the ripe crop. Harvesting goes on from January to April, and during the winter nights and in the foggy mornings the drone of the sugarcane mill is heard coming across the fields, in nearly every part of the Assam Valley where the "works of men" are to be seen.

Preparation
of molasses.

The native form of mill is still used by the Assamese for the extraction of the juice; but the iron mill which is far more expeditious is coming into favour amongst the foreigners. The native mill consists of two wooden rollers, fixed side by side in a trough hollowed out of a heavy block of wood. The tops of the two rollers pass through a hollow beam, supported by uprights let through the lower block of wood into the ground, and are cut into the form of screws which fit into one another. To the larger of the two (*mota bhim* as distinguished from *maiki bhim*) is affixed a pole, which is driven round in a circle, and thus causes the rollers to revolve. The motive power is usually supplied by the villagers themselves, but buffaloes are occasionally used for the work. The mill requires

rather more knowledge of carpentry for its production than the other implements of agriculture, and can only be made by the more skilful of the villagers. The cane is placed between the rollers and crushed as it is slowly forced through. Each handful is passed through the mill three or four times, till nothing but foam appears. The juice trickles from the trough into an earthen vessel, and is then transferred to a small boat scooped out of a log. When twelve or fifteen gallons have been collected, boiling begins. The furnace is hollowed out of the ground, and has four circular openings to receive the cauldrons, which are made of the most durable kinds of potter's clay. Two of these vessels are placed about 9 feet from the furnace mouth, and only serve to heat the juice before it is transferred into the other vessels to be boiled. When the juice has been reduced to the proper condition, it is ladled into a wooden vessel (*gholani*) shaped like a small dug-out, and is stirred for half an hour. As the stirring continues, the liquid loses its dark brown colour, and assumes the consistency and hue of yellow mud. It is then stored in earthen pots and the process is complete.

The fertility of the rice fields mainly depends upon the following five causes: the water supply, the quality of the soil, and the liability to injury from flood, wild animals, or shade. The first named factor is probably of most importance. The soil of the district varies from pure sand near the Brammaputra to clay so stiff as to be utterly unfit for cultivation. The land best

Causes affecting productivity of land.

suited for the growth of rice is a clay loam *alattia*, the most fertile variety of which is called *bher bheria*, and is particularly deep and soft. The animals which do most injury to the crop are pigs, elephants, and monkeys. Elephants leave disastrous traces of their presence, but luckily do not remain long in any one locality, and are generally only found in parts of the Saikhoa, Jaipur, Buri Dihing, Makum, Sadiya, and Tengakhat mauzas. Serious damage is sometimes done by insects which are called *keonkata*, *tupalia*, *gandhi* (*leptorisa acuta*) and *charaha* (*hispa acuesceus*). The *gandhi* is a small bug, which injures the rice plant by feeding on the stems and sucking all the sap from the young grains. It is most prevalent in July and August, and is particularly in evidence during a spell of hot dry weather. High wind and rain drive it back into the jungle, and good results are obtained by lighting fires of vegetable refuse to windward. The best remedy of all is to collect the insect by smearing a winnowing fan with some glutinous substance and brushing it over the ears of grain, when many of the bugs will be found adhering to the fan. This remedy should be tried in the morning or late afternoon as the insects do not feed in the heat of the day. The *charaha* is a tiny beetle, which eats away the outer surface of the leaves and stalks and thus affects the outturn of the crops. It attacks the young plants in the nursery and can most easily be destroyed there by spraying.* Smoking the fields also produces good

* The best solution is 1 lb. Paris green, 1 lb. freshly slacked lime or flour and 150 gallons water. The solution should be kept constantly stirred and should be sprayed on with a fine sprayer.

results, but must be continued for some days or the beetles will return. Rain is wanted when *sali* rice is sown and is transplanted, but is not needed for the sowing of *ahu* and *bao*. During every stage of its growth, the plant is benefitted by moderate showers, but rain is absolutely essential at the time when the ears are first appearing. Hail storms in December sometimes lay the crop and add materially to the cost of reaping, but fortunately are very local in their action.

One of the most valuable of garden crops is the plantain (*musa sapientum*). As many as ten main varieties of this tree are recognized, but the most important are these known as *athia*, *monohar*, *cheni champa*, *malbhog*, *jahaji*, and *pura*. The first two groups are again subdivided into a considerable number of different species. The commonest form of *athia* is called *bhim*, a large tree which is found growing in the garden of nearly every house. The fruit is considered cool and wholesome, and is very generally used as food for infants. The *monohar* is a somewhat smaller tree; the pulp of the fruit is white and slightly acid in taste, and is largely used in combination with soft rice and milk at village feasts. The *malbhog* and *cheni champa* are small trees, whose fruit is much appreciated by Europeans. The *athia* plantain is generally grown near the homestead, where it can obtain a plentiful supply of manure; but the finer varieties are planted at a little distance to protect them from the earthworms, whose attacks they are hardly strong enough to resist. Sandy soil and heavy clay

Garden
crops.

The Plantain

check the growth of the plant, and anything in the shape of waterlogging is most injurious. The trees are planted in holes about a foot wide and eighteen inches deep, and are manured with cowdung, ashes, and sweepings. Young saplings take from 18 months to two years to flower, and the flowers take from three to six months to turn to fruit. The plantain tree plays many parts in addition to that of fruit purveyor. The flower is much esteemed as a vegetable, the leaves serve as plates, and the trunks are used for decorative purposes on occasions of ceremony, and as food for elephants. An alkaline solution, distilled from the sheaths and the corm, is often used as a flavouring with curry, a practice which is mentioned by the Muhammadan historians of Mir Jumla's invasion. These portions of the tree are sliced, dried, and reduced to ashes. The ashes are placed in an earthen pot, in which there are several holes lightly plugged with straw. Water is then poured over them, which dissolves the alkali and trickles through the holes into the receiver below. The resulting product, which is known as *kharpani*, is used, not only as a seasoning, but as a hair wash, and as a mordant with certain dyes.

Other
garden
crops.

The betel nut (*areca catechu*) is grown almost as universally as the plantain, and with the bamboo, forms the great trinity of trees in which the houses of the Assamese are usually embedded. The plantation is hoed up, and kept clear of weeds, and the trees are most liberally manured with cowdung. The pan vine (*piper betle*) is frequently trained up their stems,

and the leaf and nut, which are invariably eaten in conjunction, are thus grown side by side. Tobacco is a plant which is to be seen growing in the majority of gardens. The seedlings are raised in carefully manured beds in August and September. At the beginning of November they are transplanted into ground which has been reduced to a fine tilth, watered for a few days, and are protected from the sun by little sections of the plantain trunk. The bed is lightly hoed up two or three times, and not more than ten or twelve leaves are allowed to grow on each plant, the remainder being picked off as they appear. The leaves are first gathered in February and March, and there is a second but much inferior crop about two months later. If required for chewing, they are either dried under a shed, or else pressed into a hollow bamboo (*calunga*) and allowed to ferment. When the tobacco is destined for the pipe, though this is not the use to which it is generally put, the leaves are piled up in heaps till they ferment, cut up and mixed with molasses, and then are ready for the hookah. The commonest forms of vegetable grown are, spinach *pui* (*basella alba*) *lahi*, a species of *brassica*, different kinds of arums (*kachu*), different kinds of yams (*dioscorea*) and gourds, the country bean *urahi* (*dolichos lablab*), the common mallow *lafa* (*malva verticillata*) the radish *mula* (*raphanus sativus*), the sorrel *chukasag* (*rums vesicarius*) and the bringal (*solanum melongena*). Potatoes are also grown extensively in Sadiya and on the *churs* between the Brahmaputra and the Dibru, and about half the supply of the district is obtained from this quarter.

Yield and
value of
crops.

	lbs.
Sali	1,000
Ahu	800
Mustard	750
Molasses	2,400

The outturn of different crops varies according to the character of the season, and also to a great extent according to the character and level of the soil on which they are grown. The statement in the margin shows the normal yield per acre laid down by the Agricultural Department after a long series of experiments. These figures only represent a general mean, and even in a normal year there are many fields whose outturn varies largely from the average. The yield of rice, it may be premised, is expressed in terms of husked grain. Like the outturn, the cash value of the crop can only be approximately ascertained. The prices obtained by the raiyats vary to some extent in different parts of the district, but probably average about Re. 1-12-0 per maund of unhusked grain. Assuming that unhusked paddy yields 62 per cent. of clean rice, it would appear that the value of the harvest from an acre of *sali* is about Rs. 34, and from one of *ahu* Rs. 27. For mustard, the villagers generally get from Rs. 2-8 to Rs. 3 a maund so that the yield from one acre varies from Rs. 23 to Rs. 28. The price of molasses varies considerably from time to time and from place to place, and ranges from Rs. 4 to Rs. 5 per maund. The value of the yield of an acre of cane ranges accordingly from about Rs. 120 to Rs. 150.

Floods.

South of the Brahmaputra, floods do comparatively little damage. The country near the river goes under water in the rains; but this fact is well known and duly recognized, and the pressure on the soil is so light that there is no necessity as yet for attempting to bring

these less desirable portions of the district under permanent cultivation. The spill water of the Dihing occasionally submerges the lower land in the Khowang and Jaipur mauzas, and steps have recently been taken to restore a bund which was erected in the days of native rule.

North of the river, the land is more exposed to the risk of flood. In the Sisi mauza, the Sisi, the Gai, the Gutung, and the Girgiri all overflow their banks, while a great part of the Dhakuakhana and Gohaingao mauzas, which adjoin it on the west, are submerged by the waters of the Brahmaputra and the Subansiri. Low lying land in the western part of the subdivision is liable to be overflowed by the Ranganadi, the Dikrang, and their tributaries, but considerable benefit has been derived from the protective works that have recently been constructed. The population is, however, so sparse, that no necessity has as yet arisen for attempting to occupy the less desirable portions of the north bank of the Brahmaputra.

Little or no attempt has as yet been made by the villagers to improve on the methods handed down to them from their forefathers, or to introduce new crops and staples. Manure is hardly ever used except for vegetables and garden crops, such as betel-nut or tobacco ; or to fertilize the little plot of land on which the seeds of rice are sown. The heavy rainfall renders artificial irrigation unnecessary for the growth of rice on land of ordinary level, and no attempt is made to bring the water on to the fields, except in the case of a few villages

Agriculture
not intensive

near some tea gardens in the Dibrugarh tahsil. Beyond selecting the best grain for seed, the villagers make little or no attempt to improve the character of the crop; and they do not always observe even this simple rule, as in Sadiya it is said that they persist in selling all the largest potatoes and planting tubers little larger than a marble. The villagers reap a rich harvest from the coolie to whom they sell rice, country vegetables, and poultry, and show little desire to experiment with new staples. The area under potatoes is said to be extending, and jute is grown in small patches near the homestead, but only for home use and not for sale. Sugarcane was at one time found to be a paying crop and was largely planted out by the Nepalese in forest land, from which they obtained a very fine return. The area under cane, rose from 2,000 acres in 1894-95 to 5,400 acres in 1901-02; but the price of molasses quickly fell, and the profits of the industry began to disappear. The Deputy Commissioner considers that this lack of agricultural enterprise is a serious matter for the indigenous population. In spite of the large areas of rich soil ready for the plough, between five and six hundred thousand maunds of rice are annually imported into the district, at a cost of from fifteen to eighteen lakhs of rupees.

Live stock.
Buffaloes.

The buffaloes of the district belong to two distinct breeds the Assamese and the Bengali.* The Assamese are the larger of the two, and are fine upstanding

* The information given in these paragraphs is taken from a note compiled by Mr. Darrah, Director of Land Records and Agriculture in 1887, and from reports received from the local revenue officers of Lakhimpur.

animals with widely spreading horns. During the cold weather, they are generally grazed in jungly tracts, and a wild bull often attaches himself to the herd, and becomes the sire of many of the calves. This continual infusion of a good strain of blood does much to maintain the excellence of the breed. The Bengali buffalo is a smaller and less imposing animal, and does not command so high a price, a bull costing from Rs. 20 to Rs. 30; but, in Lakhimpur, the Bengali buffalo is comparatively scarce, and the fine indigenous breed still holds its own. Nepalese buffaloes are also common. They are large animals but have smaller horns and longer tails than the Assamese variety. Assamese bulls cost from Rs. 25 to Rs. 60, and cows from Rs. 50 to Rs. 60, but a Bengali cow buffalo can be purchased for Rs. 30 or 35. The price, as is only natural, is lower in North Lakhimpur and in the more out lying parts of the district, such as Jaipur and Sadiya, than in the neighbourhood of Dibrugarh.

Buffaloes rarely get anything but grass and a little salt to eat. In the cultivated portion of the district they are usually placed in charge of a small half naked boy, whose legs can hardly stretch across the massive back of the animal he bestrides, and who guides it with a nose rope. In the *chaporis*, the herd is driven out to graze in the jungle, and follows the lead of the older cows, whose whereabouts is indicated by the metal or wooden bells that are dangling from their necks. They are often trusted to return in the evening of their own accord, and a long line of animals is sometimes to be seen swimming across a channel of the Brahmaputra, which separates

them from the huts in which the graziers live. Often too, as the sun is setting, a herdsman is to be seen climbing a *simul* tree, which raises its head above the surrounding wastes of grass, to call his buffaloes home. At night each animal is fastened by a nose rope to a post, and sleeps on the bare ground. The grazing industry is not, however, of as much importance in Lakhimpur as it is in some of the lower districts of the Assam Valley. Most of the *mo-kkutis*, as these grazing camps are called, are situated in the Dibrugarh tahsil, where in the cold weather there are said to be some hundred or more of them; there are a dozen near Sadiya, some ten at Sisi, and one or two in nearly every mauza in the North Lakhimpur subdivision. A cow is said to remain in milk for about ten months, and yields at the beginning from two to four seers every day. The amount gradually decreases till a month or so before the next calf comes, when it ceases altogether. The milk is very white, and rich in fatty materials, and consequently yields a large proportion of *ghi*. The cows are said to begin breeding when three years old, and to continue doing so for fifteen years; during which time they give birth on the average to about ten calves. The normal life of a buffalo is from 25 to 30 years. Age is judged by the incisor teeth.

Cattle.

Half starved, under-sized, ill bred, and not unfrequently diseased, the Assamese cattle are but sorry creatures. The bullocks find it a difficult task to drag even the light native plough, and the cows yield but a minimum of milk. The causes of this degeneracy

are not entirely clear, but are probably to be found in a total indifference to laws of breeding, in absolute neglect, and partly perhaps in the want of suitable fodder in the rains. No bulls are set aside to be the sires of the herd, and the cows are generally covered by a young and immature animal, who secures the object of his desires by his superior lightness and agility. The sire is often closely related to the dam, and she, in her turn, has had her strength exhausted by being covered, when herself little more than a calf, and by subsequent breeding without the smallest intermission. The cattle are never groomed, and, when an epidemic breaks out, no attempt is made to isolate the sick. Everything, as Mr. Darrah says, is left to nature, from the moment when the most active, and therefore probably the youngest bull of the herd has succeeded in covering a cow, until the progeny, after years of work and semi-starvation, dies neglected in some unfrequented jungle. Cows generally cost from Rs. 10 to Rs. 15, though double that sum is occasionally paid; bullocks cost from Rs. 15 to Rs. 30. Cattle like buffaloes are cheaper on the north bank than they are in the more densely settled tracts south of the Brahmaputra.

Livestock are generally grazed on the rice *pathars* after the crop has been carried, and in swamps and marshes till the water rises. During the rains the villagers are said to experience some difficulty in obtaining fodder for their cattle in the neighbourhood of Dibrugarh, and in the country which is to some extent

Grazing
ground.

exposed to flood, such as Khowang and Jaipur and the mauzas past which the Subansiri flows. Over the greater part of the district, population is, however, still too sparse for the question yet to have assumed an acute form ; and rice straw is not as a rule collected and stored against the rainy season.

Goats and
sheep and
ponies.

The goats are almost as degenerate as the cattle. They yield but little milk, the whole of which is taken by the kids, and are only kept for food or sacrifice. At night they are usually shut up in a small out-house with a raised floor, which is approached by a slanting board or sloping bamboo platform, as a protection against jackals. There is no indigenous breed of sheep, the animals imported do not thrive, and the total number in the district is but small. The country ponies are, if anything, even more miserable specimens than the cattle. Few of them are as much as twelve hands in height, and they possess neither pace, endurance, nor stamina. European residents are compelled to obtain all their horse flesh from Calcutta.

A census of live stock was taken in 1899, and disclosed the following results. Bulls and bullocks, 51,000 ; cows 43,000 ; bull buffaloes 9,000 ; cow buffaloes 10,000 ; young stock 58,000 ; sheep 1,700 ; goats 37,000.

Cattle
disease

The most common forms of cattle disease are foot and mouth disease (*chapka*), rinderpest (*guti*), a disease called *kachua*, the principal symptoms of which are flatulence and diarrhoea, cholera, (*marki*) *matikhoa*, the first symptom of which is, as the name implies, the eating of earth followed by dysentery, and *sukuna* when

the animal refuses to eat and dies after ten days or a fortnight.

Reference must now be made to tea, which is by far the most important crop in Lakhimpur. Even judged by acreage, there is nearly one acre of tea for every two acres of rice; while if the standard of values is adopted, it will be found that the tea manufactured in the district is worth, even at wholesale prices, more than three times the total value of the rice crop.

Commence-
ment of tea
industry.

The indigenous tea of Assam was first brought to the notice of Government in 1826 by Mr. C. A. Bruce, a gentleman who had been engaged in trade in the Province while it was still under native rule, and who had been sent up the Brahmaputra in command of a division of gun boats in 1824. In 1834 a committee was appointed by Government to enquire into the possibility of cultivating tea on a commercial scale, who deputed three of their numbers Drs. Wallich, McClelland, and Griffiths to visit Upper Assam. Nurseries were established, a small establishment was entertained, under the general management of Mr. Bruce, to search the jungles for plots of indigenous tea, and cultivate them when discovered, and plants and seed were brought to Assam from China. Tea makers and trained Chinese were imported in 1837, and, in the following year, some of the manufactured product was sent to England, where it met with a most favourable reception. Assam tea was regarded as a curiosity, and the first eight chests which were put up to auction fetched sums which, at the present day, seem little short of fabulous, the prices paid

ranging from 1s. to £1-14-0 a pound. These were, however, only fancy prices, and a short time afterwards, a merchant offered to purchase tea in considerable quantities at prices ranging from 1-10½d. to 2s. a lb.

First begin-
nings in Lak-
himpur.

The following account of the first beginning of the tea industry in Lakhimpur was furnished by Capt. Bivar in 1859.*

In the district of Lakhimpore, the cultivation of the plant was first undertaken by the Government. In 1835, a few indigenous plants, taken from the forest at "Ningroo," bordering on the Singphoe country were put down on a strip of land at the "Koondil Mookh" at Suddiyah. The garden there established did not succeed. The soil, which was alluvial, was unadapted for the cultivation, and this led to a removal of material to Jaipore in the Sibsagar Division. Here the cultivation of Tea was persevered in until 1840, when, with a view to promote enterprise and the development of Tea as a resource, the Government transferred two-thirds of its Tea establishment to the Assam Tea Company. After this the Government operations were confined to a plantation in Muttock, on a spot where much indigenous Tea had been discovered, and where the soil was found peculiarly favorable to the growth of the plant.

The Government garden in the locality alluded to at Chaboah was carried on from 1840 to 1848. Over this period, whether from the Assam Tea, then a produce little known to the commercial world, not being merchantable, or from a want of skill on the part of manufacturers

* Information with regard to the early history of the tea industry has been derived from.

Letter to Commissioner No. 71, dated 8th October 1859, Selections from the records of the Government of Bengal, Vol xxxvii p. 12.

the Government plantation was an unprofitable affair, in so much that it was deemed expedient to close it, and the Barri was disposed of (sold) in April 1849, to a "Chinaman" named "Among," who purchased it with all appurtenances for Rupees 952-14-8.

For three years following, there is little to notice in the annals of Tea cultivation. The Chinaman who purchased Chaboah (at present one of the finest plantations in the district) could make little of it. Lack of energy, as much as want of funds, paralyzed his operations, and in 1851, through the instrumentality of Colonel Hannay, an officer whose exertions have contributed much to the development of Tea cultivation in this part of Assam, Chaboah changed hands, and became the property of Messrs. Warren, Jenkins & Co., for a consideration of Rupees 475.

During the time referred to above, the Chinaman was not the only failure; the period was one of depression as to manufacture of Tea. The works of the Assam Tea Company, as far as their operations in this district were concerned, were all but suspended. In their Barries little was done, rank vegetation was unchecked, and clearances were stopped. And it was not until the year 1852 that a favourable turn took place in the matter of Tea cultivation, which has since opened a prospect of wealth and prosperity for the district.

In the cold season of 1852, Colonel Hannay, who had always taken a lively interest in the products of the country, and who had a small garden close to Dibroo, where he raised cotton, sugarcane and tea, &c., for experimental purposes, having been successful in the plantation of a small patch of China Tea, increased the cultivation. Having obtained land sufficient to admit of extending his operations, in 1852 Colonel Hannay cleared and planted out about ten acres of land with Tea. At the same period Messrs. Warren and Jenkins, the proprietors of Chaboah, entered upon the formation of the Maejean Tea Barree, now a most flourishing plantation, the property of Mr. G. R. Barry, of Serajunge, and following the example first set by Colonel Hannay, an impetus was given to the extension of Tea cultivation which has led to Tea in Luckimpore having invited the attention of capitalists and to its promising fair to render the district one of the most important divisions of Assam.

In 1859, it was said that the total area taken up for

tea in Lakhimpur was 14,000 acres, of which 1,700 acres had been planted out, and yielded 282,000 lbs. of tea. Captain Bivar estimated the average value of the tea at six annas a lb., but it is difficult to believe that the price can have been as low as this.

The boom in
the early six-
ties.

1859 to 1863 was a period of steady but not abnormal or unwholesome expansion. In the latter year the possibility of making large fortunes out of tea attracted the attention of the speculating classes; and tea planting passed through a severe crisis, which was entirely due to the action of company promoters, who endeavoured to make money, not by manufacturing tea, but by hastily opening gardens to sell at most exorbitant prices to the credulous investor. The promulgation of the fee simple rules of 1861, was followed by a rush for land, which was aggravated by the orders of the Board of Revenue, who authorised District Officers to sell estates on a pen and ink sketch made by the applicant, before they had been properly surveyed and demarcated. Land thus obtained was hastily cleared of jungle, a few plants, the majority of which soon died, were hurriedly put out, and the place was sold to the unsuspecting public as a flourishing tea garden. To such a pitch was this procedure carried that there is one case on record, in which a manager received instructions from London, to clear and plant a certain area of waste land for delivery to a Company to whom it had been already sold as a tea plantation.

Scarcity of
labour.

Many of the planters, and some District Officers in Assam, thought that it was the duty of Government

to stimulate the slothful Assamese, and drive them to work on the plantations, by enhancing the land revenue assessment. This point of view did not commend itself to the Commissioner, Colonel Jenkins, who, while admitting that there was great want of industry and energy amongst the Assamese, declined to check their social improvement, or to reduce them to the unaccustomed misery of hard work, simply to provide the planters with cheap and abundant labour.*

It naturally followed that in spite of the high prices offered, local labour was not obtainable in sufficient quantities, and coolies, generally of the most miserable description, were sent up from Calcutta. The mortality in the depôts and on the journey was appalling. In the four years 1864 to 1867, the annual mortality in the largest depot ranged from 36 to 115 per cent. of the average daily strength; the latter enormous rate being calculated on a daily average of no less than 458 souls † Between 1863 and 1868, 54,352 coolies were imported to Assam, 1,712 of whom died *en route*. Even when the garden was reached, the mortality was generally high, and was sometimes quite appalling. In the Report of the Commissioners appointed to enquire into the state and prospects of tea cultivation, details are given for seven gardens in Upper Assam, on which the recorded mortality for half the year only in 1865 ranged from 16 to 39 per cent.

The returns submitted were declared by the Commissioners to be unsatisfactory, but in 1866, 4,366 deaths were

* Letter No. III dated 24th October 1839.

† Report of the Commissioners, p. 28.

recorded in Upper Assam, which was equivalent to a death-rate of 180 per mille on the total number remaining plus the total number of deaths. These days of high mortality have happily now passed away. During the ten years ending with 1889, the average annual mortality amongst adult coolies was 48 per mille, and during the next decade it sank to 42. In 1901 it was less than 31 per mille. It may, perhaps, be thought that even these are high death rates for a population of adults, and in comparison with those recorded in England this is no doubt the case. But comparisons of this sort are most misleading, as, though the death rate in Assam is very imperfectly recorded, it is certain that it largely exceeds the rate for the more civilized countries of Western Europe. It must, moreover, be borne in mind that many of the coolies are recruited from the ranks of the physically unfit, that they suffer from the effects of a change of climate, and that, when working in new clearances, they are exposed to especially unfavourable conditions. The Commisioners * in 1868 considered that the Bhutan field force furnished a fair analogy to garden coolies, and pointed out that the death rate amongst that force was 160 per mille, or very little less than the death rate even in those days on Assam tea gardens. The planters spare neither trouble nor expense in their efforts to preserve the health of their employees; and many of the weakly ones who die, would probably have lived no longer had they been allowed to remain in their own homes.

* P 56 of their report

During the tea boom, large sums were paid for labour and for seed, land which was little better than jungle was sold for preposterous prices, and the tea companies which were formed under these unfavourable conditions soon collapsed. 1866, 1867, and 1868 were years of great depression. Mr. A. C. Campbell, in a note written in 1873, describes how young men who had been engaged in England, were turned adrift when the collapse came "in a most inhospitable country without a penny or a friend; some died, others had literally to beg their way out of Assam, most had to regret impaired constitutions, and all the loss of some of the best years of their life." In 1869 affairs began to take a more favourable turn. It was seen that properly managed gardens could be worked at a satisfactory profit, and that the estates of the bubble companies, which had been bought for small prices after the great crash were doing well in the hands of their new owners. Since 1870, there has been an enormous expansion of the industry, and while the area under cultivation and the outturn have alike increased, the cost of production and the price obtained have steadily diminished. Like other industries, tea has experienced periods of prosperity and depression; but there has been no such boom with its inevitable collapse as occurred in the early sixties.

Statistics for the early years during which the industry was developing are not readily available, and are too inaccurate to deserve attention. In 1874, it is said that there were 11,680 acres in bearing, which yielded 1,812,000 lbs. of manufactured tea. In 1882

Collapse in

Expansion
of the indus-
try.

the area under mature plant was reported to be 32,952 acres; but the inaccuracy of the returns can be judged from the fact, that in 1884 it suddenly dropped from 32,897 to 25,881 acres. The cultivated area kept steadily expanding till 1896, when there were 48,152 acres under plant, with an outturn of 19,486,000 lbs. The Industry was at that time enjoying one of its periodical waves of prosperity, and capital was readily invested in its extension and development. In 1900, the total area under tea was 67,509 acres and the outturn 25,698,000 lbs. Unfortunately since then it has suffered a serious check, which was partly due to the unduly rapid increase in the out put, partly to the growing difficulty in obtaining labour, partly to the very high duty imposed on tea in England. Figures for subsequent years will be found in Table VII.

**Labour
supply.**

The supply of local labour is very limited, and the plantations have to be worked by coolies imported from other parts of India. In the ten years ending with 1890, no less than 92,000 labourers were brought up to the gardens, and in the next decade the number amounted to 149,000. The largest numbers are obtained in times of famine, the two record years being 1897 with 27,000, and 1900 with 18,400. The following abstract shows the areas from which the labour force in 1901 had been recruited.

	Total	...	...	...	Number.	Percentage.
					1,30,356	—
Arsam	...	...	...	...	26,879	21
Chota Nagpur	...	...	...	...	51,553	40
Other parts of Bengal	...	...	...	...	26,152	20
United Provinces	...	...	...	...	2,662	2
Central Provinces	...	...	...	...	17,246	13
Madras	...	...	...	...	1,945	2

The great majority of those born in Assam are the children of foreigners born after they had migrated to this Province. Natives of the United Provinces do not do well in Lakhimpur, and only a few of them have been imported to the district; and there is a large proportion of immigrants from Chota Nagpur, whence most of the finest coolies are obtained.

The journey from the recruiting districts is troublesome and expensive, the class of persons capable of working successfully in the damp climate of Assam is limited, and of recent years the supply of labour available has not been sufficient to satisfy the requirements of the planters. Special Acts have been passed to regulate the relations between the employers and their labour force. Careful provision is made for the welfare of the coolie. He is housed in neat and comfortable lines, he is provided with an excellent water supply, generally drawn from masonry wells, and when sick, he is cared for in a comfortable hospital by a native doctor working under the supervision of a European medical man. The provision of all these comforts and the importation of the labourers themselves cost large sums of money, which no one would be willing to expend without some guarantee that the coolies, when imported, would consent to remain on the plantation. This protection is afforded by the law, (Act VI of 1901) which lays down that a labourer, provided that he is well-treated, must not leave the garden to which he is indentured before the expiry of his contract, unless he chooses to redeem it by a money payment. The simpler Act (XIII of 1859), which em-

The
labourers.

powers a magistrate to order a labourer who has taken an advance, to complete the work on account of which the advance was given, is also very generally used. There are few districts in India where the tea industry is in a more flourishing condition than it is in Lakhimpur, and the prosperity of the proprietors reacts favourably upon the condition of the labourers. Wages are good, the climate is healthy, and there is an abundance of fertile land still lying waste. The cooly who has served his time can easily obtain land on which to settle down, and finds a market either for his surplus produce or his leisure hours at his very doors; as the demand for rice, vegetables, poultry, and unskilled labour is out of all proportion to the supply.

**Site of tea
gardens.**

Most of the gardens are situated a little to the east of Dibrugarh, and along the railway line as far as Talap. North of the Brahmaputra, gardens have been opened on the high lands near the hills to the east of North Lakhimpur. Further information with regard to the area, size, and population of each garden in the district will be found in tabular form in appendix A.

**Soil required
for tea.**

A friable red loam is the soil that proves most suitable for tea. The plant requires a heavy rainfall, but anything in the shape of water-logging is most prejudicial to its growth, and gardens should only be planted out on land which can be well drained. Land which, in its natural state, is covered with tree forest is usually considered the most suitable, as the absence of timber generally shows, either that the place is liable to flood, or that the soil is sandy, or that the rainfall is deficient. But in

Lakhimpur many of the finest gardens, such as those owned by the Dumduma and Sadiya Road Tea Companies, have been planted out on a light soil covered by bamboo jungle.

Four distinct varieties of wild tea are recognised: Varieties of
plant.
Assam indigenous, which has a leaf from 6 to 7 $\frac{1}{2}$ inches in length by 2 $\frac{3}{8}$ to 2 $\frac{7}{8}$ inches in width; the Manipur or Burma indigenous with a larger, darker, and coarser leaf than the preceding variety; Lushai or Cachar indigenous, whose mature leaf is from 12 to 14 inches long, and from 6 to 7 $\frac{1}{2}$ inches wide; and the Naga indigenous which has a long and narrow leaf. In addition to these four varieties there is the China plant, and different kinds of hybrids. The China tea is a squat and bushy shrub with small leaves, which gives a lower yield per acre than the other kinds. It is many years since China seed was planted out in new clearances, and considerable areas covered by this plant have been abandoned. In its natural state the indigenous plant attains to the dimensions of a tree, varying from 20 to 50 feet in height, though its girth seldom exceeds two feet. It has a vigorous growth and yields a large outturn of fine flavoured tea, but is delicate when young. Of the hybrid variety there are many qualities ranging from nearly pure indigenous to nearly pure China. A plant with a very small admixture of China is usually preferred, as this imparts the hardiness, the want of which is the one defect in the indigenous variety. During the boom in the nineties, the price of good tea seed rose to as much as Rs. 150 per maund;

but this was followed by a slump, when but a third of that sum became obtainable. The best seed in the district is obtained from the Hukanguri garden and now (1905) commands from Rs. 70 to Rs. 100 per maund, but inferior seed from village gardens is still practically unsaleable.

**System of
cultivation.**

The seed is planted in nursery beds in December and January and kept under shade till the young plants are three or four inches above the ground. Transplanting goes on between April and July, whenever there is rain, the plants being usually placed from four to five feet apart. During the first two years of their life, little more is required than to keep the plantation clear of weeds. By this time the plants are from two to four feet high, and at the end of the rains they are pruned down to fifteen inches or a foot to encourage lateral growth. In the third year the plant can be lightly plucked over, but the yield of leaf is small. Pruning is continued every year. Only about two inches are left of the wood formed since the previous pruning, and any unhealthy or stunted branches are removed. As an extreme remedy, old plants, in which there is a large proportion of gnarled and twisted wood, are sawn off level with the ground, and fresh shoots are allowed to spring from the root itself. During the rains the garden is hoed over several times, in order to render the soil permeable both to rain water and the roots of the bush. At the end of the rains the ground is hoed up to the depth of 8 or 9 inches. The object of this is to protect the land from drought, as the hoed up soil prevents the evaporation of water from the

lower strata. It also adds to the fertility of the land by exposing it to air, light, and changes in temperature. Manure has hitherto been little used. Oil cake and cowdung are sometimes spread about the plants, and exhausted land is sometimes top-dressed with rich soil from a neighbouring marsh. The cost of these operations is considerable and they are not invariably successful from the pecuniary point of view. Matikalai (*phaseolus radiatus*) is often sown amongst the bushes and hoed in as a green manure.

Plucking begins in April, and is continued till the beginning of December. The bud and the two top leaves are taken from each shoot, but fresh leaves soon appear, and in about five weeks time the shoot is ready to be plucked again. This throwing out of new leaves is termed a "flush," and there are usually six or seven full "flushes" in a season; though each bush is picked over every ten days or so, as the twigs develop at different times. The plucking is usually done by women and children, while the men are engaged in hoeing up the ground around the plants. The plant is liable to be attacked by a large number of pests, the best known being the tea mosquito or blight, the green fly, and the red spider. A full account of these pests will be found in "The pests and blights of the tea plant" by Watt and Mann, Calcutta 1903.

When the leaf has been taken to the factory it is spread out in thin layers on trays and allowed to wither. In fine weather the process takes about 18 hours, but if it is cold and wet 36 hours may elapse before the leaf

System of
manufacture.

is ready. When the leaf has been properly withered it is placed in the rolling machines. The object of rolling is to break up the cellular matter and liberate the juices, and to give a twist to the leaf. Rolling takes about three quarters of an hour, and after this the leaf is placed in a cool room for about 3 hours to ferment. It is then placed on trays in the firing machines, through which hot air is driven, until the last trace of moisture has been expelled, and the tea is crisp to the touch. The leaf is then passed through sieves of varying degrees of fineness, and the tea sorted into different grades. The best and most expensive quality is called broken orange pekoe, and is made from the bud or tip, which contains all the good qualities of tea in a more concentrated form than any of the other leaves, is stronger, and has a more delicate flavour. The other grades, which are differentiated by the size of the mesh through which they pass, are Orange Pekoe, Broken Pekoe, Pekoe, Souchong, and Fannings. After the tea has been sorted, it is fired once more to remove any moisture it may have absorbed from the surrounding atmosphere, and is packed in lead lined boxes while it is still warm. Tea loses largely in weight during the process of manufacture, and about four pounds of green leaf are required to produce one pound of the finished article.

**Outturn and
Prices.**

The character of the outturn depends largely upon the season, but still more upon the garden and the system of manufacture followed. In 1868 the Commissioner estimated that the average outturn was about 240 lbs. per acre; but this estimate was probably too low, as the

average yield in Lakhimpur during the five years ending with 1903 was 455 lbs, per acre. The introduction of machinery, and the improvement of the general system of cultivation and management have rendered it possible to effect a large reduction in the cost of the tea when placed upon the market. In 1868 it was calculated that tea must be sold at two shillings a lb. to yield a profit. Twenty years later the average price obtained by tea from the Brahmaputra Valley was 8 as. 2 pies, and, though in 1894 it rose to 10 as 5 pies, in 1898 it dropped to 6 as. 9 pies, and has since remained below that figure. Separate details are not recorded for the Lakhimpur district, but the average price obtained is, probably above the average for the valley as a whole.

The forests of Lakhimpur fall into two main classes, the reserved forests, which in 1902-03, covered an area of 340 square miles, and the unclassified state forests, which in the same year occupied the enormous area of 3,099 square miles. Unclassed state forest is, however, simply Government waste land, and does not necessarily possess any of the characteristics which are usually associated with the expression forest. It may be a sandy *chur*, or a huge expanse of low lying land covered with high grass and reeds and almost totally destitute of trees. It may be a small piece of arable land, which has been resigned by its former holder, and has not yet been settled with any other person; or it may be, what its name would naturally suggest, *i. e.*, actual tree forest. It is impossible to give even the roughest estimate of the proportion of unclassified state forest, which is actually

Forests.

under timber, but where the total area is so enormous it is obvious that, in a country with a heavy rainfall like Assam, the area covered with trees must be considerable.

**System of
management.**

The management of the Government forests is generally entrusted to a Deputy or Assistant Conservator. The unclassified state forests are, however, under the immediate control of the local revenue officials, who issue permits to settlement holders, under which they are allowed to remove a certain quantity of forest produce for their own requirements free of royalty. *

The trees are generally converted into logs in the forest, and dragged by elephants to the nearest river, whence they are floated down to the place where they are required. The statement annexed to this chapter gives in a condensed form details with regard to the situation, area, trade route, and market centre for each of the reserved forests in the district. These forests are all composed of evergreen trees, and the largest of them are situated near the Naga Hills, along the southern, boundary of the district. In the true sense of the word they are reserves, and, as yet, the requirements of the people are almost entirely met from unclassified state forests. This fact is clearly brought out by Table VIII, from which it appears that the total revenue from the

* The quantity allowed is 4 unreserved trees, 400 bamboos, 10 bundles of canes and 200 maunds of firewood, but there is in practice little check upon the quantity actually taken, and the question of abolishing the permit system and allowing villagers to take all that they need for their own use is under consideration. No restriction is imposed on the removal of thatching grass either for home consumption or for sale.

reserves in 1902-03 was only Rs. 668, fivesixths of which were obtained from the Jakai forest; while the huge Dihing reserve yielded a revenue of about 5 annas the square mile. The Jaipur forest is, however, the only reserve in which the traders wish to carry on their operations, and work is not encouraged there, as it contains little large timber of the better kind, though there is a fine young forest of Nahor, which if properly treated should be a valuable property at no distant date.

There are two minor forest products which are of considerable importance. The right to collect cane in the Government forests is put up to auction, and in 1902-03 the cane monopoly for the next five years was sold for no less a sum than Rs. 93,000. A duty of Rs. 17 per seer is levied on all rubber imported from the hills beyond the frontier, and the receipts under this head amounted to Rs. 39,000 in 1903-04. There is very little rubber remaining in the district outside the Government reserves, as the trees have been killed out by overtapping; but within these forests there are presumably a considerable number of trees, as lessees are willing to pay as much as Rs. 7,500 per annum for the right of working there, in addition to the royalty of Rs. 17 per maund of rubber found. The yield of timber and fuel, and the receipts and expenditure of the forest department are shewn in Table IX.

Cane and
rubber.

For timber required for sale, royalty is paid at the rate of Rs. 6 for each reserved tree, or 4 annas a cubic foot whichever is less, while for unreserved trees the rate is one anna a cubic foot, with a maximum of Rs. 2 for the

Timber
trees.

tree. The most valuable timber trees in the district, all of which fall in the category of reserved trees, are Nabor (*mesua ferrea*) Uriam (*bischoffia javanica*) Makai (*shorea assamica*) Hollock (*terminalia bellerica*) Gundroi (*cinnamomum glanduliferum*) Sam (*artocarpus chaplasha*) India Rubber (*ficus elastica*) and Khakan (*duabanga sonneratioides*). The Nabor has a very hard wood and is largely used for sleepers and scantlings, Hollock is used for scantlings and boats, and Simul (*bombax malabaricum*), which grows amongst the stretches of jungles grass in low lying land, is converted into tea boxes.

Timber
trade.

There are five saw mills in Lakhimpur. The Sisi mills, which employ some 350 hands, are situated in the Sisi mauza on the north bank of the Brahmaputra opposite Dibrugarh, and the Mekhlanadi and Halkatta saw mills in the Dibrugarh mauza. The Gharunia Sisi mills are in Larua mauza, and the Railway saw mills at Margherita. The tea box industry is, however, to some extent hampered by the preference which the agents in Calcutta have for boxes of foreign manufacture. Almost the whole of the timber trade is of a local character, as prior to the construction of the Assam Bengal Railway, the forests of Lakhimpur were very remote from the outside world. The tea boxes find a ready sale locally, and are sent to gardens lower down the river. Sleepers are purchased by the railway companies, and scantlings and other timber by the Municipality and Local Boards.

CHAPTER VI.

INDUSTRIES.

Coal—Oil—Iron—Gold—Lime—Silk—Pottery—Brass and bell
metal—Weaving—Fishing.

**Coal.
Early
workings.**

The existence of coal in Upper Assam has been known from the earliest period of the British occupation of the Province. In 1825, Lieutenant Wilcox reported that coal was found near Barhat, on the Disang river; and in 1828, Mr. Bruce quarried some 5,000 maunds near Safrai, which were sent to Calcutta, and pronounced to be equal to English coal and the best ever found in India. Experiments continued to be made in a desultory manner, and in 1840, the Assam Tea Company were actually working the coal measures near Jaipur. In 1861, a contractor entered into an arrangement with Government for a period of three years, under which he undertook to keep not less than 1,000 maunds of coal in store at Dikhomukh, Tezpur, and Gauhati, for which he was to receive 10 annas a maund at the first place, 13 annas at the second, and 14 annas at the third.

On the expiry of this contract, attempts were made to attract capital to the industry. The coal fields were examined and reported* on by Mr. Medlicott in 1864-65, and in 1866, a notification was issued offering grants of coal bearing strata to the public. The area of a single grant was not to exceed 640 acres, a surface rent of six annas per acre but no royalty was charged, and the land was liable to resumption if operations were not commenced within three years of the date on which the grant was made, or if work was suspended, for five years or more. Seven grants in all were made, to Mr. Goode-nough, who interested himself in the petroleum industry, and to other gentlemen, but very little work was done.† All of these grants were in consequence resumed, with the exception of the Namdang and Tirap grants, which were purchased by Mr. Haly in 1871, and ultimately sold by him to the Assam Railways and Trading Company in 1892.‡ In 1875, shortly after the erection of Assam into a separate Administration, rules were framed by the Chief Commissioner for the lease of sites for coal mining. The size of the grant was limited to 50 acres, and the holding of more than one site in the same interest

* Mr. Medlicott's report will be found in the memoirs of the Geological Survey of India, Vol. IV, Part 3.

† Less than 600 tons of coal were sold from Mr. Haly's grants in the three and a half years ending with July 1870.

‡ There was some question (1) as to Mr. Haly's title to hold this land at all and (2) as to his title to hold the grants on a surface rent, free of all royalty on the coal. It was decided in 1893, that whatever may have been the original terms of the grant, Government owing to "waiver and acquiescence" had no longer valid ground for disputing these claims. The whole question is discussed at length in Assam Secretariat R. A. Prgs. Jan. 1894, Nos. 76-123.

was prohibited. These provisions were introduced as a safeguard against the creation of a monopoly, but the opinion expressed at the time that, the terms would not prove sufficiently attractive, was found to be correct.

Report by
Mr. Mallet.

In 1876, Mr. Mallet of the Geological Survey Department examined the coal deposits of the Naga Hills, and reported, that the Makum field in all probability contained fully eighteen million tons of coal, of which at least one half must be easily procurable.*

Mr. Mallet divided the coal measures of Lakhimpur into two fields, the Makum and the Jaipur. The most easterly point to which he traced the Makum field was the south east of Kerimgao. The Dirak river was the furthest point to the west at which coal had been discovered, so that the extreme points between which coal had actually been found were 13 miles apart, though the actual length of the field was probably somewhat greater. The coal seams are imbedded in brownish grey shales and sandstones, and some of them are of considerable thickness. South east of the Leap Nadi, there is a seam of solid coal 25 feet thick, but this seems nothing in comparison with the seam in the valley of the Namdang, which consists of a solid cliff of coal, no less than one hundred feet in height. The Jaipur field is situated in the Tipam hills to the south and east of Jaipur, the most northerly point at which coal has actually been found being the Tipam garden, though it is probable, that the coal bearing strata extend to the

* Mr. Mallet's report will be found in the memoirs of the Geological Survey of India, Vol. XII Part 2.

northern extremity of the range. Only a small part of the measures appears above the alluvium, and nearly all the coal examined by Mr. Mallet was found to be of a crumbly character. The total quantity of marketable coal was estimated by him to be perhaps ten million tons ; but the data on which this estimate was formed were admittedly imperfect, and though there is undoubtedly a large quantity of coal in this field, it is impossible to express its cubical content with any approach to accuracy. No attempt is made to work this field at the present day.

The Chief Commissioner was by this time persuaded, that if these valuable deposits were to be opened up by private enterprise, more favourable terms would have to be offered to the promoters of the undertaking. The arguments in favour of this view were summarised as follows, in his letter No. 704 dated the 22nd March, 1879, to the Government of India.

Offer of more
liberal terms
by Govern-
ment.

“The rules for leasing these coal sites were sanctioned by the Government of India, but they were sanctioned experimentally only for three years, and the Government of India at the time expressed doubt, whether they would not be found to repel rather than to attract capital. The leading points in the rules are the limitation of area to 50 acres, the revenue being three annas per acre, and the royalty eight annas per ton. It is certain that, under these rules, no single application for a coal lease has been made ; and unless the indispensable preliminary of providing cheap and certain communication from the mines to the river is first undertaken by Government, it is certain that no lease will be so applied for. It can pay no one whose area is restricted to 50 acres, to undergo the requisite risks, with the certainty that competitors will profit by his failures ; nor could it pay such individual speculators to attempt the improvement of communica-

tions, the immediate effect of which would be, to introduce competitors on more favourable conditions than their own. Unless Government are prepared themselves to provide these means of communication, he is convinced that, the leases can only be profitably worked if sufficient inducement is given to a company to provide their own means of communication; and he inclines to believe that in practice, the only sufficient inducement will be a virtual monopoly of one or the other of the coal fields."

**Development
of
Margherita,** This view was accepted by the Government of India and the Secretary of State; and in July 1881, a lease was issued to Messrs. Shaw Finlayson and Company, for not more than 30 square miles in the Makum coal fields. The term of the lease was 20 years, and rent was charged at the rate of Rs. 50 per square mile, merging into a royalty of 3 annas per ton of coal quarried. A branch line was constructed connecting the collieries with the Dibru-Sadiya railway, and thus with the Brahmaputra, and work was begun on an extensive scale. In 1903, a lease for thirty years, on terms similar to those laid down in the original indenture, was granted to the Company for four square miles of land.

The result of a more liberal policy and of the enterprise of British capitalists, has been unusually gratifying. A quarter of a century ago, the hills near Margherita, and a belt of country at their feet from fifteen to twenty miles in width, were clothed with dense tree forest, the home of nothing more interesting and useful than wild beasts. Much of this forest still remains, and on either side of the railway between Makum Junction and Powai, there is hardly anything but dense tree jungle to be seen. But on the banks of the Dihing an extra-

ordinary change has taken place. The forest has been felled, the Makum garden has been put out with nearly 2,000 acres of the finest tea, a flourishing bazar has been established, and even the ubiquitous kaiya is to be found, eager here as everywhere to buy and sell. Columns of smoke curl up into the air from the saw mills and the railway workshops, and the lower hills are dotted with fine bungalows, surrounded with trim lawns and gardens. Coolies who have served in the mines, or on the tea plantation, have settled down and begun to cultivate the land, and where formerly there was a howling wilderness, there are now fields of sugarcane and rice.

The Dihing is spanned by a massive iron girder bridge, over two hundred yards in length, supported on brick pillars, and the view of the settlement from the further bank is charming, both to the lover of the picturesque and to the devotee of material progress. In the near foreground, the station is shut in by a wall of noble trees, while close behind, the hills rise in sharp serrated ridges, their sides and summits alike crowned with dense tropical forest. In front flows the Dihing, a considerable river at all seasons of the year, and between it and the forest, there is the thriving little settlement. The smoke and sounds, which are so irksome in a manufacturing town in England, here, but serve to remind the visitor of the conquest of natural obstacles, and of the kindly works of man in the midst of these primeval jungles. To the east again, the view is bounded by higher hills, whose snow crowned summits stand out in all their vivid purity in the clear air.

**The
collieries.**

The collieries are situated in a line along the lower hills about four miles south of Margherita. In the Namdang grant, the coal can be seen in a solid cliff over one hundred feet in height, the very thickness of the seam rendering it somewhat difficult to work. At Tikak, a short distance further on, coal is quarried near the summit of the hill, and further on again, there are the Ledo Valley, and Upper Ledo collieries. Work was begun at the Tikak, Upper Ledo, and Ledo Valley mines in 1882, and on the Namdang, and Tirap grants, which formerly belonged to Mr. Haly, and which pay a small dead rent in place of royalty, in 1897 and 1898. The coolies employed in the mines are housed in lines in close proximity to their work, but in this direction there has at present been little extension of cultivation. The land they say is 'sour,' and men, who have served their time, prefer to settle down near Margherita. For colliery work there is no local labour available, and coolies have to be brought at great expense from other parts of India. At first, as was only natural, the settlement was far from healthy, and the death rate was considerable. But the gradual extension of the clearings, and the elaborate precautions taken to safeguard the labourers' health, have borne good effects, and at the present day the mortality is not unusually high. In 1903, there were 1,200 coolies working in the mines under the supervision of nine Europeans, and the total output was 239,000 tons of coal. The coal is fairly hard and compact, but after extraction and exposure to the air, it breaks up into small pieces, owing to lamination and jointing. It cakes

freely, and is an excellent coal for steaming purposes, and also makes a very good coke. Very little goes to Calcutta, but it supplies all the wants of the steamer companies, a large number of tea gardens in both the Assam and Surma Valleys, and the Assam Bengal and Dacca Mymensingh Railways. Narayanganj also takes a large quantity of coal. The mines, it should be added, are worked on the square or panel system, a modification of what is known in England as the pillar and stall. The capital actually invested in the collieries is about £360,000 ; but the collieries are only one of the undertakings managed by the Assam Railways and Trading Company, which has a total called up capital of about £1,000,000.

The existence of petroleum in Upper Assam was discovered as long ago as 1828, by Lieutenant Wilcox and Mr. C. A. Bruce ; and in 1837, Major White, reported that he had found several oil springs on the Namrup river. The first lease of oil bearing strata was given to Mr. Wagentriber, a tea planter of the Lakhimpur district, who, in 1854, was granted certain rights over the oil springs at Makum, and at Bapu Pung in the neighbourhood. No steps were taken by this gentlemen to develop his property, and on the expiry of his lease, a concession was granted to Mr. Goodenough, of the firm of McKillop, Stewart, and Company to bore for oil over an area of about 700 square miles, between the Buri and Noa Dihings. The area covered by the concession was sufficiently extensive, but the rights conferred were not exclusive, and permission was reserved for other

oil.

persons to bore for oil, provided that they did not do so within one mile of works set up by Mr Goodenough and kept in actual operation. Borings were begun at Nahor Pung and Makum, and plant valued at about half a lakh of rupees, was set up near the wells; but unfortunately Mr. Goodenough died very shortly after the inception of the operations, and work was then discontinued.

**Formation
of the Assam
Oil Company**

Subsequently certain rights were granted to Messrs. Balmer Laurie and Company, to a syndicate of private gentlemen, and to the Assam Railways and Trading Company, a company who have done so much to exploit the mineral resources of the district. Borings were made, considerable sums of money were expended, and small refineries of an experimental character were erected by the Assam Railways and Trading Company, at first at Digboi in 1893, and later on at Margherita in 1896. In 1900, a company with a capital of £310,000 was formed with the object of taking over the oil concessions and plant of the syndicate and of the Assam Railways and Trading Company, and of developing the industry in a really satisfactory manner. It was found that the wells near Digboi yielded the most favourable results, and it was decided to erect a refinery in their immediate neighbourhood. Digboi at that time was nothing more than a desolate and unhealthy forest. Apart from the wells and railway line, there were no signs of human habitation or the handiwork of man, and on every side stretched mile upon mile of pathless jungle. A large refinery was

erected near the oil bearing strata, the forest in the neighbourhood was felled, and the transformation of a dense unwholesome jungle into a thriving settlement, which has been so successfully carried out at Margherita, is now to be seen in progress at Digboi. The lower hills are crowned with the bungalows of the European staff, and the smoke pouring from the chimneys of the refinery, and all the hum and bustle of the factory, seem curiously out of place in the middle of these solitudes.

The oil is found in three layers or stratas, the first between 500 and 600 feet below the surface, the second at about 1,000 feet, and the third at from 1,300 to 1,500 feet. Over each well stands a huge derrick, some sixty feet in height, its gaunt sides covered with the leaves of the tokow plant (*livistonia jenkinsonia*), the whole structure, leaves and all, being of a dreary greasy black, the results of the spouting of the oil. The topmost lengths of steel casing put down the wells are as much as fourteen inches in diameter, but as the well progresses they gradually decrease in size, till at the bottom they are often not more than four and a half inches wide. From the top of the wells, long metal pipes lead to a central tank, creeping across the inequalities of the hills like monstrous snakes, and finally rearing their heads against the iron wall of the tank, to vomit their contents into the seething mass below. Vomit is a literal description of the way in which they discharge themselves of their burden, which come rushing out in short bursts and gasps, a curious

The raw
material.

pitchy mass like greenish mud, dusted over with a red powder from the condensing gas. There are altogether twenty-two wells near Digboi, but some five or six have been abandoned as they were not sunk to a sufficient depth. The deepest well goes down no less than 1865 feet, but does not yield as much oil as some that are little more than half as deep.

**System of
manufacture**

The crude oil is conveyed by pipes into two huge storage tanks, each of which contains some 60,000 gallons, and is then subjected to various processes of distillation. The vapour that comes off from the first boiler condenses into oil which contains naphtha and petrol, and the residue passes by gravitation into a second boiler. The vapour that comes off from the second boiler condenses into an impure form of kerosine (a), and the residue is carried to a pot still which is gradually heated till it becomes red hot. The vapour which is given off during this process condenses into a heavy oil containing paraffin wax (b), while the residue bakes into a hard coke, which is broken up and removed from the still after it has cooled. The impure kerosine (a) is then mixed with the heavy oil (b), and the product is treated with sulphuric acid and caustic soda and redistilled. The vapour that comes off condenses into kerosine oil, which, after being again treated with sulphuric acid and caustic soda, is ready for use, while the residue is heated in a pot still till it gives off a heavy oil containing wax. This oil is then passed through huge drums with a refrigerating chamber in the centre, and the cold causes the wax to crystallize, so that the oil

and wax leave the drums in a sort of buttery mass. This semi solid product is then forced through layer after layer of cloth which collects the wax and allows the oil to run off. The oil is then treated with sulphuric acid and caustic soda, and redistilled. The first vapour to come off is a light burning oil which is mixed with the impure kerosine (a), the second product is an intermediate or fuel oil containing paraffin, the third a lubricating oil. The lubricating oil is still, however, carrying too much wax, so once more it is passed through the refrigerating drums and layers of cloth, and it is only then, after it has been concentrated to remove the higher oils, that it is fit for use.

The wax is sweated in steam chambers to remove the oil and part of the colouring matter, mixed with animal black, boiled, passed through presses to still further clean it, and then cooled in trays. Part of it is shipped to England thus in bulk, and part is manufactured into candles. The total output in 1903, was 63 tons of candles, 573 tons of paraffin wax and 1,200,000 gallons of kerosine oil. Nearly all of the oil is sold locally in Assam or in the neighbouring districts of Bengal. A list of the different places, in which oil had at that time been found, is given in a paper published in 1876, in the memoirs of the Geological Survey of India Vol. XII Part 2 page 89.

Clay iron stones occur in the coal measures, and as much as 40 per cent. of iron, has been found in a sample obtained from the neighbourhood of Tirugao in Sibsagar. According to Mr. Mallet, there is a large quantity

Iron.

of ore scattered through the measures, and enough could be procured to keep any number of native furnaces going. It is, however, more than doubtful whether the supply obtained in any one locality would be sufficient to feed an English blast furnace.* Under native rule there was a considerable iron industry in Upper Assam. But according to Colonel Hannay, the workers, who numbered about 8,000 during the zenith of the Ahom power, did not exceed 100 after the Burmese invasion; and iron smelting is, at present, a lost art in Lakhimpur. Specimens of iron pyrites have been obtained from the Mishmi Hills, but inaccessibility, lack of labour, and the uncivilized character of the hill men render it quite impossible to work these deposits.

Gold.
Native
methods.

Gold dust is found in the Brahmaputra and its tributaries, and under Ahom rule certain communities were compelled to furnish the Raja with this precious metal. The amount obtained is said to have been considerable, and Rajeswar Singh (1751-1769. A. D.) is reported to have taken as much as 2,500 oz. of gold every year from the people of Upper Assam.†

The following system was usually employed. The gold washers selected a gravelly shore opposite to a falling bank, where the current flowed fast round a corner. The stream was diverted over the selected spot, till the surface sand had been washed away and the gravelly strata exposed, and was then turned back into its

* Memoirs of the Geological Survey of India. Vol XII, Pt. 2, P. 93.

† J. A. S. B. Vol 7. P. 621. It is from this source that the following description of the system employed by the gold washers has been taken.

former channel. The auriferous sand was thrown on to a bamboo strainer placed over a wooden trough, and water was poured over it, the trough being tilted at a slight angle, so that the water and lighter substances ran off, while the gold and the heavier matter remained at the bottom. When a sufficient quantity of this matter had been collected, it was placed in another vessel, and quicksilver added to attract the grains of gold. The mixture of quicksilver and gold was then put in a shell and placed on a fire. The shell was converted into lime, the quicksilver evaporated, and the gold was left lying in the lime. The lime and gold were then thrown into a vessel full of water, when the precious metal at once sank to the bottom.

In 1852, Capt Dalton reported that the sands of the Sisi river were highly auriferous. Twenty grains of gold was not an unusual return on one day's labour by three men, who between them could wash about a ton of rubble; and 11 grains were extracted from 22 cwt of gravel in his presence. This report was confirmed by Mr. C. C. Campbell, who declared that the yield was considerable, though the profits were absorbed by the purchaser of the gold mahal, and the people who advanced the capital to the actual washers.* In 1882 a ten years lease was granted to a European of the right to wash for gold in the Subansiri and its tributaries. It was hoped that he would make some attempt to ascertain the source from which the precious metal was

European
investiga-
tions-

* Note recorded by Mr. T. G. Murray in 1877. R. A. Progs. August 1893' Nos 46-74,

derived, and the possibilities of developing the industry ; but nothing of the kind was done, and an application for the renewal of the lease was summarily rejected. In 1894, a syndicate was formed, and a considerable sum expended in the exploration of the rivers of Lakhimpur. But gold was not found any where in paying quantities and no return was obtained on the capital expended. In 1901, a prospecting license was issued to Messrs Winsland and Sutton, for a portion of the Subansiri, but, on receiving unfavourable reports from a mining engineer on the prospects of dredging in that river, they resigned their license in the following year.

**Mr.
Maclaren's
report.**

In the cold season of 1903-04, the auriferous rivers of Assam were regularly examined by Mr. Maclaren of the Geological survey of India.* He visited the Buri Dihing, the Junglu Pani, a small stream which rises in the Tipam Hills and falls into the Dihing about eight miles below Margherita, the Tengapani, the Brahmaputra above Sadiya, the Dibang, the Dihang, and the Subansiri. In every one of these rivers gold was found, but in the great majority of cases the quantity was insignificant, and was seldom as much as one grain to a ton of gravel. The best results were obtained at the Dirpai bar on the Subansiri, at Gurimara near Chunpura on the Brahmaputra, and at Sibiyamukh on the Dihang. Neither of the two latter places was, however, thoroughly examined.

At Dirpai no less than $7\frac{1}{2}$ dwt. of gold were obtained

* His report will be found in the memoirs of the Geological Survey of India Vol. XXXI, Pt. 4.

from about $8\frac{1}{2}$ tons of sand; but with proper appliances the yield would probably have been about 10 dwts or 28 grains from every 23 cwt. of sand. This was considered by Mr. Maclaren to be a payable yield of precious metal, and the nature of the gravel offers no serious hindrance to successful dredging. On the other hand it must be borne in mind that operations cannot be carried on when the river rises in the rains, that the extent and depth of the deposit are unknown, and that it is doubtful whether the supply of gold, deposited each year when the river rises, would equal the amount removed during the previous season's operations. The Assam gold is of a fine quality, and the evil reputation it enjoyed in the days of native rule seems to have been due to the admixture of an excessive proportion of alloy. The grains are extremely small, and the gold was in all probability originally derived from the quartz veins of the metamorphic and gneissic schists of the higher ranges. From here it was washed into the Tipam or Sub-Himalayan sandstones, which were probably deposited by a river system not greatly dissimilar in direction from that at present in existence.

Boulders of limestone are found in the bed of the Digaru, a river which falls into the Brahmaputra about 20 miles north east of Sadiya. The stone is brought down the Digaru when the river is in spate, and to judge from it's rounded appearance, must have come from a considerable distance. Some sixty or seventy thousand maunds are collected every year, but the difficulty of transit up and down the Brahmaputra is a

Lime, kaolin
salt

serious obstacle to the development of the trade. A thick deposit of kaolin resting upon white quartz occurs near the Brahmakund, and salt springs are found in the coal bearing strata, but are very little used.

**Manu-
factures.**

The indigenous industries of Lakhimpur are not of much importance. Several hundred Europeans and many thousand natives obtain a living from the cultivation of the tea bush, and large sums of money are annually paid in England as interest on the capital invested in the undertaking. This industry is, however, almost entirely supported by British capital, and for every acre of tea in the district held by a native of the country, there are forty owned and managed by Europeans. The coal mines and oil wells, to which reference has been already made, are striking instances of the way in which wealth can be extracted from the very midst of the jungles; but, as far as the natives of the district are concerned, these valuable deposits would have remained untouched till the crack of doom. The saw mills, the brick and pottery works at Margherita, and the railway work shops at Dibrugarh are all the creations of European enterprise; and the indigenous arts and industries are, if any thing, even less important than they are in the other districts of the Assam Valley. They consist of the rearing of silk worms, the weaving of cotton cloth on the hand loom, and the manufacture of rough pottery, daos and knives, and brass and bell-metal utensils. A brief account of these cottage industries, and of the fisheries of the district is given in the following paragraphs.

Pat Silk.

Three different kinds of silk are produced in the

district. The most valuable kind is known as *pat*, and is obtained from the cocoon of two species of worms, the univoltine or *bor polu*. (*bombyx textor*) and the multivoltine or *horu polu* (*bombyx croesi*) but only the former worm is reared in Lakhimpur. Both kinds are reared indoors, on the leaves of the mulberry tree, (*morus indica*.) The eggs of the *bor polu* take ten months to hatch, the worms usually making their appearance about the beginning of January. The life of the worm lasts from thirty to forty days and the cocoon takes about six days to spin. The cocoons are of a bright yellow colour, but the silk, when boiled in potash water, becomes perfectly white. From twelve to fifteen thousand cocoons are required to yield one pound of thread, which is worth about Rs. 12. The *pat* worm is considered impure and is only reared by Katanis. The total annual out put of the district is said to be some 12 seers of thread, which is spun in the Madarkhat mauza.

The *muga* worm (*antheroea assamoea*) is generally fed on the *sum* tree (*machilus odoratissima*.) Five different broods are distinguished by vernacular names, but the only broods commonly reared in Lakhimpur, are the *jarua* in December-February, and the *jethua* in the spring; the latter being by far the more important of the two. The complete cycle of the insect lasts from 54 to 81 days, the bulk of which is occupied by the life of the worm. When the moths hatch out, the females are at once attached to straws which are hung up inside the house, and are visited by the males, who are allowed to remain free for three or four days

Muga.

Each female produces about 250 eggs which are placed in a dark place, and when the worms appear they are at once transferred to the *sum* tree. A band of straw or plaintain leaves is fastened round the trunk, to prevent them from descending, and during the night they take shelter under the leaves. Constant vigilance is, however, required to keep off crows, kites, owls, large bats, and other pests which prey upon the worm, and hail and heavy rain not unfrequently do damage. When fully grown, the worm is about 5 inches long and nearly as thick as the fore finger. In colour it is green, with a brown and yellow stripe extending down each side, while red moles with bright gold bases are dotted about the surface of the body. When the worms are ready to spin, they descend the tree and are then removed to the house. Most Assamese women possess one or more garments of *muga* silk, and well-to-do men wear waist cloths of this material on occasions of ceremony. *Muga* silk is chiefly manufactured for home use, and very little is produced for sale. The principal centres of cultivation are the mauzas situated on the north bank of the Brahmaputra. The silk is reeled from the cocoon, 250 of them yielding one ounce, of thread. The price obtained is from Rs. 6 to 12, per seer.

Eri silk.

The *eri* worm (*attacus ricini*) derives its name from the *eri* or castor oil plant (*ricinus communis*) on which it is usually fed. Patches of this plant are to be seen in the gardens of most villagers, and the worm is proportionately common. From five to six broods are usually reared in the year; those which

spin their cocoons in November, February, and May yielding most silk. As with the *muga* moth, the females, when they emerge, are tied to pieces of reed, and are visited by the males who are left at liberty. The eggs are hatched in the house and take from a week to fifteen days to mature. As soon as the worms appear they are placed on a tray, which is suspended in a place of safety, and fed on the leaves of the castor oil plant. When fully grown, they are about $3\frac{1}{2}$ inches long and of a dirty white or green colour. After the final moulting, the worms are transferred from the tray to forked twigs suspended across a piece of reed, and, when they are ready to spin, are placed on a bundle of dried plantain leaves or withered branches which is hung from the roof of the hut. The matrix of the cocoon is very gummy, and the silk, which is of a dirty white colour, has to be spun not reeled off. Before this is done, the cocoons are softened by boiling them in water and a solution of alkali. Empty cocoons yield about three quarters of their weight in thread. Eri silk is produced in almost every village, but the thread is required for home use and very little is sold. The Borborua hát, seven miles west of Dibrugarh, is the chief centre of such trade as there is in this product.

The most useful garment made of *eri* silk is the *bor kapor*, a large sheet sometimes as much as 20 feet in length by 5 feet wide, which is folded and used as a wrap in the cold weather. It costs from Rs. 10 to Rs. 16. *Eri* cloth is also made into coats and petticoats.

Cost of silk
clothes.

Women's clothes, both petticoats and the shawls worn over the bust, are however usually made of *muga* silk, the thread required for a complete dress costing from Rs. 5 to Rs. 7.

Pottery.

Very little pottery is made in Lakhimpur, and in 1901 there were less than 200 persons in the district supported by the making and selling of earthenware vessels. The earth used is generally a glutinous clay, which is well moistened with water and freed from all extraneous substances. If it is too stiff some clean coarse sand is worked up with it. A well kneaded lump of clay is then placed on the wheel, which is fixed horizontally and made to rotate rapidly. As the wheel revolves, the potter works the clay with his fingers and gives it the desired shape. The vessel is then sun dried, placed in a mould, and beaten into final shape with a mallet, a smooth stone being held the while against the inner surface. It is then again sun dried, the surface is polished, and it is ready for the kiln. The collection of the clay and firewood, the shaping of the utensils on the wheel and the stacking of them in the kiln, form the men's portion of the work. The women do the polishing and the final shaping. The Hiras, however, do not use the wheel, but mould the vessel on a board, laying on the clay in strips, and the whole of this work is entrusted to the women.

The instruments employed are the wheel (*chak*) which is about three feet in diameter, and rotates on a

piece of hard pointed wood fixed firmly in the ground, the mould (*athali*), a hollow basin about 60 inches long by $3\frac{1}{2}$ inches deep, the mallet (*baliya piteni*) and the polisher (*chaki*.)

The principal articles manufactured are cooking pots (*charu*) cups (*mola*) water jars (*kalah*, *tekeli* and *thali*) and larger vessels (*hari* and *janga*) with lamps, pipes and drums. The profits of the business are said to be small, and the local pottery is being gradually ousted by a superior quality of goods imported from Bengal, and by metal utensils which are coming extensively into use. The principal centres of the industry are at Dibrugarh, Madarkhat, Margherita, Tinsukia, and Chabua.

The brass and metal industry is not of much importance. Its principal centres are at Japaragaon, Tekelasing, Bokalmajgaon, Japi Hojia, Ghorbund, and Jarwa, but the number of craftsmen, all of whom are Morias, is very small. Bell metal utensils are cast in moulds, but brass vessels are made out of thin sheets of that metal which are beaten out and pieced together. The implements of the trade consist of anvils of different sizes (*belmuri chatuli*) hammers, pincers, and chisels. The furnace is simply a hollow in the floor of the hut, and the bellows are made of goat's skin. When it is desired to join two sheets of brass together, nicks are cut in one edge, into which the other edge is fitted, and the two are then beaten flat. A rough paste made of borax and *pan*, a substance which consists of three parts of sheet brass with one part of solder, is then

Brass and
Bell-metal.

smeared over the join. The metal is heated, the *pan* melts, and the union is complete. The principal articles manufactured are small flattish bowls often used as drinking cups (*lota*,) jars for holding water (*kalsi*, *gagari*,) trays (*sarai*) boxes to carry lime (*temi*,) and large vessels used for boiling rice (*thali* and *hata*.) Daos and knives are also manufactured here and there by blacksmiths, who are either foreigners, or, if they are natives of Assam, only follow this profession after the harvest has been reaped, when their fields do not demand their personal attention.

Weaving. Amongst the Assamese the weaving of cotton cloths is carried on by rich and poor alike, and a loom is generally to be seen in the courtyard of the house. Though cotton is grown in the hills of the Province, and though many different dyes are to be found growing in its forests, the material employed is almost invariably imported yarn, which is obtained in the requisite shades from the village shop. The loom consists of four stout posts, which are driven into the ground so as to make a rectangle about 5' 10" $\times$ 2' 6", and are joined together at the top by cross beams. The object of the loom is three-fold. First it has to support the warp horizontally at a moderate tension, secondly it has to hold the frame containing the reed suspended in such a position that it can readily be driven backwards and forwards to consolidate the weft, and thirdly it has to supply an arrangement to work the healds which raise and lower the threads of the warp. The implements required for the conversion of raw cotton into cloth, and the system

of manufacture followed, are described in the minutest detail in a " Monograph on the Cotton Fabrics of Assam " published by the Superintendent of Government Printing at Calcutta in 1897. Descriptions of mechanical processes of this nature are at their best unsatisfactory, and are hardly intelligible without a series of diagrams. Those curious on the subject would do well to consult this monograph, in which the whole subject is discussed with an elaboration and detail, which would be quite unsuitable in a gazetteer. The total cost of the whole apparatus is about ten rupees, and, as weaving only occupies the leisure moments of the women, the use of home made clothing helps to save the pocket of the villager. Very little cotton cloth is prepared for sale, and there can be little doubt that weaving, as an industry, is commercially a failure; the price obtained for the finished article being out of all proportion to the time expended on its production. The principal articles made are *churias* or waist cloths, large sheets or shawls worn as wraps, called *chadar*, or *bor kapor*, and smaller shawls, called *chelengs*. A kind of shawl called *paridia kapor* is very finely made, and is enriched with a beautifully embroidered border. It costs sometimes as much as Rs. 200. Amongst the indigenous inhabitants, the clothing of the women used originally to be always made at home, and consisted of a plain petticoat (*mekhla*) and a species of scarf (*riha*) worn over the bust. Imported goods are, however, beginning to oust the home made fabrics, and the loom is gradually falling into disfavour.

The fishing industry.

All classes of persons catch fish for their own consumption, but the Doms or Nadiyals are the only caste who will consent to catch it for sale. The most important fisheries in the sadr sub-division are the Brahmaputra, Dihing, Dibru, Sesa, and Bari Suti rivers, and the Gharukuti *bhil* in the Dibrugarh mauza, the Larua, Chaparu, and Kawaimari *bhils* in the Jamira mauza, and the Romai *bhil* in Madarkhat. In North Lakimpur the chief fisheries are the Luhit, Charikaria, Ghagor, Ranganadi and Khatali, but none of them are of very great importance, and the total revenue realized from fisheries in the district is, as a rule, only about Rs. 8,000 per annum. Fresh fish is exported from Dibrugarh to Dum Duma and other places on the line of railway, but no attempt is made to salt or dry it. The kinds which are most esteemed for the table are the roe (*labeo rohita*) the chital (*notopterus chitala*), the mahseer (*barbus tor*) the ari (*arius*), the magur (*clarias magur*), the pufta (*callichrous bimaculatus*) and the sol.

The following are the nets most commonly in use. (1) *Ghakata*, a net in the shape of a shovel which is pushed through the water, and is generally used to catch *butchua* fish, (2) *khewali*, a piece of netting to the centre of which a rope is attached while all round the edges there are weights. The net is thrown flat on to the surface of the water, when the weights sink and drag the sides of the net together, and the fish are entangled in pockets along the edges. It is then drawn by the rope to a boat or bank. The following names are applied to this net as the mesh decreases

in size, *sayani*, *pachani*, *afalia*, *angtha*, *ghanjal*. (3) *langi*, a large net which is stretched right across a river, the bottom being weighted and the top buoyed. The fish are then driven towards the net and become entangled in its meshes. The *tenga langi* is a smaller variety, the two ends of which are brought round to form a circle, as the net is not long enough to reach across the river. (4) *parangi*, a square net, the opposite corners of which are fastened to flexible bamboos. The net thus hangs like a sack from a stout pole to which the bamboos are attached, and is lowered into the water and raised at intervals. The villagers also fish in shallow water with wicker traps *polo* and *jokai*, and place other traps (*sefa* and *gui*) which are worked on much the same principle as the lobster pot, in running streams.

The right to fish in each of the larger fisheries is every year put up to auction. The purchaser of the fishery finds the task of realizing his dues much simplified by the fact that the Nadiyals are the only caste who fish for sale. Private persons are supposed to pay him a small fee for catching fish for their own consumption, but in practice, this is seldom realized. The mahaldar knows who will fish in the length of river purchased by him, and distributes the auction price of the fishery rateably over each adult fisherman, charging him in addition one or two rupees to cover the cost of collection, and as interest on the payment made to Government, before the full value of the fishery has been realized. Sometimes the same principle is followed in the case of *bhils*, sometimes the fishermen keep

accounts of the value of the fish sold and one-eighth of the gross receipts is taken by the mahaldar; a proportion which does not seem excessive, as he is responsible for any loss which may accrue. The fact that the mahaldar is always a Nadiyal of local influence, and that he only has to deal with his fellow caste men, has much to do with the harmonious working of the system.

CHAPTER VII.

ECONOMIC CONDITION OF PEOPLE—COMMUNICATIONS—TRADE—TOWNS—LOCAL BOARDS.

Rent—Wages—Prices—Food and dress—Dwellings—Condition of people—Social restriction—Isolation of Assam—Development of steam navigation—Railways—Roads—Water communications—Post and telegraph—Trade—Towns—Local Boards.

The area of Government waste available for settlement in Lakhimpur is very large, the area of land held by native landlords free of revenue, or at half rates, is extremely small, and as a natural consequence, the great majority of the cultivators hold direct from Government.

Rent.

Statistics of subtenancy were compiled in 1899–1900 and are summarised in the following abstract:—

Name of subdivision.	Total settled area for which returns were compiled.	Total area sublet.	Area paying produce rents.	Area paying cash rents.
	Acres.	Acres.	Acres.	Acres.
Dibrugarh ...	120,405	2,659	34	2,625
North Lakhimpur ...	29,956	1,159	31	1,128
Total ...	150,361	3,818	65	3,753

It will be seen that only two per cent. of the area for which statistics were collected in Dibrugarh, and four

per cent. of the area in North Lakhimpur was held by tenants; and that the amount of land held on condition that the tenant should make over half the produce to the landlord (*adhi*.) was absolutely inconsiderable.

Though the area sublet is comparatively small, the rents charged are for Assam fairly high. As much as Rs. 9 per acre is sometimes paid for rice land, and about half the land sublet pays a rent of Rs. 6 per acre, or fully twice the Government revenue. This is due to the fact that Lakhimpur is to some extent an industrial district, so that land near Dibrugarh or the great tea centres acquires a special value. Coolies who have saved a little money often like to settle down near the estate on which they were employed, so that they can still earn wages during the time when they are not actively engaged in their own fields. For people of this class, it is more economical to rent land and pay the landlords profit, than to move to the Government wastes in the remoter portions of the district.

About one third of the land sublet was held by persons who only paid the Government revenue; but these tenants, as a rule, render small services to their landlords, who otherwise would derive but little benefit from the arrangement. Low land on tea estates is generally let out to coolies for cultivation, but such persons would not be returned as tenants either in the revenue or census tables. The last decade witnessed a large increase in the number of tenants, the figure having risen from 1592 in 1891 to 6094 in 1901, but there is nothing in this fact to cause anxiety. There is land enough and

to spare for all, and if a person wishes to occupy a piece of land in a favourable situation, that has been already taken up, it is only right that he should pay for it.

The proportion of gentle folk who are unable to cultivate with their own hands is small, the number of ex-garden coolies who are not too proud to labour is considerable, and the difficulty of obtaining men to plough or reap the harvest is not as great as in some of the other districts of Assam. It must not, however, be supposed from this, that labour is either cheap or plentiful. Most of the local revenue officials agree in saying that it is still difficult to get labour, and this is the view of the Deputy Commissioner, who writes as follows on the subject. "My experience is that it is just as difficult to get Assamese to work in Lakhimpur as in other districts of Assam. The ex-garden cooly, unless tempted by high wages, at a time entirely in accord with his own convenience, will not usually work away from the immediate surroundings of his old estate. The rate of wages usually demanded, i.e., six annas per diem does not command even a limited supply of regular labour." The general rate of wages seems to be from six to eight annas per diem, though in North Lakhimpur, and in the mauzas on either side of the railway line, between Rohmoria and Rangagora, the rate is lower, and unskilled labour can be obtained for four or five annas a day. Servants are not generally hired by the month, but when they are, receive from Rs. 3 to Rs. 7 in cash in addition to their food. In the south of the district, Nagas will sometimes undertake

Wages

to work for hire. Elsewhere the labouring classes are recruited from the cooly immigrants or from Assamese impoverished by the abuse of opium. The wages of carpenters are said to range from 10 annas to 2 rupees a day, masons get from 8 annas to one rupee, while blacksmiths are paid from 10 annas to Re. 1-8-0. Nearly all these artizans are foreigners, as the Assamese display no aptitude for the handicrafts.

Prices.

The statement in the margin shows the average price of rice in each of the four decades ending with 1902. It is many years since the cultivators of Lakhimpur produced enough grain to feed the immigrant population, and the price of rice depends on the price at which it can be imported from outside. During the last forty years, it has shewn a general tendency to appreciation, but this tendency is not so marked as in other districts, for the simple reason that even forty years ago rice in Lakhimpur was far from cheap.* For the same reason the market keeps extremely steady, and during that period there was only a difference of 7 seers between top and bottom prices, as compared with a difference of 29 seers in Sylhet. Salt has been fairly steady at 8 seers for the rupee, which is considerably cheaper than it was in the sixties, when only 6 seers could be purchased for that sum, but in 1903 the price fell to 10 seers for the rupee. The price of pulse will be found in Table X.

Average.	Seers per Rupee.
1863-1872 ...	14'2
1873-1882 ...	11'1
1883-1892 ...	12'7
1893-1902 ...	10'7

*. 1863. Seers of rice per Rupee : Sylhet and Cachar 32, Goalpara 25, Kamrup 23, Lakhimpur 15.

The staple food of the people is boiled rice, eaten with pulse, spices, and fish or vegetable curry. Amongst the well-to-do, pigeon or duck occasionally take the place of fish, but fish is a very common article of diet, and is said to be a substitute for *ghi*, which is not very largely used by the indigenous inhabitants. Goat's flesh is eaten by Muhammadans and members of the Saktist sect, and venison is always acceptable, and is frequently procurable, especially in times of flood, when the deer are driven on to islets of higher land, and are ruthlessly slaughtered from boats. Tea drinking is very common, especially in the early morning. Sweetmeats usually consist of powdered grain mixed with milk, sugar, and *ghi*. The ordinary form of dress for a villager is a cotton *dhoti* or waistcloth, with a big shawl or wrapper, and sometimes a cotton coat or waistcoat. Women wear a petticoat, a scarf tied round the bust, and a shawl. Amongst the Assamese these cloths used formerly to be made at home, and in the case of the women, and of the large wraps worn in the cold weather by men, are frequently of silk. The actual cost to the family of cotton cloths is very small, but the silken wraps of the well-to-do are often beautifully embroidered, and the finest shawls are sometimes worth as much as Rs. 200. Foreigners wear cheap imported cotton *dhotis* and *saris*, blankets, and ready made coats, and the use of these articles of clothing is spreading amongst the Assamese. This change of fashion is unfortunately accompanied by a tendency to neglect the cottage loom, and in places the village women are beginning to forget the weaver's

art. This is to be regretted, as the time that was formerly spent on weaving is not now employed on any other profitable occupation. A curious article of dress worn by the Assamese is a large flat hat, called *jhapi*, which serves as a protection against the sun and rain, and is made of leaves and split bamboo, and decorated with coloured cloth. These hats are circular in shape, and range from two to six feet in diameter, but those of the larger size are more often carried than worn. Boots and shoes are the exception, and, in their own homes, even well-to-do people wear wooden clogs. Wooden sandals are also used by villagers, when travelling or working in jungle ground, where there are tufts of sharp-pointed grass.

Dwellings. The homestead of the ordinary peasant is generally separated from the village path by a ditch or bank, on which there is often a fence of split bamboo. Inside, there is a patch of beaten earth, which is always kept well swept and clean. Round this tiny courtyard stand two or three small houses almost huts, and in a corner there are generally two open sheds, one of which contains a loom, while the other serves the purpose of a cow-house. The whole premises are surrounded by a dense grove of bamboos, plantains, and arecanut trees, and there are often numerous specimens of the arum family covering the ground. The general effect is picturesque enough, but the presence of all these plants and trees makes the whole place very damp, and excludes all sun and air. At the back there is usually a garden in which vegetables, tobacco, and

other plants are grown. The houses are small, dark, and ill-ventilated, and must be very hot in summer, and as they are built on low mud plinths are extremely damp in rainy weather. The walls are made of reeds plastered with mud, or of split bamboo, the roof of thatch, the rafters and the posts of bamboo. All of these materials can, as a rule, be obtained free of charge, and a house costs the owner nothing but the trouble of erecting it, but in spite of this, they are small and badly built. The houses of the middle class are built on practically the same plan, but they are larger, and wooden posts and beams are often used in place of bamboo. The furniture of the cultivating classes is very simple, and consists of a few boxes, wickerwork stools and baskets, brass and bell-metal utensils, and bottles and earthen pots and pans. The villager's bedding is a quilt made out of old cloths, and he either sleeps on a mat on the damp floor, or on a small bamboo *machan* or platform. The well-to-do have beds, tables, and chairs in their houses, but these articles of luxury are seldom found outside the town. This style of house is common to Bengalis and Assamese, but, in the flooded tracts, there are none of the graceful areca palme, as the tree cannot thrive if the roots remain long under water. These orchards and gardens are a considerable source of wealth to the cultivator, and a house, standing on a bare patch of ground, has always a somewhat poverty stricken appearance to eyes accustomed to the luxuriant vegetation in which the typical Assamese cottage is embedded.

**Economic
condition of
the people.**

The villagers in Lakhimpur are surrounded by all the conditions that make for material prosperity. The soil is fertile and there is abundance of waste land still available for settlement, the rates of revenue are not excessive, the rainfall is certain and abundant, and the public health is good. There is no lack of communications, and, most important of all, the people have a never failing market at their very doors. In 1903-04 nearly 57½ lakhs of rupees were paid away in wages to garden coolies in the sadr subdivision, or Rs. 33 for every man, woman, and child living outside the gardens. A large proportion of this enormous sum came no doubt into the hands of the Marwari merchants, and some is spent on liquor, but the amount that changes hands at the village markets must be considerable. The cooly is ready and willing to buy all that the cultivator will sell, whether of rice, vegetables, molasses, poultry, or live stock; and if the villagers are not well off, it is difficult to resist the conclusion that they themselves must be to blame. A striking feature of these markets is the large proportion of foreign vendors, and of regular shop keepers. Here, as elsewhere, the Assamese are apparently allowing much of the profits of agriculture to slip through their fingers, and instead of taking their own rice to market, they sell to the middle man who makes a large turn on the transaction. The standard of comfort is not very high, but a large proportion of the Assamese population consists of Ahoms, Chutiyas, and the humbler Hindu castes, who have not been richly endowed by nature either with intelligence

or enterprise. There is no accumulation of wealth, and few amongst the Assamese could be described as even moderately well-to-do; but even the local revenue officials admit that there is very little indebtedness in the sadr subdivision.

Opium, no doubt, levies a heavy tax upon the people. In 1900, 374 maunds of opium were issued from the treasury, which must have cost the actual consumers at the shops no less than Rs. 6,75,000; a sum more than a lakh in excess of the total land revenue of the district. A certain proportion of this opium was no doubt taken by the hill tribes, but after making every allowance for this factor, it is obvious that the drug must be a serious drain upon the pockets of the consumers. Opium, moreover, tends to impoverish the people in two ways. The man who is a large consumer of the drug is not only compelled to pay heavily for his pleasure, but its use tends to deprive him of that spring and keenness, which is essential in a people who are to advance far on the path of material progress. In North Lakhimpur, the tea industry is of less importance, and the wages bill in 1903-04, only amounted to a little over five lakhs of rupees. Even this was equivalent to seven rupees per head of the population in the villages, and it is obvious that a large proportion of this money must ultimately find its way into the pockets of the people. The local revenue officials assert that about half the population of the subdivision are in debt, but it seems hardly probable that this can really be the case. If the condition of the people is

actually as bad as is represented, it is difficult to resist the impression that they are themselves responsible. This is practically admitted by one mauzadar, who says that the villagers eat opium and are so weak that they prefer to live by begging to taking work on tea gardens. Some of the villagers undoubtedly are living in a very miserable style, but poverty of this kind is simply due to the idleness and apathy which induce a man to continue living in a miserable cottage instead of taking the trouble to repair it. The rate of interest demanded varies from $37\frac{1}{2}$ to 75 per cent. per annum, the lower rates being charged for loans of Rs. 100 and upwards. In addition to the money they obtain by selling their surplus products to the garden coolies, the peasants add to their resources by taking petty contracts for house building and similar work on tea gardens. Here and there it is said that they will work upon the roads, others again cut cane, while north of the river, *muga* and *eri* silk is sometimes the source from which the revenue is paid.

**Social
restrictions.**

The inhabitants of Lakhimpur are not hampered by many social restrictions with regard to trade, but commerce has but little attraction for them in any of its forms. All castes may of course catch fish, but Doms alone will sell it, though in Sadiya some of the Miris are beginning to do so, to the disgust of the older members of the tribe. All over the district there is a prejudice against paying money or lending rice either on Monday or Wednesdays, and in places Saturday is barred as well. Saturdays and Tuesdays are also

thought to be inauspicious days for building houses or beginning to sow or plough. Similar objections hold good with regard to the day of the new moon, the full moon, and the eleventh day following.

At the time when we first came into possession of the Province, the difficulty of communications proved a most serious obstacle to its development. The Brahmaputra was the great highway which connected this portion of the Company's dominions with Bengal, but the journey up the river for any boat of ordinary size was a very lengthy business. McCosh, writing in 1837, stated that a large boat took from six to seven weeks to come from Calcutta to Gauhati, though the post, which was conveyed in small canoes rowed by two men, who were relieved every fifteen or twenty miles, reached Gauhati in ten days and Bishnath in three days more.* From Gauhati to Dibrugarh it was a month's journey for a "pinnacle," even in the cold weather;† and in the rains against the current the journey took much longer.

Few people presumably had sufficient time or patience to undertake the voyage at that season of the year. Week after week the weary traveller must have pursued his tedious way, his view bounded, as a rule, by high banks of treacherous sand, which then, as now, were continually being undermined by the current, and

* Topography of Assam-page 9 & 82.

† Report on the Province of Assam by A. J. Moffatt Mills, Calcutta 1854, paragraph 82. Butler in his Sketch of Assam puts the journey from Calcutta to Saikhoa in a badgerow *via* Dacca at over nine weeks even in the co'd weather.

falling with a crash into the water. It was only occasionally that he could relieve the monotony of the voyage by a stroll on shore, as through the greater part of its course down the valley, the banks of the river are covered with high reeds and grass, which are quite impenetrable to a man on foot; and the tedium of this dreary voyage of fully three months duration, must have been immense. Canoes, of course, could travel faster against the current, but a canoe is not a vessel in which the ordinary man can journey for many days in comfort.

Beginning of
steam
navigation

This was the state of things for twenty-two years after our annexation of the Valley, but in 1848, the Government steamers were deputed to ply between Calcutta and Gauhati. Three years later, the Commissioner, Major Jenkins, made the not unreasonable proposal that three or four times a year they should be allowed to proceed right up the Valley to Dibrugarh. His suggestions were negatived by the Marine Department, on the ground that the voyages would be financially a failure; but his views were strongly urged on Government by Mr. Mills when he visited the Province in 1853. The proposal met with the approval of the Lieutenant-Governor, instructions were issued for the despatch of a steamer in that year, and several voyages were made with results that were not unsatisfactory, even from the financial point of view. The journey from Gauhati to Dibrugarh and back occupied no more than fifteen days, an extraordinary contrast to the interminable delay of the same voyage in a

country boat. The cargo tendered soon exceeded the carrying capacity of the steamers; and in 1855, Lieutenant Colonel Jenkins complained that the vessels reached Gauhati fully laden with goods shipped in Upper Assam, so that Gauhati and the ports below derived practically no advantage from the downward service of the steamers.

As was only to be expected, the rates at first charged were fairly high, and a ticket from Calcutta to Gauhati cost no less than Rs. 150. On the other hand, the accommodation was designed on an extremely liberal scale, as the regulations, issued in 1851, expressly authorised passengers to carry pianos in their cabins free of freight, provided that they were required for use during the voyage and were not in packing cases; a proviso which suggests a very deliberate voyage as compared with the speedier travelling of the twentieth century. Freight on ordinary stores seem to have been charged at the rate of one rupee per cubic foot between Calcutta and Gauhati; but for some time longer a great part of the trade of the Province continued to go by country boat. The planters could never count on being able to despatch their tea by steamer, and were thus compelled to keep up an establishment of country boats, and having got the boats to use them, and the same objection held good in the case of native merchants.* The cost of working the line was heavy, but in spite of this, it showed a fair profit, and it was evident that

* Memorandum by the Director of Public Instruction, Bengal, dated the 7th February 1857.

there would be a great development of the traffic if only facilities were provided for it.

Private
Steamers,
put on the
river.

In 1860, the Indian General Steam Navigation Company entered into a contract to run a pair of vessels every six weeks, provided that the Government boats were taken from the line ; and since that date the steam navigation of the Assam Valley has been in the hands of this Company, and the River Steam Navigation Company, with whom they are associated. But in spite of the existence of a regular service, and the quickening effects of private enterprise, travelling still continued to be very slow. The steamers did not profess to run to scheduled time, the delay at the larger ports for the loading and unloading of cargo was considerable, and the passenger no doubt often required his piano to beguile the tedium of the way. In 1861, the Commissioner, Colonel Hopkinson, was disposed to take a gloomy view of the condition of affairs ; and in a letter to Government openly gave expression to the opinion that it would be better to compensate the planters for any loss they might sustain, and abandon the Province, unless Government were prepared to enter upon a course of vigorous material improvement. In the same letter, he drew the following dreary picture of the isolation of Assam.

“With the furious current of the Brahmaputra, still unconquered by steam, opposing a barrier to all access from without, and not a single road fit for wheeled carriage, or even passable at all for a great portion of the year, there is such an absence of the full tide of life running through Assam, such a want of intercourse between man and man, as does and must result in apathy, stagnation, and torpidity, and a terrible sense

of isolation, by which enterprise is chilled and capital and adventurers scared away. The profits of tea cultivation should attract hundreds where tens now come, but the capitalist is not always to be found who will venture his money in a country to which access is so difficult as it is to Assam, through which his correspondence travels at the rate of a mile and a half an hour, and in which it may take a month to accomplish a journey of two or three hundred miles; nor on the other hand, is it every spirit, however bold, that cares to encounter so dreary a banishment, and to be so entirely cut off from his fellows in a place from which exit is only possible at rare intervals, and must be so literally a prison or tomb to him."

Matters, however, gradually improved, and in 1884, ^{The daily mail service.} a daily service of mail steamers was started between Dibrugarh and Dhubri, connecting with a steamer which plied between the latter place and Jatrapur. Here the traveller who was pressed for time could take the train to Calcutta, though the line was not of the most comfortable, as more than one river had to be crossed in boats before the capital of Bengal was reached.

The introduction of a daily steamer service represented an enormous advance in the facilities for communication between Assam and the outer world. The large steamers were not uncomfortable, but progress was slow, and not only the hour, but the date on which they left any given port was far from certain. The would-be traveller could not choose his own time for starting on his journey, but had to select a date on which a steamer was expected at the nearest ghat; and even then he not unfrequently had to endure a weary period of waiting by the river bank. The daily service changed all that, and combined the advantages of regularity with a speed which, in comparison with that attained by the large

cargo boats, was most commendable. During the rains Dibrugarh was reached on the fifth day after leaving Dhubri, while the downward journey was performed in three days. The navigation of the river is not entirely free from difficulty, the companies were not incited to further efforts by competition, and some years elapsed before any attempt was made to reduce the duration of the voyage. On the completion of the Assam Bengal Railway, the companies realized that it was necessary to accelerate their timing if they were to retain their traffic; and during the rains, steamers now reach Dibrugarh on the fourth day from Dhubri, while the voyage from Dibrugarh to Goalundo only occupies three days, though in the cold weather the journey takes a day longer. A service of fast steamers also plies direct between Dibrugarh and Calcutta *via* the Sundarbans, by which goods can be sent direct without any necessity for handling, and the establishment of a feeder service up to Sadiya is at present under consideration.

**The Assam
Bengal
Railway.**

In 1903, Dibrugarh was supplied with an alternative means of communication with the outside world, by the completion of the Assam Bengal Railway. The line enters the district at mile 556, and meets the Dibrugarh Sadiya Railway at Tinsukia. Passengers can now travel by rail to Gauhati, thence by steamer to Dhubri,* and by rail to Calcutta, or through the North Cachar Hills down the Surma Valley to Chandpur, and thence *via* Goalundo to the capital of Bengal. The latter

* A railway from Golakganj a station on the Eastern Bengal State Railway, near Dhubri to Gauhati, is under construction.

journey can be completed in 57 hours, while the sea at Chittagong can be reached in less than two days ; a marvellous change from the two months of dreary tracking which were necessary only sixty years ago.

The cost of metalling is prohibitive in Lakhimpur, the unmetalled roads are quite incapable of carrying heavy traffic in the rains, and the necessity for providing an outlet for tea and for the coal in the extensive measures at Makum, led to the construction of the Dibru Sadiya Railway in 1885. This line runs from the Brahmaputra near Dibrugarh past Dibrugarh bazar, Lahool, Dikam, Chabua, Panitola, and Tinsukia Junction to Makum Junction, which is 35 mile east of Dibrugarh. Here it divides into two branches. One line turns north and runs past Barhapjan, Hansara, and Dumduma, to Talap, a distance of 16 miles, and will soon be extended to the Brahmaputra at Saikhoa. The main line runs east and then south past Tingrai, Digboi, and Powai to Margherita, 59 miles from Dibrugarh. In 1903, nearly 240,000 tons of coal were carried over this railway, and there is a large traffic in tea, oil, grain, piece goods, and similar commodities.

**The Dibru
Sadiya
Railway.**

In addition to its most convenient railway, Lakhimpur is fairly well supplied with roads. In 1902-03 there were 23 miles of metalled and 723 miles of unmetalled roads, maintained either by the Public Works Department or the Local Boards ; the last named authorities being responsible for about five-sevenths of the total length. Calculated on the total area of the district, this gives about 6 square miles of country for every

**Road
system.**

mile of road, but the advantages enjoyed by the inhabitants of Lakhimpur are greater than these figures would suggest. There are large tracts of country, more especially north of the Brahmaputra and east of the railway line, in which population is extremely sparse and roads are not required; and the part of the district which is south of the river and west of the railway, in which most of the tea gardens are situated, is well supplied with the means of communication. The roads are, as a rule, well bridged, and only the larger rivers are crossed by ferries; but though they are raised above flood level, they are much cut up if heavy traffic passes over them in the rains, as only a very short length has as yet been metalled.

Roads on
the south
bank

The south trunk road enters the district from Sibsagar, $23\frac{1}{2}$ miles west of Dibrugarh, passes through that town, runs along the Dibru Sadiya Railway line as far as Talap, and finally ends at Sadiya 66 miles from Dibrugarh. There are rest houses at Lepetkatta 9 miles, and Dihing 20 miles west of Dibrugarh, while east of that town they are situated at Tinsukia on the 30th mile, Dumduma on the 44th, Talap on the 51st, Saikhoa on the 60th, and Sadiya. From Sadiya there is a fine road running north to the frontier outpost at Bomjur 25 miles away, but it is only required for military and strategic purposes and carries little traffic.

At Lahoal, another important road takes off from the trunk road six miles east of Dibrugarh, and runs through the Madarkhat, Tengakhat and Jaipur mauzas to Jaipur, a total distance of 30 miles. There are rest

houses at Madarkhat 8 miles, and Tengakhat, 18 miles from Dibrugarh, and at Jaipur itself. The rivers are all spanned by permanent bridges, with the exception of the Dihing on the 23rd mile, which is crossed by a ferry.

North of the Dibru-Sadiya Railway, the Rangagora road runs for 26 miles east of Dibrugarh, through the Rohmorla and Bagdang mauzas to Guijan. Branch roads leave it at the 9th and the 24th mile, and connect it with the Dibru-Sadiya road; while from Guijan a road runs south and west a little to the west of Tinsukia and along the Tingrai river, a total distance of 20 miles, and joins the Jaipur road at the 16th mile. From the 26th mile on the Jaipur road, the Horubat Ali runs to Kenduguri 21 miles away, and from Kenduguri the Sologuri Ali runs due west between the Khowang and Jaipur mauzas to the Diroi river, a distance of 21 miles.

These are, however, only the main lines of communication, and they are linked up with one another, and with the various tea gardens near which they pass, by a system of branch roads. There are altogether 12 more regular roads under the management of the Local Board south of the Brahmaputra, with a total length of 55 miles, but none of them are of sufficient importance to merit separate mention. Reference must, however, be made to the Dhodar Ali, a legacy from the Ahom kings, which leaves the trunk road a little to the east of the Dhansiri in the Golaghat subdivision of Sibsagar, and after running through the south of that district, finally ends at Jaipur, only the last eight miles actually lying within the boundaries of the Lākimpur district.

**Roads on
the north
bank**

North of the Brahmaputra, the north trunk road runs from the border of Darrang through the Narayanpur, Laluk, and Nabaichoa mauzas to North Lakhimpur, a distance of 34 miles. Most of the streams are spanned by bamboo or timber bridges, but four miles west of the subdivisional head-quarters station the Ranganadi is crossed by a ferry, and so is the Dikrang 22 miles further west. There is a rest house at this place, and another one at Laluk 14 miles west of North Lakhimpur. The trunk road is now being extended from North Lakhimpur to Dibrugarh. North Lakhimpur itself is connected with the Brahmaputra at Kamalabari by a road 27 miles in length, but only the first 19 miles, *i.e.*, up to the Luhit, lie in the Lakhimpur district. The Luhit is crossed by a ferry near the point where it receives the waters of the Subansiri, and a rest house has been erected on the north bank. There is another rest house on this road, nine miles south of North Lakhimpur.

The most important roads maintained in this subdivision by the Local Board are as follows. Road from North Lakhimpur to Gogamukh 26 miles, with a rest house at Gogaldubi; road from North Lakhimpur to Dhakua-khana 23 miles with rest houses at Dhakua-khana and Bebejia; road from Dhakua-khana to Bardalani about 15 miles due north; and thence another 8 miles to Gogamukh.

Ferries.

The most important ferries are those over the Brahmaputra at Dibrugarh, over the Dihing at Khowang, over the Luhit at Garamur, and over the Dikrang. The right

of managing these ferries and levying tolls at the rates prescribed by Government is put up to auction, and in 1901, those in the sadr subdivision fetched Rs. 3,800 while those in North Lakhimpur were sold for Rs. 1,900. These ferries are generally crossed on *mars* or wooden platforms placed on two canoes arranged side by side.

Till recently, the Brahmaputra was the only means of communication between Lakhimpur and the outside world, and a large part of the trade of the district still enters it and leaves it by that route. The other rivers are not much used for the purposes of commerce, as they do not tap the most productive portions of the district, and in many cases, snags, rapids, and a strong current offer a serious obstacle to traffic. During the cold weather the mail steamers have as a rule to stop a mile or two below Dibrugarh ghat, and above that town, traffic is carried on by country boat; but vessels of four tons burthen can get as far as Sadiya, and even one day's journey further on to Digarumukh, whence they bring down limestone. The great tributaries which join the main river from the north, such as the Dihang, Dibang, Sessleri, and others, come from too wild a tract to carry trade of any great importance. A certain amount of traffic is carried on up and down the Dibru river as far as Dumduma in the rains, but is suspended in the dry season, as there is then very little water in the river. A boat of four tons burthen can go up the Buri Dihing as far as Jaipur in the cold weather, and well above Margherita in the rains. At this season of the year, small feeder steamers sometimes

Water
Communica-
tions.

come up to Jaipur, to carry away the tea manufactured on the estates which are situated in the neighbourhood. A certain amount of traffic also goes on up the Nee Dihing and Tengapani rivers. In the cold weather, a boat of four tons burthen can proceed up the former river as far as Ningru Samon's village, and in the rains can get beyond the Inner Line; but there is very little population on its banks, and consequently not much traffic. The Suhansiri is navigable by large boats, almost up to the frontier of the Province, at all seasons of the year, and small steamers ply twice a week to Badati in the cold weather, and to Bordeobam in the rains. The Ranganadi is also navigable right up to the frontier, by boats of four tons burthen, at all seasons of the year, and small steamers occasionally go up to Pohumara.

**Post and
Telegraph.**

In 1904, there were 35 post and telegraph offices open in the district. The names of these offices will be found in a statement in the appendix.

The following abstract shows what an enormous development of postal business has taken place during the last forty years.

Number of post offices in.		Number of letters and post-cards delivered in thousands omitted.			Number of Savings Banks' accounts in	Balance at the credit of depositors.
1875.	1903-04.	1861-62.	1870-71.	1903-04.	1903-04.	1903-04.
6	35	4	70	877	2,981	Rs. 478,000

The articles exported from the district are few in number, but of considerable value. They consist of tea, which, in 1903, was probably worth even at wholesale prices about £1,000,000, coal, oil, wax and candles, India rubber, cane, tea boxes, and lime. Till recently, all external trade left the district by the Brahmaputra; but a portion, at any rate, of the traffic will now no doubt be diverted to the Assam Bengal Railway, as goods can be sent direct without handling to the sea at Chittagong.

Trade.

The chief imports are rice, of which some six lakhs of maunds were brought up to the district in 1903, pulse and other food grains, cotton thread and cloth, umbrellas, opium, salt, sugar and spices, tobacco, potatoes, mustard oil, *ghi*, beer and spirits, hardware and machinery, and corrugated iron. Practically the whole of the import trade is in the hands of the Marwari merchants, locally known as Kaiyas, who have reaped a rich harvest from the flourishing gardens of the district. There is hardly a plantation without its Kaiya's shop, but these enterprising dealers are not content with the profits derived from civilization. They have established agencies on the very outskirts of the district, where they trade with the hill tribes who bring down chillies, rubber, ivory, wax, madder, and other products of the jungle, which they exchange, generally at very favourable rates, for opium and other goods procurable in their shops. The Kaiya is indeed ubiquitous in Lakhimpur. There is hardly an important village, even in the sparsely populated tracts north of the Brahma-

putra, which has not its shop; and as there is generally no competition, the trader is able to buy from the raiyats, their mustard, surplus *dhan*, or *eri* cloths at exceptionally favourable rates. In the interior of the district, their shops will sometimes be found at some distance from the roads, and boats, and to a smaller extent pack ponies, are used for the removal of the produce collected in their golas. The Kaiya's shop is, in fact, the advanced outpost of civilization, and is to be found even beyond our frontier guards. There are Kaiyas on the Patkai, Kaiyas at Ningru Samons' village on the Noa Dihing, and Kaiyas at Chowkam's village near Mishmighat on the way to the Brahmakund. Their desire for gain drives these peaceful traders, who can have nothing in them of the spirit of the pioneer, into the wildest of jungles and amongst rude and uncivilized people; but as their transactions with the hill tribes are advantageous to both parties, it is seldom that any cause of friction arises.

The principal centre of trade is Dibrugarh where, in addition to the Marwari bazar, there are two large general stores under European management, and a number of shops kept by Muhammadans, who deal in furniture, hardware, crockery, and general haberdashery.

Sadiya is an important centre for the frontier trade, and is a market for lime stone, potatoes, pulses, molasses, wax, ivory, rubber, and musk, the four last articles being brought down by the Abors and Mishmis from beyond the frontier. A very large market is held every Sunday at Dumduma, which is attended by thousands of garden

coolies and villagers. There are also bazars of some importance at Saikhoa, on the south bank of the Brahmaputra opposite to Sadiya, at North Lakhimpur, where trade is carried on with the Miris and Daflas who inhabit the outer ranges of the Himalayas, and at Margherita. At the latter place there is a certain amount of trade with the trans-Patkai tribes, who bring down amber from the Hukong valley, and here is actually to be found a Chinese shop keeper, a fact which emphasises the easterly position of Lakhimpur. Since the completion of the Assam Bengal Railway, Tinsukia has shown some indications of growing into a commercial centre, as it is situated at the junction of two railways and commands all the principal avenues of trade.

There are other villages in which there are two or three small shops which deal in salt, oil, piece-goods, grain, and very often opium, but none of these places are as yet of much importance. This is largely due to the tea industry, which has a very decentralizing effect on trade. Some of the coolies' requirements are supplied by the garden Kaiya, while paddy, poultry, vegetables, and molasses can generally be purchased at the weekly markets held in different portions of the district. The economic development of Lakhimpur is altogether opposed to the growth of towns in the interior. Its principal industry is agricultural, there are no indigenous arts or manufactures to collect the people into small centres of population, and each garden tends to form a unit by itself. Two

statements in the appendix show the names of the villages in which there are three or more permanent shops, and of the places at which markets are held. For the convenience of the coolies these markets are generally held upon a Sunday.

Towns.
Dibrugarh.

The only urban area in the district is Dibrugarh, but Dibrugarh, though not at present the largest, is probably the most prosperous little town in Assam. It is situated on the left bank of the Dibru river a little above the point at which it falls into the Brahmaputra, in 27°28' N and 94°55' E. The western end of the town consists of rows of cottages along the river's bank, inhabited by Nadiyals and other low caste people, which gradually merge into Vetch Street, the great commercial centre. Here there is a daily bazar (Digli Bazar) held near the bank of the river, in which fish, poultry, grain, vegetables, and other supplies can be obtained. There are tailors shops which turn out quantities of cheap ready made clothing, *Dacca beparis* who deal in furniture, spices, stationery, haberdashery and all the miscellaneous goods affected by their class, and the wealthy Kaiyas whose staple stock in trade is grain of all sorts, piece goods, salt, and oil. Of recent years the Dibru has been cutting into this portion of the bazar, and the Kaiyas have begun to move their houses further back towards the railway station. At the end of Vetch Street comes the European quarter. Most of the houses are situated on the red road which runs along the bank of the Dibru river, and from which, on a clear day, a beautiful view can be obtained of the lower ranges of hills and the

snows beyond. Behind this road there are open maidans, on which are situated the cutcherry and other public offices, and the recreation ground. At the back of these maidans are the Graham Bazar, the medical school, the jail, and the military police lines. The eastern end of the town is occupied by the cantonments. In addition to the buildings already mentioned, Dibrugarh contains a large masonry fort, which is now only used as an arsenal for the volunteers, a church, four small printing presses, at two of which weekly newspapers in English are published, a high school, and the workshops of the Dibru Sadiya Railway. The town has grown very rapidly of recent years. In 1872, the population was only 3,870 souls, nearly a third of whom were living in cantonments. In 1881, there were 7,153 inhabitants, in 1891, 9,876, and in 1901, 11,227.

The prosperity of the place is evinced by the fine shops erected by the richer Kaiyas, and the comfortable houses in which many of the native gentry dwell. In spite of this, Dibrugarh is one of the least picturesque of any of the towns in Assam. There are none of the low hills which add so much to the charm of Gauhati and Tezpur, none of the stately trees which convert Nowgong into a noble park. The town is well laid out, the streets are broad, there are hardly any slums, and the sanitary arrangements leave little to be desired, but apart from the view of the hills from the red road, the place is uninteresting, flat, and dull. The total area of the town including the cantonments is 2.1 square miles, and it contains altogether over 15 miles of

road, 13 of which are metalled. Drinking water is either obtained from the river or from wells, 20 of which have been sunk for the use of the general public. Dibrugarh is easy of access from the outside world. It is one of the termini of the Dibru-Sadiya Railway, and is thus connected by rail with Gauhati and with the sea at Chittagong. The trunk road from Dhubri to Sadiya runs through the town, and it is the terminus of the steamer service on the Brahmaputra.

The town was constituted a Municipality under Act V. (B. C.) of 1876 in 1878, and Act III (B. C.) of 1884 was introduced in 1887. The Municipal Committee consists of 14 members, 9 of whom are elected by the rate payers and are non-officials. The Deputy Commissioner has always hitherto been appointed Chairman, but the duties of Vice-Chairman are discharged by a private gentleman. The principal taxes imposed are a tax on holdings at the rate of 5 per cent. on the annual value, and a latrine rate. The incidence of income per head of population during the year 1903 (Rs. 3-9-9) was higher than that of any other urban area in the Province except Gauhati, Tezpur, and Shillong; but a considerable proportion of the income takes the form of a grant from Government, and the incidence of taxation per head, in 1903, was only Re. 1-5-2. In addition to the Government grant, the principal sources of income are taxes on houses and lands, animals and vehicles, the conservancy rate, and the revenue derived from the municipal market. Details with regard to the principal items of expenditure and revenue in 1890-91 and 1900-01 will be found in Table XVIII.

North Lakhimpur, the headquarters of the subdivision of that name, is little more than a village. Situated as it is on an upland plain covered with short grass, close to a range of hills nearly 10,000 feet in height, the appearance of the place is extremely picturesque. The public buildings include a small cutcherry, a school, a post and telegraph office, a dispensary, a circuit house, a dak bungalow and a small jail. A reminiscence of the former troubles on the frontier is to be found in the Government treasury, which is located in a masonry tower which was used as a fort in olden days. In the village street there are six Kaiyas shops, and some ten more kept by Muhammadans and up-country men. The Daflas and Miris bring down rubber, wax, madder, and elephants tusks, and the Assamese sell paddy, mustard, pulse, potatoes, and a small quantity of *eri* and *muga* silk cloths. The trade of the place is, however, unimportant, as the Kaiyas have many shops in the interior with which the villagers are able to deal direct.

North
Lakhimpur.

In 1872, the management of the district roads was entrusted to a committee presided over by the Deputy Commissioner. The funds at their disposal were partly obtained from tolls and ferries on local roads and other miscellaneous sources, but principally from grants made by the Bengal Government from the amalgamated district road fund. In 1874, when Assam was erected into a separate Administration, the Government of India assigned one seventeenth of the net land revenue for local purposes. The district improvement fund was then started, and the administration of its resources was

Local
Boards.

as before entrusted to the Deputy Commissioner assisted by a committee. The actual amount placed at their disposal was not large, and in 1875-76 the total income of the district funds of the Province was only Rs. 1,85,000, which was a small sum in comparison with the twelve and a half lakhs of rupees received by the Local Boards in 1903-04. In 1879, a Regulation was passed, providing for the levy of a local rate, and the appointment of a committee in each district to control the expenditure on roads, primary education, and the district post. Three years later, the district committees were abolished by executive order, and their place was taken by boards established in each subdivision, which are the local authorities in existence at the present day.

The Deputy Commissioner is Chairman of the board of the headquarters subdivision, but the board in North Lakhimpur is presided over by the subdivisional Officer. The Local Boards are entrusted with the maintenance of all roads within their jurisdiction, with the following exceptions. The trunk roads north and south of the Brahmaputra, the roads from North Lakhimpur to Kamalabari, and from Dibrugarh to Jaipur, the roads within municipal limits, and a few of purely political importance in the neighbourhood of Sadiya. They are also charged with the provision and maintenance of local staging bungalows and dispensaries, and with the supervision of village sanitation, vaccination, and the district post. They are also in charge of primary education, subject to the general control of the Education Department, and are empowered

to make grants-in-aid to schools of higher grade, subject to certain rules. For these purposes, they have placed at their disposal the rate which is levied under the Assam Local Rates Regulation of 1879, at the rate of one anna per rupee on the annual value of lands, as well as the surplus income of pounds and ferries, and some minor receipts. The receipts under the head of provincial rates are not sufficient to provide for the proper development of the district, and the local income is supplemented by large grants from Provincial funds. In the case of the North Lakhimpur Board this grant amounts to considerable more than half the total income, while in Dibrugarh it exceeds one third. The principal heads of income and expenditure are shown in Table XVII. The annual budgets of the boards are submitted to the Chief Commissioner for sanction. The estimates for all works, costing Rs. 500 or over, must be submitted to the Public Works Department for approval; and important works, requiring much professional skill, are made over for execution to that Department. Less important works are entrusted to the board overseers.

The following statement shows the constitution of the Local Boards in the district.

Name.	Area.	Population.	MEMBERS.				
			Total number.	Euro-pean.	Native.	Official.	Elected.
Dibrugarh ...	3,038	286,572	26	15	11	4	10
North Lakhimpur ...	1,174	84,824	14	8	6	2	6
Total Lakhimpur ...	4,207	371,396	40	23	17	6	16

Work done
by Local
Boards.

A glance at the Revenue survey map will show that the authorities entrusted with the construction and maintenance of the lines of communication in the district received no mean legacy from the days of native rule. The Bor Phukan Ali, the Mori Ali, the Rupgarh Ali, the Dhodar Ali, the Hapni Ali, the Solaguri Ali, are names which recall the Ahom Rajas with their legions of *paiks*, who were sometimes employed in the excavation of enormous tanks, sometimes in throwing up fine roads, raised well above the level of the surrounding country. During the last twenty years, the local authorities of Dibrugarh have not been much concerned to extend the existing mileage of their high-ways. They have, however, done good service in constructing bridges of masonry, or iron and timber over rivers which had previously to be crossed on rafts, or on temporary structures of bamboo, structures which were liable to be washed away in time of flood, or to suddenly collapse beneath some mounted traveller. Some of the most important of these bridges are those over the Tikra Disai, Dinjan, and Dholajan on the Rangagora road; over the Tingrai, Hingrijan, and Baliyan, on the Tingrai Hingrijan road; over the Kakojan and Mamochikajan on the Dhodar Ali; and over the Sesa on the Mankata road. They have also metalled short sections of these roads where the traffic is heaviest; but the enormous cost of metal-ling in Assam, and the heavy charges for repairs, has rendered it impossible hitherto to do very much in this direction. North of the Brahmaputra the country is more exposed to flood, and the roads have often to be

raised to a considerable height above the surrounding marsh. There is not as rich a legacy of public works from the days of native rule, and the local authorities have chiefly been engaged in raising and improving such lines of communication as the Badati, Dhakua-khana, and Gogamukh roads.

CHAPTER VIII.

GENERAL ADMINISTRATION.

Native system of land revenue—Early settlements—The settlement of 1893-94—Expansion of the land revenue—Poll Tax—Established and fluctuating cultivation—Annual and periodic leases—Settlement staff—Land tenures—Land revenue collection—Town Land—Area of unsettled waste—Excise—Income Tax—Stamps—Public Works—Criminal and Civil Justice—Registration—Military—Civil Police—Military Police—Jail—Education—Printing Presses—Medical—Surveys.

Land
revenue.
Native
system.

The system of taxation in force under the Ahom kings was mainly one of personal service. The whole of the adult male population was divided into bodies of three men called *gots*, each individual being styled a *paik*. One *paik* out of the three was always engaged on labour for the State, and while so employed was supported by the remaining members of his *got*. In return for his labour each *paik* was allowed 8 *bighas** of *rupit* land, and the land, occupied by his house and garden, which is now called *basti*, free of revenue. Any land taken up in excess of this amount was assessed at As. 4 a *bigha*. In addition to this the villagers paid a poll-tax of one rupee for each adult *paik*.

Early
settlements.

The earliest land revenue report of Lakhimpur available is one submitted by Major White in January 1835, though it is really a misnomer to describe it as a

One acre=3'025 *bighas*.

land revenue report of Lakhimpur, as practically the whole of the district at that time was under native rule. In Purandar Singh's territory the *paiks* paid a capitation tax of Rs. 3 a head, in return for which they were allowed to cultivate 8 *bighas* of land. The system of organized compulsory labour seems to have fallen into disuse, though probably the Raja obtained all the labour he required free of charge. In Matak the people made presents to the Bor Senapati in kind, and a certain amount of labour was at his disposal. *Paiks* migrating from the territory of Purandar Singh paid in cash instead of kind, and such migration was encouraged by the assessment of a much lower rate than that prevailing in the Raja's territory. The revenue of the Sadiya-khoa Gohain, was obtained, like that of the Matak chief, from presents and occasional forced labour. In 1853, the revenue in Upper Matak was still collected in the form of a poll-tax of Rs. 2 on every able bodied man; but the population was extremely sparse and the gross demand only amounted in the previous year to Rs. 3,012. In North Lakhimpur and in Lower Matak, the rates assessed were 3 annas a *bigha* for *rupit* (land fit for the growth of transplanted rice) and 2 annas a *bigha* for other land. In Sadiya and Saikhoa they were one anna a *bigha* higher. The land revenue assessment of the district in 1853 was less than half a lakh, and the amount realized from poll-tax was only some Rs. 5,000 more.

In 1865, the Commissioner, Lieutenant-Colonel Hopkinson, proposed to discriminate between *basti* or garden and other land, and to raise the *bigha* rates to Re. 1

Colonel
Hopkinson's
settlement.

for *basti*, 10 annas for *rupit*, and 8 annas for other land. No detailed enquires were made, there was no attempt to estimate the comparative value of the three different classes of land, there was no discrimination between good and bad land in the same class, or even between the different districts in the valley. The revised rates were, however, so moderate that it was never seriously contended that, they would have an oppressive incidence even on the worst land on which they were imposed. Colonel Hopkinson was of opinion that the existing assessment was ridiculously low, and to support his contention, pointed out that in 1864-65 the receipts from opium were about 4 lakhs of rupees more than the total land revenue of his division, an excess which in those days represented a difference of about 40 per cent. The new assessment was successfully introduced in 1868-69, and in spite of the great enhancement* the revenue was collected without difficulty.

One very effective protest was, however, entered by the raiyats, who resigned so large a proportion of their land that the revised rates, though nearly double of those previously in force, only brought out an enhancement of about 26 per cent. in the gross revenue. But the land resigned was speedily retaken, and the land revenue demand of 1871-72 was nearly double that of the year preceding the re-assessment.

The
settlement
of 1893-94.

The next settlement was made in 1893. The three-fold division of land was retained, but instead of im-

* The land revenue of Assam Proper was raised from Rs. 12,89,000 to Rs. 20,78,000.

posing the same rate on all land of the same class throughout the district, the villages were divided into four grades, and the rates assessed varied with the grade of the village.* The villages were provisionally graded by the Director of Land Records and Agriculture, the class in which each village was placed being determined by the demand for land, and not by any intrinsic considerations of the value of the produce, the fertility of the soil, or the profits of cultivation. The demand for land was estimated by ascertaining the density of the population, the proportion of settled to unsettled land, and the proportion of fluctuating cultivation. These lists were sent to local officers for examination, and were modified by them in view of the fertility of the soil, the facilities for bringing the produce to market, and the rents paid by sub-tenants where ascertainable. This enquiry was carried out by the ordinary district staff within the space of a single cold weather, and the results obtained made no pretensions to scientific accuracy. Such accuracy was considered to be unnecessary, as it was not intended to impose anything like the maximum assessment on the land. The Government had no desire to assess up to its fair share of the value of the produce of the soil, and under these circumstances it was contended that it would be

* The following were the rates imposed—

		First class.		Second class.		Third class.		Fourth class.		
		Rs.	A.	Rs.	A.	Rs.	A.	Rs.	A.	
<i>Basti</i>	...	1	6	1	4	1	2	1	0	per bigha.
<i>Rupit</i>	...	1	0	0	14	0	12	0	10	"
<i>Faringati</i>	...	0	12	0	10	0	9	0	8	"

waste of time and money to have recourse to any minute and elaborate classification of the soils, to crop experiments on a large scale, or to a close examination of all the elements that affect the net profits of the cultivator. The theory on which the settlement was based, was, that the worst lands were capable of bearing the assessment imposed, and that Government alone was a loser by its inequalities.

**Expansion of
the land
revenue.**

The following statement shows what an extraordinary development there has been both in the settled area and the land revenue demand during the past fifty years. The one has increased five fold, the other, thanks to the gradual raising of the rates, by twice as much. This enormous development is principally due to British enterprise, which has imported coolies in thousands to develop the natural resources of the district. The raiyat has had every inducement offered to him to extend his operations, and the cultivating classes have been reinforced not only by the increasing number of their own sons and daughters, but by the diligent immigrant from Bengal.

A D		Rs.		Acres.

Poll Tax.

A relic of the former revenue administration is still to be found in the poll tax of Rs. 3 per adult male, which is assessed on Miris who have settled in the plains. They

live for the most part in the *chapori* tracts, grow summer rice and mustard, and seldom plough the same field for more than two or three years in succession. They are gradually settling down to the cultivation of transplanted rice, in holdings which are kept on permanently from year to year, and, when in any village the area under permanent cultivation is sufficiently extensive to render it profitable to assess it in the ordinary way, the poll tax is abolished and land revenue substituted in its place.

The system of cultivation in the district falls into two main heads, established and fluctuating. In the established area the staple crop is *sali* or transplanted paddy, land is not readily resigned, and frequently possesses a considerable market value. In the fluctuating tracts the staple crops are mustard, pulse, and summer rice (*ahu*), and continual change is one of the essential elements of cultivation, the same field being seldom cropped for more than three years in succession. This fluctuating area is confined to high lands and to a belt on either side of the Brahmaputra, and along the banks of the larger rivers that flow from the hills through North Lakhimpur. Only about 9 per cent. of the total settled area of Lakhimpur is classed as fluctuating, a proportion which is much lower than that found in the districts of Lower and Central Assam. There is a marked difference in the distribution of this fluctuating area between the two subdivisions. In Dibrugarh the fluctuating area is less than 1½ per cent. of the total settled area. In North Lakhimpur it is nearly 39 per cent.

Established
and fluctuating
cultivation.

Annual and periodic leases.

The bulk of the land on which the staple crops of the district are grown is held direct from Government by the actual cultivators of the soil on annual or periodic lease. The periodic lease confers a right of re-settlement and a heritable and transferable title. Annual leases merely authorise the occupation of the land for a single year, though in practice the rights of transfer, inheritance, and re-settlement are recognized. The only drawback of the annual lease lies in the fact that, if the land happens to be required by Government, it can be resumed without payment of compensation to the occupant. Land held under either form of lease, or any individual field within the holding, can be resigned, on formal notice of the fact being given to the Deputy Commissioner or Subdivisional officer.

The mandal

The basis of the land revenue system is the mandal, the village accountant and surveyor who draws a modest stipend ranging from Rs. 8 to Rs. 12 per mensem. In March he inspects the fields which have been formally resigned to see whether they have been actually relinquished, tests the boundaries of fields taken up in recent years to see whether they are in accordance with the map, and surveys land which has been broken up for what is called the regular settlement, or for which a formal application has been filed. His two principal registers are the *dag-chitha*, in which particulars are entered for each field within the village, and the *jamabandhi* or rent roll, which classifies the fields by holdings, and shows the area covered by each lease. During the hot wea-

ther he is occupied with the revision of his maps and registers, and the preparation of his leases. When the winter comes, he again proceeds to the field, distributes the leases he has prepared, and surveys the land which has been broken up since his former tour, and which is included in what is known as the *dariabadi* or supplementary settlement. He is also required to prepare statistics of the area under different crops, he assists in the collection of the revenue, and is often ordered to report on local disputes connected with the land.

In most Provinces in India, a settlement is concluded for a term of years. During its currency no land which is held on lease can be resigned, and there is not as a rule any appreciable quantity of waste land to be taken up. The state of affairs in Lakhimpur is very different. In 1902-03 the total settled area was 414,228 acres, the area excluded was 14,000 acres, and the area of land newly taken up 21,885 acres. The area of land resigned is, for Assam, comparatively small. This is due to the fact that the level of the district as a whole is fairly high, and to the absence of any pressure on the soil which enables the villagers to exercise a certain amount of discrimination in their choice of land.

The area taken up and resigned in 1903-01, and subsequent years in each of the subdivisions will be found in Table XII.

Above the mandal comes the supervisor kanungo, a peripatetic officer, on pay ranging from Rs. 30 to Rs. 40, Superior
settlement,
staff.

who checks the mandal's work, both in the field and in the office. The superior revenue officers are called sub-deputy collectors, and draw salaries ranging from Rs. 100 to Rs. 200 per mensem. Appointments to this grade are usually made by selection from candidates who must be of good physique and moral character, of respectable family, under 25 years of age, and must either have taken a university degree, or have read up to that standard. The total sanctioned staff for the Lakhimpur district is two sub-deputy collectors, six supervisor kanungoes, and 113 mandals. In cadastral areas the average size of a mandal's charge is about six square miles of settled land.

**Land
tenures.**

The different tenures in the district fall under two main classes—(1) those under which land is held for the cultivation of ordinary crops and (2) those under which grants have been made for the growth of tea or other crops, which are not included amongst the ordinary staples of the Province, and which require a considerable amount of capital for their production. The bulk of the land included in the first class is settled under the ordinary rules at full rates, and the area so settled from year to year will be found in Table XV. The area of land held free of revenue (*lakhiraj*) or at half rates (*nisfi-khiraj*), is very small. These estates represent grants made by the Ahom Rajas and confirmed by the British Government. The manner in which some of them became assessed to revenue is described in the Gazetteer of the Sibsagar district. A small area of 141 acres is also held revenue free by Katakis, a class

of men who are supposed to act as the intermediaries between Government and the hill tribes.

Two sets of rules were in force for the grant of land for tea prior to 1862. The underlying principal in each case, was that the land should be held on long leases at low but progressive rates of revenue, and that precautions should be taken against land speculation by the imposition of clearance conditions. Between 1862 and 1876, the fee simple tenure of waste land grants was put up to auction at an upset price of Rs. 2-8 an acre, which in 1874 was raised to Rs. 8. The holders of grants under the earlier rules of 1838 and 1854 were also allowed to purchase a fee simple tenure by payment of twenty times the revenue then due, provided that the clearance conditions had been carried out. Advantage was very generally taken of this concession, and there is no longer in the district any land held under the rules of 1838 and 1854, while there are 117,000 acres held on fee simple tenure. The existing rules came into force in 1876. The land is sold at an upset price of Re. 1 per acre, for, though it is nominally put up to auction, there is no case on record in which more than one applicant appeared to bid. For two years the grant remains revenue free, and the rates gradually rise to 8 annas an acre in the eleventh, and one rupee in the twenty-first year. The lease runs for 30 years, and when it expires the land is liable to re-assessment. The total area settled under these rules in 1902-03 was 71,000 acres. Details by subdivisions and for later years will be found in Table XV.

Grant of
land for the
cultivation
of special
crops.

**Land
revenue
collection.**

In the early days of our administration land revenue was collected through the agency of the mauzadar. He received 10 per cent. of the collections for his trouble, and was assisted by a Kakati or village accountant, who received 5 per cent. The peons employed were remunerated by grants of land, and in Lower Matak the mauzadar received an extra 2 per cent. in land. In 1853 there were 87 mauzas, but the majority of these fiscal units were very different from the mauza of to-day. In no less than 26 the total revenue demand was less than Rs. 100, and in no single case did it amount to as much as Rs. 3,000.

**Larger
mauzas and
tahsils.**

The general tendency since that date has been to increase the size of the unit of collection. In 1867, the mauzadars, as the collecting officers were called, received 15 per cent of the revenue as commission, and were allowed half the revenue of land reclaimed during the currency of the settlement. Three years later their commission was reduced to 10 per cent. and in 1872, the further restriction was imposed that this 10 per cent could only be drawn on the first Rs. 6,000 of revenue, 5 per cent being allowed on revenue in excess of that sum. In 1883, steps were taken in Lower Assam to replace the mauzadar by a salaried officials. Mauzas were accordingly amalgamated and placed in charge of an official called a tahsildar, who was remunerated by a fixed salary, and was exempted from the responsibility imposed upon the mauzadar of paying in the revenue on the due dates, irrespective of the amounts actually collected by him. Only one tahsil was, however, opened

in Lakhimpur, *i.e.*, at Dibrugurh in 1896, and, as the results obtained were not satisfactory it was broken up into its constituent mauzas in 1904.

The revenue demand on account of the regular settlement is due in two instalments, three-fifths on January 15th and two-fifths on the 15th February, except in those villages which meet the Government demand from the sale, of mustard and pulse, when it is due in one instalment on March 15th. The demand on account of the supplementary settlement is also due in one instalment on that date. If a raiyat defaults, a notice of demand is issued calling upon him to pay up the amount due.* This usually has the desired result, but if further steps are called for the defaulters' property is attached. It is very seldom necessary to do more than this, but, as a last resort, the goods and even the lands of the defaulter can be sold. The number of cases in which an estate is put up to auction is comparatively small, and it is not unfrequently the case that, even when advertised for sale, it attracts no bid. Land is so plentiful in the Assam Valley, that in many places it has no selling value, and in the more densely settled areas, where it would fetch a considerable price, it seldom comes to the hammer. The following statement which contains the figures for 1902-03, shows the extent to which coercive processes are employed, and how seldom it is necessary to actually sell the property

**Compulsory
realization
of revenue.**

* Steps have recently been taken to empower the Deputy Commissioner to dispense with the notice of demand if he considers it desirable to do so.

of the defaulter. Imprisonment in default of payment of land revenue is not permitted by law in Assam.

	Rs.
Current land revenue demand	5,79,061
Arrears for which notice for demand issued	84,720
Amount of arrears paid on receipt of notice	47 853
Arrears for which property attached	89 740
Arrears for which sale notice issued	8 665
Arrears for which property sold	2,284

Town Land.

Special rules, it is hardly necessary to say, are in force for the settlement of town land. Dibrugarh is the only town, and it was settled for a period of 15 years in 1893. The rates assessed vary from Rs 150 an acre for first class trade sites, and Rs. 18 an acre for the best residential land, to Rs. 6 per acre for land cropped with rice. Under the rules now in force waste land taken up for the first time within town limits is to be settled ordinarily for a term of thirty years, at a fair rent not exceeding the annual letting value of the site. The lease of the land applied for may, if the Deputy Commissioner thinks fit, be put up to auction and knocked down to the highest bidder. In North Lakhimpur, which is really no more than a prosperous village, town land is assessed at Rs. 6 per acre, or double the rate ordinarily imposed on first class *rupit* land.

Area of unsettled waste.

The following abstract shows the total area of the district within the Inner Line, the settled area, and the area of reserved forests in 1902-03, and the area of waste land at the disposal of Government in that year.

	acres.
Total area of the district	2,898,540
Settled area	414,228
Area of reserved forests	217 522
Area of waste land	2,266,810

No less than 77 per cent. of the total area of the district falls in the latter category, but it must not be supposed that the whole of this area is fit for cultivation or human habitation. The figure includes the area of roads and of tracts that are permanently under water, of land which is submerged during the rainy season, and is hardly fit for permanent habitation, and of land which is too high or barren to be fit for the growth of food crops. It is useless to attempt to form any estimate of the proportion of the unsettled area in which cultivation could be carried on with profit, and it is hardly necessary to do so, as it is obvious that the district could support a much larger population than it now possesses. No less than 90 per cent. of the country north of the Brahmaputra is unsettled, Nokari being the only mauza in which any appreciable portion of the country has been taken up. In the sadr subdivision there are large areas of waste land towards the south and east, but the mauzas in the neighbourhood of Dibrugarh and the country through which the railway passes to Makum is densely peopled, and in this portion of the district comparatively little waste is still remaining. The settled and unsettled area in each mauza in 1902-03 will be found in Table XV A.

The excise revenue of Lakhimpur is very large, and from Table XIV it will be seen that, at the present day it amounts to about Rs. 7,75,000, or some two lakhs more than the total land revenue of the district. About two-thirds of the whole is obtained from opium, the consumption of this drug being larger in Lakhimpur than in any other district of the Province.

Excise.
opium.

Prior to 1860, no restriction was placed upon the cultivation of the poppy. The evil effects of unrestrained indulgence in opium were undeniable, and in that year poppy cultivation was prohibited, and the drug was issued from the treasury, the price charged being Rs. 14 a seer. This was raised to Rs. 20 in 1862, Rs. 22 in 1863, Rs. 23 in 1873, Rs. 24 in 1875, Rs. 26 in 1879, Rs. 32 in 1883, and Rs. 37 in 1890, the price at which it now stands.

While Assam was under the Bengal Government, licenses for the retail vend of opium were issued free of charge. In 1874, a fee of Rs. 12 per annum was levied on each shop, and in the following year it was raised to Rs. 18. Between 1877 and 1883 the right to sell opium in a particular mahal, or tract of country, was put up to auction, but this system was found to be unsatisfactory, and in the latter year the individual shops were sold as is done at the present day. The general result of the Government policy has been to largely reduce the facilities for obtaining the drug. In 1873-74 there were in the district 517 licensed shops. In 1902-03, though the population had in the interval increased threefold, there were only 140 shops, each of which paid on the average a license fee of over Rs. 700.

The statement in the margin shows the variations in consumption since 1873-74. In

1873-74	...	Mds.
		383
1879-80	...	329
1889-90	...	359
1899 00	...	374

spite of the fact that between the first and last years of the series the duty was raised by more than 60 per cent., there has been very little decrease in consumption. There has, of course,

been a considerable increase in the indigenous population, especially of Miris,* a tribe who are much addicted to the drug, and it has been sometimes thought that there would have been an increase in consumption had it not been for opium smuggling. Opium can be sold retail in Lakhimpur for from Rs. 1,600 to Rs. 2,000 a maund. In parts of India it can be bought for very much less than this, so that the profits of the business would be very large and the risk comparatively small. In the summer of 1898 much attention was paid to this matter by the Deputy Commissioner, and a Marwari convicted of illegal practices was imprisoned and not merely fined. In 1898-99 the issues of treasury opium increased by $45\frac{1}{2}$ maunds, and were nearly 32 maunds larger than the issues of any of the four preceding years, and it is possible, that there was some causal connection between the imprisonment and the increase in consumption. In 1901, a small preventive force consisting of one Inspector, two Sub-Inspectors, and five chaprasis was sanctioned for employment in the Province, but they did not succeed in discovering any evidence of opium smuggling on an extensive scale, and they have recently been amalgamated with the general excise establishment.

The drug is generally swallowed in the form of pills or mixed with water and drunk. Madak is made by mixing boiled opium with pieces of dried pan leaf, and stirring it over the fire. The compound is then rolled up into pills and smoked. Chandu is made out of

* Miris 1881, 11,627,—1901,24,911.

opium boiled with water till the water has all evaporated, and is smoked like madak in the form of pills. Opium is not generally smoked in Assam, and this form of taking the drug is usually considered to be more injurious than when it is simply swallowed. Further details with regard to the number of shops in each subdivision, the quantity of opium issued, and the receipts both from license fees and duty in each year will be found in Table XVI.

Country
spirit.

The following statement shows that during the last twenty years of the century there was an enormous increase in the revenue derived from country spirits.

		Number of shops.	Revenue. Rs.
1879-80	...	11	4,814
1889-90	...	22	40,056
1899-1900	...	25	157,720

This would at first suggest that consumption had very much increased, that the liquor habit had spread amongst the people, and that persons who had once been moderate drinkers had taken to drinking in excess; but this is not the case. The prevalence of drinking is best measured by the increase in the number of shops. If this test be applied, it appears that while the foreign population, a large proportion of whom are liquor drinkers, has increased four fold,* the number of shops has little more than doubled.

The revenue is raised by putting up the right to manufacture and sell liquor at a particular shop to auction.

* Foreigners 1881 40 787 1901 152,856.

If there is no competition, the vendor obtains this license cheap, and his profits are enormous. Where there are several persons anxious to embark upon the business, the price of the license is run up, and a portion of the profits of the liquor trade is diverted from the pockets of the vendor into the exchequer of the State. The publican has little opportunity of pushing the sale of his liquor, and it is doubtful whether, if the license fees were abolished or reduced, the consumption of spirit would be in any way diminished.

It cannot be denied that, in the neighbourhood of some liquor shops, drunkenness and disorderly conduct are not uncommon, and the attention of the Administration, has been more than once directed to the most effective measures for the mitigation of this evil. One of the most serious obstacles to improvement, lies in the fact that, if the supply of licensed liquor is cut off, rice beer and spirit can be readily manufactured by the people. That this is no imaginary difficulty, is shown by the fact that complaints have more than once been received of excessive drunkenness on tea gardens, which were situated far beyond the reach of any licensed liquor shop. The outstill system has admittedly many drawbacks, and will be replaced, as soon as circumstances admit of it, by a system of central distilleries. The following measures have recently been introduced, with the object of reducing as far as possible the evils attendant on the liquor trade. A special excise establishment has been entertained, the vendor is required to arrange for an abundant supply of good drinking water

near his shop, and his license can be withdrawn if he is twice convicted of allowing drunkenness and disorderly conduct near the still.

The still. Country spirit is manufactured by native methods, and generally in what is known as the open still. The apparatus employed consists of a large brass or copper retort which is placed over the fire, to the top of which is fitted the still head, a compound vessel, part of which is made of earthenware and part of brass. The wash is placed in the retort, and, as it boils, rises in the form of vapour into the still head, over the outer surface of which a stream of cold water is continually kept flowing. As the vapour cools, it is precipitated in the form of liquid, and is carried off by a bamboo tube into a vessel placed at the side. The mouth of this tube is open, and the spirit trickles from it into the vessel beneath, so that the outer air has access by this channel into the still head and retort in which the process of distillation is going on. In the closed still, the vapour passes down two tubes into two receivers where it is cooled and condenses into liquid. These tubes are so fixed to the receivers that the air cannot have access to the spirit, and, though distillation does not proceed so rapidly, the liquor produced is stronger than that obtained from the open still.

Material employed. The material employed is generally the flower of the mohwa tree (*bassia latifolia*), which contains a very large proportion of sugar, but its place is sometimes taken by molasses and rice. The following are the proportions in which these ingredients are generally

mixed—mohwa 30 seers and water 60 seers, or mohwa 25 seers, molasses 5 seers, and water 60 seers, or boiled rice 20 seers, molasses 10 seers, and water 80 seers. *Bakhar*, a substance composed of leaves, roots and spices, whose actual ingredients are not divulged by the villagers who manufacture it, is frequently added to the wash, which is put to ferment in barrels. Fermentation takes three or four days in summer and a week in the cold weather, and the wash is then considered to be ready for the still.

The process of distillation takes about three hours. A retort of 40 gallons yields two gallons of spirit in an hour and three quarters, three gallons in two hours and a quarter, and four gallons in three hours. The best and strongest spirit comes off first, and in the case of a brew of 30 seers of mohwa the first $3\frac{1}{2}$ gallons will be classed as *phul*, if they are at once drawn off from the receiver. If they are allowed to remain while two more gallons are distilled, the whole $5\frac{1}{2}$ gallons will be classed as *bangla*. The exact proportions vary, however, at the different shops, some distillers taking $4\frac{1}{4}$ gallons of *phul* or $5\frac{1}{4}$ gallons of *bangla* from 30 seers of mohwa. Occasionally only two gallons of spirit are distilled from 30 seers of mohwa, and the liquor is then called *thul*, is very strong, and is sold for one or two rupees a quart. *Thul* is also sometimes made by redistilling *bangla*. Only one kind of liquor is generally taken from each distillation, as, if the *thul* or *phul* were removed, the spirit subsequently distilled would be not only weak but impure. Strong liquor watered to reduce it to a lower

strength is not considered palatable, and it seems to be the usual practice to distil the liquor at the actual strength at which it will be sold. One disadvantage of the cheaper kind of liquor is that it will not keep, and in four or five weeks it is said to lose all its spirituous qualities. The largest and most important liquor shops are those situated at Dumduma, Margherita, Bhati Bazar in Dibrugarh, Tinsukia, Balijan siding, and Graham Bazar in Dibrugarh. Further details with regard to the annual receipts from country spirits will be found in table XVI.

Laopani.

Laopani, or rice beer, is the national drink of the unconverted tribes, and a special name, *modahi*, is applied to those who have to some extent attorned to Hinduism, but have not yet abandoned their ancestral liquor. It is also taken by some of the humble Hindu castes, and is largely used by garden coolies if facilities are not afforded to them for obtaining country spirit. The following is the usual system of manufacture followed. The rice is boiled and spread on a mat, and *bakhar* is powdered and sprinkled over it. After about twelve hours it is transferred to an earthen jar, the mouth of which is closed, and left to ferment for three or four days. Water is then added and allowed to stand for a few hours, and the beer is at last considered to be ready. The usual proportions are 5 seers of rice and 3 chattaks of *bakhar* to half a *kulsi* of water, and the liquor produced is said to be much stronger than most European beers. Liquor is often illicitly distilled from *laopani* or boiled rice, by the following simple method. An

earthen pot with a hole in the bottom is placed on the top of the vessel containing the *laopani* or rice, and the whole is set on the fire. The mouth of the upper pot is closed by a cone shaped vessel filled with cold water, and a saucer is placed at the bottom of the pot over the hole. The vapour rises into the upper of the two jars, condenses against the cold cone, with which the mouth is closed, and falls in the form of spirit on to the saucer beneath. Care must of course be taken to see that the various cracks are closed against the passage of the spirituous vapour, but this can easily be done with strips of cloth. No attempt is made to restrict the manufacture of rice beer in moderate quantities for home use, as any attempt to do so would certainly lead to corruption and oppression. In a matter of this kind the influence of the Hindu gosains, and the pressure of local village opinion has more effect than any direct action of the Government.

Ganja is usually mixed with water, kneaded till it becomes soft, cut into small strips, and smoked. Wild ganja grows very freely in Assam, but it is doubtful whether it is much used except as a medicine for cattle. It does not produce such strong effects as the ganja of Rajshahi, but the leaves are sometimes dried and mixed with milk, water, and sugar to form a beverage. The receipts from ganja amounted to Rs. 54,000 in 1904: further details as to the number of shops and the receipts in each subdivision will be found in Table XVI. Ganja is not much in favour with the Assamese, and the revenue derived under this head from the North

Ganja.

Lakhimpur subdivision, where the proportion of foreigners is comparatively small, is inconsiderable.

Income-Tax] The total receipts under the head of income-tax in 1904 amounted to Rs. 49,734, about three-fifths of which were derived from the salaries paid to the Managers of tea gardens and their staff. The receipts under the head of "Other sources of income" amounted to Rs. 12,740 paid by 316 persons, five-sixths of whom were engaged in commerce and trade. The receipts under this head would, moreover, have been higher, were it not for the fact that some of the wealthiest firms of kайyas pay income-tax in Calcutta on the profits made in Lakhimpur. The lists of assesseees are annually examined by the local revenue officials, and checked by the subordinate magistracy, before final orders are passed by the Deputy Commissioner. The district is a progressive one and the receipts under the Act rose from Rs. 22,800 in 1888 to Rs. 59,600 in 1903. The tax on salaries paid by Companies and private employers rose from Rs. 15,200 to Rs. 34,100, and on other sources of income from Rs. 4,400 to Rs. 19,800. The decrease that occurred in the following year was due to Act XI of 1903, which raised the minimum taxable income from Rs. 500 to Rs. 1,000 per annum.

Stamps. The receipts from stamps in 1904 amounted to Rs. 67,000, rather more than half of which was realized from judicial stamps. Sibsagar is the only district in the Assam Valley in which the receipts under this head are larger than in Lakhimpur.

Public Works. Public Works are in charge of an Executive or Assis-

tant Engineer, who is usually assisted by four upper and two lower subordinates. The Public Works Department are entrusted with the construction and maintenance of all the larger public buildings. The most important are the jail, the public offices, the buildings occupied by the military and the military police, schools, and post and telegraph offices at district and subdivisional headquarters, official residences for Government officers, circuit houses, dāk bungalows, and rest houses on provincial roads. Rest houses on other roads are maintained by the Local Boards. The roads maintained by the department have already been enumerated in the section dealing with Local Boards, and it has been explained that Local Board works that require professional skill or engineering knowledge are usually made over to the Executive Engineer for execution. The principal difficulties with which the department has to contend are the absence of an artisan class, and the scarcity and dearness of unskilled labour. It is to these two causes that the heavy cost of public works in Lakhimpur is largely due.

For general administrative purposes the district is **Government** divided into two subdivisions. Dibrugarh is under the immediate charge of the Deputy Commissioner, and North Lakhimpur is entrusted to an Assistant Magistrate who is almost invariably a European.

The Deputy Commissioner is allowed two subordinate Magistrates and a sub-deputy collector as his immediate assistants, and a sub-deputy collector is usually posted at North Lakhimpur.

Criminal and
Civil Justice.

Appeals lie to the Deputy Commissioner from the orders passed by Magistrates of the second or third class, and from the orders of first class Magistrates to the Judge of the Assam Valley. Appeals from the Judge lie to the High Court of Fort William at Calcutta. In 1902, there were eight Stipendiary and seven Honorary Magistrates in the district, and the former decided 1,645 and the latter 130 original criminal cases. In the course of these proceedings 3,975 witnesses were examined. Altogether there were 1,294 cases under the Penal Code returned as true, the immense majority of which were either offences against property or the human body. Of recent years the number of cases of murder and culpable homicide in Lakhimpur has been unusually large. In the ten years ending with 1899, the average was 2 per annum, and in 1897 there were 19, and in 1900, 18 cases of this the most serious of all crimes. The total number of lives sacrificed is, perhaps, not very large, but in proportion to the population of the district it is most excessive. In 1897, there was one true case of murder or culpable homicide for every 19,000 people.* In the Province of Bengal in 1901 the proportion was one for every 134,000 people. Judged by the far from satisfactory test of the value of the property reported to be stolen, Lakhimpur is well up to the provincial standard for theft and burglary, and if anything a little in advance of it. The average value of the property annually stolen during the ten years ending with 1899 was about Rs. 20,000.

* The proportion is even worse than this figure would suggest, as the population of 1897 must have been considerably lower than that of 1901 on which these figures were worked out.

The civil work is not heavy and the Deputy Commissioner acts as Sub-Judge, while two of the Assistant Magistrates, of whom the Subdivisional Officer of North Lakhimpur is one, carry on the work of munsifs in addition to their other duties. In 1902, the Sub-Judge heard 21 original cases and 23 appeals, while 1,436 original suits were disposed of by the munsifs. Almost all of these cases were simple money suits, and nearly three-fourths of them were disposed of without contest.

Special rules are in force for the administration of justice in the Sadiya frontier tract, in the north-east corner of the Dibrugarh subdivision. The jurisdiction of the High Court is barred, and the Criminal Procedure Code is not in force. Justice is ordinarily administered by the Deputy Commissioner, the Assistant Political Officer in immediate charge of the tract, and by the village elders. The Deputy Commissioner may pass sentence of death, transportation, and imprisonment not exceeding 14 years, provided that no sentence of death, transportation, or imprisonment for seven years or upwards shall be carried into effect without the sanction of the Chief Commissioner. Petty criminal cases and civil cases in which natives of the frontier are concerned, are as far as possible disposed of by the headman of the village. The general policy of Government is to abstain from interference with the local customs, to discourage litigation, and to administer cheap and speedy justice, in which equity is not obscured by the intricacies of law.

Registration The Deputy Commissioner is also District Registrar, while one of the Assistant Magistrates acts as Sub-Registrar in both the subdivisions. The number of documents registered is, however, small, and in 1903 only amounted to 583.

Military. The garrison of Lakhimpur consists of the wing of a native infantry regiment whose head-quarters are at Dibrugarh, with a detachment stationed at Sadiya. In addition to the regulars there is a strong battalion of military police, described in the following section, whose duties are of a purely military character, and the volunteers. A corps of mounted infantry was first enrolled in Lakhimpur in 1882, with a strength of 54 members. Nine years later the volunteers in the four upper districts of the valley were formed into one corps, known as the Assam Valley Mounted Rifles, and in 1896 the Mounted Rifles were converted into Light Horse. The strength of the corps in 1903 was 312, 139 of whom were residing in Lakhimpur. The great bulk of the members of this corps are planters, and they form a really fine body of men, well mounted, well equipped, and of excellent physique, who in an emergency would be of great assistance in maintaining order.

Police.
Civil police. The civil police are in charge of a District or Assistant Superintendent of Police. The sanctioned strength consists of 2 Inspectors, 18 Sub-Inspectors and 163 constables. Forty smooth-bore Martinis are allotted to Lakhimpur and a reserve of men is kept up at the district and subdivisional head-quarters, who are armed with these weapons and are employed on guard and escort duty

Up-country men, Nepalese, and members of the aboriginal tribes are usually deputed to this work, though attempts are made to put all the constables through an annual course of musketry. Table XIX shows the strength and cost of the police in 1881, 1891, and 1901.

The district is fairly free from serious crime and rural police are not employed. Such assistance as is necessary is given by the village elders or *gaoburas*. In addition to their regular duties in connection with the prevention and detection of crime, the police are required to check the returns of vital statistics, manage pounds, enquire into cases in which death has not been due to natural causes, to furnish guards and escorts, and to serve all processes in warrant cases. For police purposes the district is divided into ten investigating centres. The names of these stations with the force sanctioned for each will be found in Table XX.

Dibrugarh is the head-quarters of the Lakhimpur military police battalion which has a sanctioned strength of 7 subadars, 8 jemadars, and 832 non-commissioned officers and men, under a Commandant, who is always a military man, and generally a Captain in the Indian Army. The battalion holds a chain of outposts along the frontier, to protect the plains from the aggression of the hill men. The strength of these posts in officers and men is shewn in brackets after their names. On the north-west there is North Lakhimpur (34), then comes Sisi (14), and Dijmur, a little to the north-east of Sisi (18). The next guard is

**Military
police.**

at Mekla nearly opposite Dibrugarh (18), east of that comes Lali (20), and then Sessleri (18) near the mouth of the Dihang. Sadiya is a strong post garrisoned by two native officers and 64 non-commissioned officers and men, and north of Sadiya come Dikrang (14), Difu (18), Kerempani (25), and Bomjur, which is our furthest outpost on the north-east, (30). On the extreme east in the direction of the Brahmakund is Sanpura (18), while in the south of the district near the Naga Hills there are outposts at Lungchang (21), and Jaipur (11). Garrisons are permanently stationed at North Lakhimpur, Sadiya, and Jaipur. Elsewhere the outposts are only held for six months, as, when the rivers rise in the rainy season, the hill men are unable to descend to the plains. The stockades are surrounded by a ditch, the earth from which is thrown up to form a bank. On the top of this is a bamboo palisade, and both bank and ditch are studded with *panyis*, or pieces of sharp bamboo, which form a serious obstacle to an unshod enemy, so that against a force unprovided with fire arms these outposts would be able to make a good defence. The battalion has a good war record, and has taken part in the Aka expedition of 1883-84, the Lushai expedition of 1890-91, the Manipur expedition of 1891, the Abor expedition of 1893-94, and the Mishmi expedition of 1899-1900. The service is not unpopular and recruits are fairly easily obtained, about 78 per cent. being Gurkhas, and the remainder members of the aboriginal tribes such as Garos, Rabhas, Meches and Kacharis. The number of resignations is, however, high, as men,

when they first join, find it difficult to live upon their pay, and Assam has many attractions for the Nepalese. At Dibrugarh and North Lakhimpur the battalion supplies guards for the treasury and jail. The men are armed with Martini Henry rifles mark IV, bayonets, and kukris. Table XXI shows the name of each outpost, the distance from head-quarters, and the strength by which it is held.

The jail at Dibrugarh differs from most of those in the Province, in that the outer wall and almost all the buildings inside are composed of solid masonry. The principal sleeping wards are three in number, and there are other small detached buildings for the reception of the sick, and under trial, civil, and female prisoners. Outside the main wall there is on one side a large vegetable garden, and on the other an enclosure in which are situated the jail workshops. The following statement shows the accommodation provided for all classes of prisoners.

JAIL

Male convicts	...	...	...	108
Under-trial	...	...	...	11
Hospital	...	...	...	8
Civil prisoners	...	...	...	4
Observation cells	...	...	...	6
Females	...	...	...	21
Total				158

The convicts are usually employed on oil pressing, bamboo and cane work, tailoring, weaving, carpentry and gardening, but the receipts from manufactures are not large. Males sentenced to more than one year's imprisonment, and females with a longer sentence than a

month, are transferred to Tezpur. In North Lakhimpur there is a small subsidiary jail of the usual type. The buildings are made of thatch, timber, and bamboos, and are surrounded by a bamboo palisade. They contain accommodation for 23 convicts, who are generally employed on oil pressing or gardening. Prisoners sentenced to a longer term than three months are transferred to Dibrugarh. Table XXII shows the population of each of these jails in 1881, 1891, and 1901, the death-rate, the profits from manufactures, and the expenditure per head.

Education. The first school opened in the district was the one at Dibrugarh, which was started in 1840, and was the nucleus from which the existing flourishing high school has been developed. Prior to the opening of this institution, education was almost unknown in Lakhimpur, and it is said that it was difficult to find a man, even amongst the upper classes, who knew how to sign his name.* In 1842, a school was opened in North Lakhimpur, but even in 1853 there were only six schools in the district, with 270 pupils on their books, the remaining four being situated at Dhakuakhana, Bardalani, Saikhoa, and Tengakhat. Progress continued to be very slow, or rather there was retrogression in the place of progress, as eleven years later the number of Government schools was still unchanged, and the number of scholars had fallen to 169. There was, however, an unaided Mission School in Dibrugarh, which

* Report on the Province of Assam, by A. J. Moffatt Mills, Calcutta, 1854 Lakhimpur. Appendix D.

was well reported on, and had some 70 or 80 pupils. Between 1864 and 1874 there was an enormous development of the whole system of education. In the short space of ten years the number of schools increased nearly ten fold, and the number of scholars almost as much. The following statement shows the progress made in the three decades ending 1900-01.

Year	Number of secondary schools.	Pupils.	Number of primary schools.	Pupils.	Total Number of pupils	Percentage under instruction to those of school-going age.	
						Males.	Females
1874-75	3	271	58	1,582	1,853	...	...
1880-81	6	551	53	1,703	2,254	15.52	0.22
1890-91	7	642	97	2,351	2,993	14.04	0.69
1900-01	13	1,243	202	4,184	5,427	17.55	0.97

Secondary education has made some strides, and the number of pupils in primary schools has, no doubt, increased, but not as rapidly as might have been expected. The proportion of boys under instruction to those of school-going age was positively lower in 1891 than it had been ten years before. Though the same cannot be said of the first year of the century, the increase in the percentage was very small, and barely one out of every six potential scholars was at school. This stagnation in matters educational is no doubt partly due to the presence of a large coolie population, whose children assist their parents from an early age.

In 1901, 62 per mille of the male population were returned as literate, a proportion which was higher than that in any district in the Assam Valley except

Kamrup. A large proportion of the educated classes are, however, foreigners, and more than half the literates were literate in Bengali or other foreign languages. It is difficult to measure the growth of literacy in the district, as, prior to 1901, all persons under instruction were shown as "learning" whether they could read and write or not, while the fact that so many of the literates are foreigners serves to obscure the progress or decline of education in Lakhimpur itself. It is, however, clear that the aboriginal tribes, such as the Miris and Kacharis, and the lower Hindu castes who form the bulk of the indigenous population, are still but little impressed with the advantages of learning.

There is only one high school in the district, which is situated at Dibrugarh. The boys are taught from the earliest stage of their education up to the Entrance course as prescribed by the University of Calcutta, but many leave school without completing the course. Till recently English was taught in all the classes. The boys in the lowest class no longer learn that language, but the standard of instruction is higher than that prevailing in lower secondary (middle) schools. English is the medium of instruction in the first four classes of high schools, in the lower classes and in other schools the vernacular is employed. The course of instruction at middle English and middle vernacular schools is the same, with the exception that English is taught in the former and not in the latter. The following are the subjects taught in the middle vernacular course :—(1) Bengali or Assamese, comprising literature, grammar,

and composition, (2) History of India, (3) Geography, (4) Arithmetic, (5) Elements of Euclid (Book 1), mensuration of plane surfaces and surveying, (6) Elements of science. The Middle Schools are situated at Dibrugarh, Sadiya, Barbarua, North Lakhimpur, and Dhakuakhana.

Primary education is divided into upper and lower, but the proportion of boys in upper primary schools is less than three per cent. of the total number of boys in primary schools, and this class of school, like the middle vernacular, is slowly dying out. The course of study in lower primary schools includes reading, writing, dictation, simple arithmetic and the geography of Assam. In upper primary schools the course is somewhat more advanced, and includes part of the first book of Euclid, mensuration, and a little history. The standard of instruction given still leaves much to be desired, but efforts have been recently made to improve it, by raising the rates of pay given to the masters. Fixed pay is now awarded at average rates of Rs. 8 per mensem for certificated, and Rs. 5 per mensem for uncertificated teachers, supplemented by capitation grants at rates ranging from 3 annas to 6 annas for pupils in the three highest classes. The number of Schools of each grade, and the number of pupils reading in them will be found in Table XXIII.

The only medical school in the Province is situated at Dibrugarh. The nucleus of the fund required for its construction and maintenance was found in a legacy of Rs. 50,000, which was bequeathed for this purpose

by Dr. Berry White, a gentleman who had resided for many years in the district, and was largely interested in tea planting. The school, which is under the management of the Civil Surgeon, was opened in 1900. The course extends over a period of four years, and the pupils are taught up to the standard of a civil hospital assistant. It is largely attended, but most of the students are either Muhammadans or Bengalis, as the school has but few attractions for Assamese Hindus. There is also a survey school at Dibrugarh in which villagers receive a training which qualifies them for the post of village accountant or mandal. In addition to the village schools under Government management, boys living in the Buddhist villages are generally taught by the local priest how to read and write. The difficult Burmese character is, however, the one in which they usually receive instruction, so that they do not derive as much benefit from their labours as they might. As in the other plains districts of the Province female education has made very little progress, and the number of girls under instruction is less than one per cent. of the total number of school-going age.

**Printing
Presses.**

In 1903-04, there were four printing presses in the district, at two of which weekly papers in English were published.

Medical staff

The district contains seven dispensaries, and is in the medical charge of the Civil Surgeon who is stationed at Dibrugarh. In addition to supervising the work done at these institutions, that officer is also Superintendent of the Berry White Medical School and of the Jail,

he controls and inspects the Vaccination Department, and is required to visit and report on all tea gardens on which the death-rate for the previous year has exceeded seven per cent.

The conditions under which the people pass their days are far from conducive to a long mean duration of life. Their houses are small, dark, and ill-ventilated, and the rooms in summer must be exceedingly close and oppressive. They are built upon low mud plinths, and are in consequence extremely damp, and the inmates instead of sleeping on beds or bamboo platforms which would cost them nothing to provide, often pass the night on a mat on the cold floor. Their attire, which is suitable enough for the warm weather, offers but a poor resistance to the cold and fogs of winter, and many lives are annually lost from diseases brought on by chills, which might have been avoided by the purchase of a cheap woollen jersey. The houses are buried in groves of fruit trees and bamboos, which afford, indeed, a pleasant shade, but act as an effective barrier to the circulation of the air, and increase the humidity of the already over-humid atmosphere. Sanitary arrangements there are none; the rubbish is swept up into a corner and allowed to rot with masses of decaying vegetation, and the complete absence of latrines renders the neighbourhood of the village a most unsavoury place. The water-supply is generally bad, and is drawn either from shallow holes, from rivers, or from tanks in which the villagers wash their clothes and persons. All of these are factors which contribute to produce a high mortality,

Absence of
rural sanitation.

and there can be little doubt that, if the people could only be induced to observe even the simpler laws of health, the existing death-rate could be considerably reduced.

In comparison with Central and Lower Assam, Lakhimpur is, however, a very healthy district. The greater part of it consists of a wide plain lying south of the Brahmaputra, and for some reason or another it would seem that the south bank of the river, except in those parts where the Assam range projects into the valley, is much healthier than the country which lies to the north. The cold weather is extremely fresh and bracing, and is prolonged to a much later date than is usual in most parts of India, the rainfall is abundant, and the mean temperature of the year distinctly low.

**Vital
statistics.**

Little light is thrown upon the conditions of the district by the returns of births and deaths as they are so incomplete as to be practically useless. Vital statistics are reported by the *gaobura* or village headman to the mandal of the circle, this report being in theory submitted every second week. In practice they were received at much longer intervals, as the *gaobura* was an unpaid servant of Government, and not very amenable to discipline. It has recently been decided to allot to each *gaobura* $2\frac{2}{3}$ acres of land revenue free, and it will now be possible to enforce a stricter adherence to the rules. Between 1891 and 1901, with a rapidly growing population, the birth rate recorded on the mean population of the decade was 25 per mille, the death-rate 27 per mille, and it is obvious that both of these figures must

have been very much below the truth. In 1903, the birth-rate was 28 per mille, the death-rate 22 per mille, figures which, imperfect though they are, tend to confirm the view that the general health of the district is fairly good.

Fever and bowel complaints are the forms which death most often takes in Lakhimpur, at any rate according to the official returns. These returns are, however, so incomplete, and so little reliance can be placed on the diagnosis of the reporting agency, that the figures hardly repay examination. Most fatal illnesses are accompanied by a rise in temperature, and the villagers, in consequence, ascribe many deaths to fever, which in reality are due to some other and specific form of disease. Epidemics of cholera from time to time produce a high mortality, for, though it is apparently endemic in the district, it occasionally breaks out with quite exceptional violence.

Causes of mortality.

The abstract in the margin shows the recorded death-rate from this cause in the years when cholera was most prevalent. Small-pox also appears from time to time in a virulent form. The highest death-rates per mille recorded from this disease during recent years were 4·2 in 1896 and 2·3 in 1897. Vaccination, has, however, made considerable progress amongst the people, and small-pox is not as a rule responsible for many deaths.

Cholera.	
Death-rate	
per mile.	
1886	... 5·7
1888	... 5·6
1889	... 5·8
1895	... 5·4

The most common form of fever is a quotidian fever of malarial origin, but tertian and quartan fevers also occur. Dysentery and diarrhoea, which are generally

Other diseases.

caused by variations in the temperature and impure food and water, are responsible for many deaths. Skin diseases and worms are very common, but goitre and elephantiasis are seldom seen. Venereal diseases are common in Dibrugarh, and amongst the immigrant population, but are said to be rare amongst the Assamese. Plague made its first appearance in the Brahmaputra Valley in May 1903. The first case occurred in that portion of the Dibrugarh bazar which is inhabited by Marwari merchants, who import large quantities of grain, and it is supposed that it was through this grain that the plague bacillus was brought into the town. Altogether 37 cases with 28 deaths were reported, the last case occurring in June 1903. Since that date the disease has not made its appearance in any portion of the district. A special medical officer was appointed to have charge of the preventive operations, vigilance committees were formed in Dibrugarh, and every endeavour was made to gain the sympathy and co-operation of the people.

**Native
methods of
midwifery.**

But if the majority of people leave the world without the assistance of a doctor, the same must be said of the way in which they make their entry into it, and it is to be feared that owing to the absence of properly qualified assistance, there is considerable preventible mortality alike amongst mothers and infants. There are very few professional midwives amongst the Assamese, and a woman in her confinement is generally attended by her relatives or friends. In difficult cases they can render little help, and recourse is had to

Heaven for assistance. A goat or duck is sacrificed, and *mantras* are tied round the neck and arm of the woman, or inscribed on a brass vessel which is placed where her eyes can fall upon it. In cases of false presentation attempts are made to drag the child out by anything that offers, and the abdomen is kneaded in the hope that the foetus may be expelled. In the absence of medical aid, and this aid is seldom to be obtained, the mother in such cases generally dies. The confinement sometimes takes place in a small hut which has been specially constructed for the purpose, and the patient's bed generally consists of an old mat laid on the floor. The unfortunate mother receives practically no assistance; if the labour is a natural one all is well, but if complications arise, the case has usually a fatal termination. Many lives are also lost owing to a disregard of the rules of cleanliness which are of such paramount importance in these cases. The nucleus of a professional midwife class is, however, to be found in the *bejinis* or female doctors, women who receive a small remuneration for attending cases and practise beyond the limits of their own villages.

Though there can be little doubt that many lives are annually lost which could be saved by proper treatment, it is satisfactory to know that of recent years there has been a great increase in the facilities for obtaining medical aid, and in the extent to which the people avail themselves of the advantages now offered to them. From the following abstract it appears that for every patient treated in 1881, there were 17 in 1901, while the

Increase in
facilities for
obtaining
medical aid.

number of operations performed rose from 106 to 865.

				Dispensaries	Patients
				No.	treated.
					No.
1881	...	...	...	8	2,990
1894	...	...	...	2	10,834
1901	...	...	...	6	52,196

In 1904 it was decided to open five new dispensaries in the district.

The principal dispensaries are those situated at Dibrugarh and North Lakimpur, which had a daily average attendance in 1903 of 173, and 38, respectively. The Dibrugarh hospital is a large and very popular institution, containing no less than 98 beds, which in 1908 had a daily average of 68 in-patients. The diseases for which treatment is most commonly applied are malarial fevers, dysentery and diarrhœa, worms, skin diseases, and rheumatic affections. The number of patients treated at each dispensary in 1900 and the succeeding years will be found in Table XXVI. In considering these figures, it must be borne in mind that over a third of the total population of the district are living on the tea gardens. On every garden there is a hospital and dispensary, a liberal store of medicines and medical comforts, and a native doctor who works under the supervision of a European medical man, so that the number of patients treated in the Government dispensaries are only drawn from two-thirds of the total population.

Surveys.

A revenue survey on the scale of one inch to the mile was carried out in the district between 1866 and 1873. In 1884 a topographical map on the scales of four

miles to the inch was published, and it was revised and brought up to date in 1896. Between 1st October 1891 and 30th September 1892 the professional party carried out a cadastral survey on the scale of 16 inches to the mile, but their operations only covered some 270 square miles, and since their departure there has been a large extension of cultivation. A further area of 64 square miles has in consequence been surveyed by local agency, but in spite of this a very large area still remained unmapped in 1904.

PREFACE.

The Gazetteer of the Naga Hills district should only be regarded as a supplement to the monographs on the various Naga tribes, which are now under preparation by Mr. A. W. Davis, C.S. Similarly, much interesting information, which might under other circumstances have suitably been incorporated in this work, will be published separately in various monographs on the Manipuris and the hill tribes subject to them, which are now engaging the attention of Mr. Hodson. It will be observed that there is no directory appended to this Gazetteer. Apart from the headquarters stations there are, however, no towns or places of sufficient size or importance to demand a separate description. I am indebted to Lieutenant-Colonel Maxwell, C.S.I., for his kindness in examining the Gazetteer of Manipur, and to Mr. Davis and Mr. Reid for criticising the Gazetteer of the Naga Hills.

SHILLONG :

B. C. ALLEN.

29th May, 1905.

CONTENTS.

CHAPTER I.

PHYSICAL FEATURES.

Area and boundaries—Mountain system—River system—Geology—Climate and rainfall—Fauna. Pages 1—8.

CHAPTER II.

HISTORY.

Summary—Captain Jenkin's march—Expeditions by Mr. Grange, Lieutenant Bigge, and Captain Eld—Sixth and seventh expeditions—Lieutenant Vincent's expedition—Tenth expedition—Abandonment of the policy of non-interference—Colonel Hopkinson's policy—Lieutenant Gregory at Samaguting—Captain Butler's administration in 1876—Occupation of Kohima in 1878—Mr. Damant's murder in 1879—Siege of Kohima—Punitive measures in 1880—Pacification of district—Burning of Ratami—Punishment of Mozungzami—Burning of Yampong—Incorporation of the area of political control. Pages 9—28.

CHAPTER III.

POPULATION.

Area and density—Towns and villages—Growth of the population—Immigration—Sex and civil condition—Infirmities—Religions—Occupations. Pages 29—41.

CHAPTER IV.

AGRICULTURE AND FORESTS.

Jhum cultivation—The terraced cultivation of the Angamis—Agricultural implements—Live stock—Forests. Pages 42—48.

CHAPTER V.

INDUSTRIES—ECONOMIC CONDITION OF THE PEOPLE—COMMUNICATIONS
AND TRADE.

Arts and industries—Weaving—Iron-work and pottery—Mats—Salt
and silk—Rents—Wages—Prices—Food—Dress—Houses—Economic
condition of the people—Cart road—Bridle paths—Post and Tele-
graph—Trade. Pages 49—60.

CHAPTER VI.

ADMINISTRATION.

Revenue—Excise—Public works—Government—Criminal and civil
justice—The Garrison—Civil Police—Jail—Education—Medical.
Pages 61—70.

CHAPTER I.

PHYSICAL FEATURES.

Area and Boundaries—Mountain system—River system—Geology—
Climate and Rainfall—Fauna.

THE district of the Naga Hills lies between 25°2' and 26°47' N. and 98°17' and 94°52' E. and covers an area of 8,647 square miles. On the north it is bounded by Sibsagar; on the west by Sibsagar, Nowgong, and the North Cachar Hills; on the south by the native state of Manipur; and on the east by mountain ranges inhabited by independent Naga tribes.

The district consists of a narrow strip of hilly country, and has a maximum length as the crow flies of 188 miles, and an average breadth of about 25 miles. The Barail enters it at the south-west corner and runs in a north-easterly direction almost up to Kohima. As far as Berrima there are three main ranges of hills lying parallel to one another, the most northerly of the three being the largest and the most important, and containing several peaks over 6,000 feet in height. To one approaching the district from the

north, this range stands up like a great wall. For, though there are from ten to twelve miles of hilly- country between its lower slopes and the flat valley of the Dhansiri, these outer hills are, for the most part, only from 1,500 to 2,000 feet in height. Near Kohima the Barail is merged in the mountain ranges which have been prolonged through Manipur from the Yoma of Arakan, and the main range assumes a much more northerly direction. This range is considerably higher than the Barail. Overhanging Mao Thana, on the southern frontier of the district, there is a mountain whose summit is 9,808 feet above the level of the sea, and a few miles further north stands Japvo (9,890 feet), the highest point in the British Province of Assam.* These are, however, only the highest points in a chain most of whose peaks between Mao Thana and Kohima are considerably more than 7,000 feet above sea level.

North of Kohima, the main range gradually declines in height. Merama peak is only 4,900 feet above the sea, and Nidzukru and Thevokeji a little above 5,700 feet, but Thebzothu or Wokha Hill is 6,600 feet in height. A little to the north of Wokha the range is pierced by the valley of the Doiang, which here makes a sudden bend and runs south-west to Lungkung. From Lungkung a chain of hills runs north-east till it is stopped by the Jhanzi, almost on the northern border of the district. This range is an unusually straight and level one, most of the hills being between 2,000 or 3,000 feet in

* The Daphabum on the eastern frontier of Lakhimpur is 15,000 feet above mean sea level, but it lies outside the Inner Line.

height, but at Munching it rises to 4,234 feet. An outer range runs parallel to it on the west, which has a general height of between 1,500 or 2,500 feet, and a third range lies between the two northern sections of these chains of hills. The Japvo range throws out numerous spurs towards the east and west, and the same phenomenon is to be observed in the hills which traverse the Mokokchung subdivision north of the Doiang. The general north-eastern tendency is still discernible, but the country, as a whole, consists of a tumbled mass of hills, most of which are between three and four thousand feet in height.

In their natural state these hills are covered with dense evergreen forest. Most of the easier slopes, up to a height of about 5,000 feet, have, however, at one time or another, been cleared for cultivation. Where this has been done they are covered for the most part with scrub, bamboo, and grass, and the larger forest trees have disappeared. In the country inhabited by the Angamis the hill sides have been cut out into terraced rice fields and there is comparatively little jungle to be seen. Nowhere, in fact, is there much timber still remaining except in the bottom of the river valleys and on the summits of the hills. The slopes of Japvo are covered with primeval forest, huge trees tower into the air, and there is comparatively little undergrowth beneath their over-shadowing limbs. Near the summit, the forest is almost entirely composed of rhododendrons, whose trunks and boughs are buried in thick moss and lichen. The actual peak is a mass of tumbled rocks, which, towards the south, fall away in a sheer precipice

General
appearance
of district.

over a thousand feet in depth. Some of the higher hills near Japvo have steep grassy slopes, studded with rocks and boulders, and are almost entirely destitute of tree growth; a characteristic which is still more strongly marked in the portion of the range that lies beyond the frontier of Manipur. In the neighbourhood of Kohima the valleys are broad, the slopes of the hills are fairly easy, and have, to a great extent, been brought under cultivation, and the scenery is, for a hill district, unusually tame. The lower hills are not so healthy and are in consequence but sparsely peopled. The outer ranges on the north are for the most part covered with heavy jungle, and the intervening valleys afford a home for elephants and other varieties of big game.

**River
System.**

The Barail and the Japvo range of mountains form the watershed of the district, and, as they are seldom more than ten or fifteen miles from the western boundary, none of the rivers that come tumbling down their slopes have time to attain to any considerable dimensions before they enter Sibsagar or Nowgong. Almost as far north as Mokokchung, the whole of the drainage of the north-western face of the hills ultimately finds its way into the Dhansiri. The Dhansiri itself rises in the south-west corner of the Naga Hills, below the Laishiang peak, and flows a north-westerly course for about fifteen miles. It then turns at right angles to the north-east, and as far as Dimapur forms the northern boundary of the district. As it flows along a few miles from the outer range of hills it receives a large number of tributaries. But, with the exception of the Diphupani, they are all of them small and unimportant,

and even the Diphupani is barely thirty miles in length.

The next river worthy of mention is the Rengmapani which falls into the Doiang; but the Zubza, as the Rengmapani is called when flowing through the hills, is, after all, a very inconsiderable stream. The only river of any importance in the district is the Doiang. It rises near Mao-Thana and flows a north-north-easterly course for five and forty miles, when it suddenly turns to the north-west, and pierces the main chain of hills. After flowing for twelve miles in this direction it again turns at right angles and flows for twenty miles to the south-west. Here it turns sharp again to the north-west, and, shortly after emerging from the hills, it is joined by its largest tributary, the Rengmapani. The Doiang receives all the drainage of the main range between the Rengmapani and Wokha, while its tributary the Bagti, a stream about twenty-five miles in length, drains the valley between the inner and outer range of hills between Bhandari and Sonigao. The Doiang is only navigable for a few miles within the hills, as the channel is blocked with rocks at Nabha. If these were blasted, canoes could probably go as far as the Mokokchung Wokha road.

North of the Doiang, the principal streams are the Disai and the Jhanzi, which ultimately fall into the Brahmaputra, after flowing through the Sibsagar district. The northern frontier of the Naga Hills is marked by the Dikho, which is navigable for a short distance within the hills, though the head hunting proclivities of the tribes living on the further bank might render the voyage rather a risky undertaking. The principal river in

the territory which has recently been annexed is the Tizu, with its tributary the Lanier, which falls into the Chindwin. With the exception of the Doiang all of these rivers are mere mountain streams, which make their way towards the plains by fairly easy gradients. There are no waterfalls of any importance on any of these rivers, and there are no lakes or *jhils* within the boundaries of the district.

Geology. Generally speaking the Naga Hills are said to be composed of pretertiary rocks overlaid by tertiary strata. Oldham in 1883 described the hills, for about 20 miles north of Mao and east of Kohima, as axial, while to the west of Kohima lay a tract of tertiary country, with dun or gravel deposits immediately to the south and east of Nichuguard.* The hillsides are formed of a treacherous grey shale, which is very liable to slip after heavy rain, and which forms a stiff hard clay when cut out into the terraces on which rice is grown. There are deposits of limestone rock imbedded in the shale, ranging in colour from a light gray to a deep blue, which make an excellent building stone. A certain quantity of tufa lime has recently been discovered in the valley of the Sijju east of Kohima, and there are strings and nests of lignite in the hills near Nichuguard. Coal is also found in the hills through which the Disai debouches on the plains, and near the village of Anakey in the Mokokchung subdivision. But the most important coal fields in the Naga Hills lie outside the borders of the district, and have in consequence

* Memoirs of the Geological Survey of India, Vol. XIX, Pt. 4.

been described in the Gazetteers of Sibsagar and Lakhimpur.

During the winter time the climate of the higher hills is cold and bracing. The days are generally bright and sunny, but frost at night is by no means uncommon. At the hottest season of the year the thermometer seldom rises above 80° Fahrenheit in a well-built bungalow at Kohima, but, as the air is surcharged with moisture, the climate is sometimes found a little enervating. The low ranges of hills that adjoin the plains are far from healthy, and Nagas who settle there suffer much from fever, and generally deteriorate in physique. The average rainfall at Kohima is only 76½ inches in the year. It is considerably lower than that recorded further east, Wokha returning over, and Mokokchung nearly, one hundred inches. Kohima is, however, sheltered to some extent by the high range of Japvo.

Climate and
Rainfall.

Nearly four-fifths of the total rainfall at Kohima is precipitated during the four months June to September, and the fall in April and May is unusually low for Assam. The monthly rainfall at Kohima, Wokha, and Mokokchung will be found in Table I. Strong winds blow from the north-west in February and March, but destructive gales or tornadoes are not common.

There is very little game in the Angami country, but wild animals are still to be found in the hot unhealthy valleys, lying between the outer ranges of hills. The list includes elephants, bison (*bos gaurus*), buffalo, tigers, leopards, bears, the sambur (*cervus unicolor*, and the barking deer (*cervulus muntjac*). The serow is occasionally found on the higher mountains, and

Fauna.

the flying lemur (*galeopithecus volans*) is sometimes met with in the woods. Game birds include wild fowl (*gallus ferrugineus*), partridges, pheasants, including the horned variety (*tragopan blythii*), and woodcock. The wood duck (*asarcorius sentutatus*) is also occasionally seen. Elephants are fairly common in the western part of the district, and in 1908-04, 18 animals were captured by a gentleman who had been allowed to hunt this tract. A small herd also makes its home in an elevated valley near the village of Khonoma. The scarcity of game is illustrated by the fact that in 1908 only one person was killed by a wild animal in the Naga Hills, and rewards were only paid for the destruction of 4 tigers, 14 leopards, and 1 bear.

CHAPTER II.

HISTORY.

Summary—Captain Jenkin's March—Expeditions by Mr. Grange, Lieutenant Bigge and Captain Eld—Sixth and Seventh Expeditions—Lieutenant Vincent's Expedition—Tenth Expedition—Abandonment of the Policy of non-interference—Colonel Hopkinson's Policy—Lieutenant Gregory at Samaguting—Captain Butler's administration in 1876—Occupation of Kohima in 1878—Mr. Damant's murder in 1879—Siege of Kohima—Punitive measures in 1880—Pacification of district—Burning of Ratami—Punishment of Mozungzami—Burning of Yampong—Incorporation of the area of Political control.

BROADLY speaking, the history of our relations with **summary.** the Nagas may be divided into the following four periods—the period of control from without, by a system of expeditions or promenades; the period of control from within; the period of absolute non-interference; and the second period of control from within, merging into gradual absorption into British territory. It should first be premised that for the annexation of their territory the Nagas are themselves responsible. The cost of the administration of the district is out of all proportion to the revenue that is obtained, and we only occupied the hills after a bitter experience extending over many years, which clearly showed that annexation

was the only way of preventing raids upon our villages. Had the Angami Nagas consented to respect our frontiers, they might have remained as independent as the tribes inhabiting the hills to the south of Sibsagar and Lakhimpur; but it was impossible for any civilized power to acquiesce in the perpetual harrying of its border folk.

The first period of the history of our relations with the Nagas dates from 1889 to 1846. During this time Government attempted to control the tribes by sending expeditions into the hills; but the desired result was not obtained, and raids continued to be made into British territory. From 1847 to 1850, the experiment was tried of establishing outposts in the Naga Hills. Samaguting was the first place selected, and later on Lieutenant Vincent held a stockade at Mozema, and, for a short time, at Khonoma itself. In 1851, Government withdrew from the hills, and for the next ten years the policy of non-interference was given a fair trial, with results that were very much the reverse of satisfactory. In 1866, the post at Samaguting was re-established, and in 1878, the Deputy Commissioner took up his quarters in the heart of the Angami Naga country at Kohima. Mr. Damant was the last Deputy Commissioner to come to a violent end, and, since his death in 1879, the history of the district has been the history of the gradual extension and consolidation of our rule.

Captain
Jenkins
marches
through the
Naga Hills.

The history of what is now the district of the Naga Hills down to the year 1882 is told in the North-East Frontier of Bengal, by Mr. (afterwards Sir Alexander) Mackenzie, and need only be briefly summarised

below. The Angami country was first entered by a European in 1882, when Captain Jenkins and Captain Pemberton marched from Manipur, *via* Popolongmai and Samaguting, to Mohandiju on the Jamuna river. They were accompanied by an escort of 700 Manipuri sepoys, and during the whole of their march met with continuous and stubborn opposition. In the following year Gambhir Singh, Raja of Manipur, accompanied by Lieutenant Gordon, marched through the hills by a route a little to the east of the one followed by his two predecessors. The Nagas were at this time in the habit of raiding upon our villages in North Cachar, and the Raja of Manipur and Tula Ram Senapati,* were called upon to keep them under proper control, a request with which neither of them were in any way able to comply. This requisition was accordingly withdrawn in 1887, and it was decided to bring some pressure to bear upon the Naga tribes, through the intervention of a British officer.

In January 1889, Mr. Grange, Sub-Assistant to the Commissioner at Nowgong, was deputed to lead the first expedition into the Angami country. His transport arrangements were, however, so inadequate, that he found himself powerless to take any definite action, and his expedition degenerated into a somewhat hurried march through a part only of the Naga Hills. Twelve months later Mr. Grange led a second expedition into the hills. He marched *via* Samaguting and Khonoma to Tokquama village, two marches further on towards

First two expeditions led by Mr. Grange in 1889 and 1890.

* Tula Ram Senapati was an adventurer who succeeded in making himself master of a small portion of the North Cachar Hills and the upper valley of the Kapili. His history will be found in the Gazetteer of the Cachar district.

Manipur. He met with a good deal of opposition, which he succeeded in overcoming by vigorous and at the same time cautious action, and in the course of his operations burnt down five villages which opposed him and took eleven prisoners.* The effects of these strong measures seems to have been satisfactory, and there were no Naga raids in 1840.

Third and
Fourth ex-
peditions
under Lieu-
tenant
Bigge.

Between November 1840, and January 1842, Lieutenant Bigge, the successor of Mr. Grange, conducted two expeditions into Naga land, in the course of which he met with fairly friendly treatment from the hill men. During the second of these excursions a boundary line was laid down between Manipur and the Angami Naga territory.

Fifth expe-
dition un-
der Cap-
tain Eld in
1844.

In 1843 no British officer entered the hills, but the Nagas were more enterprising and raided the plains and killed four persons. In the following year they marched into the Rengma Hills and killed nine people, and murdered three of our Shan sepoy in the North Cachar Hills. To avenge this outrage, Captain Eld entered the hills in December 1844, and burnt several of the guilty villages, including a part of the powerful village of Khonoma.

Sixth and
Seventh
expeditions.
Bhogchand
posted at
Samaguting.

In the following year Captain Butler, who had succeeded Captain Eld as Principal Assistant Commissioner at Nowgong, made a peaceful tour through the hills; but, though he met with a friendly reception, the

* An account of this and subsequent expeditions down to 1851 will be found in Butler's *Travels and Adventures in Assam*.—London: Smith Elder & Co., 1855.

Nagas did not discontinue their depredations on the plains. In 1846-47, another expedition was sent into the hills, and it was decided to see whether the establishment of an outpost amongst the Naga villages might not deter these pertinacious savages from raiding on the plains. Samaguting was the place selected, and the post was entrusted to Bhogchand Daroga, a resolute and determined man, who had attracted the attention of the Administration by the courageous way in which he had extricated his small escort of the sepoys, when attacked by a greatly superior force of the Nagas. Unfortunately, Bhogchand had the faults which are often found in resolute and courageous men, and endeavoured to press on too far and fast. In 1849, he visited Mozema, to enquire into a dispute which was in progress between Nilholi and Jubili, two leading men in that village. Bhogchand, though only attended by a small and far from reliable escort, had, as Sir Alexander Mackenzie says, a firm belief in the prestige of a British constable, and conducted the whole of his proceedings exactly as he would have done in the case of a riot in the plains. One of Jubili's followers had been murdered by Nilholi's men, and Bhogchand proceeded to arrest the culprits. He then, in a spirit of severe impartiality, seized seven Kacharis who belonged to Jubili's party, and proceeded to remove his prisoners to Samaguting. Conduct of this kind was not calculated to please either side, and, though for a time it had the effect of putting an end to the feud with which the village had been torn, the result was hardly what had been intended or anticipated by Bhogchand. The two disputing chiefs combined to attack

their mutual enemy at Préphemah.* His guard was guilty of disgraceful cowardice, and Bhogchand and thirteen of the sepoys and coolies were killed.

Expedition
led by Lieu-
tenant Vin-
cent, 1849.

It was impossible to overlook or condone the murder of our local representative, and in December 1849, an expedition was despatched under Lieutenant Vincent to avenge the Daroga's death. The troops occupied Mozema, and Nilholi and his clan retired further back into the hills. But, while Lieutenant Campbell, who was in charge of the detachment, was visiting the neighbouring village of Jotsoma, the enemy burnt down Mozema and destroyed his stores. The expedition had accordingly to return, but in March 1850, Lieutenant Vincent re-entered the hills and took up his quarters at Mozema, where he remained during the rains. He burnt the village of Jakhama, and established an outpost of forty-six men at Khonoma; but, as two sepoys were killed close by the stockade, he decided in August to concentrate his whole force at Mozema, after burning down a portion of the Khonoma village. So little reliance could be placed upon the Nagas near Khonoma that he found it necessary to prohibit the sepoys from leaving the stockade even to draw water, except in parties of twenty men under a non-commissioned officer with at least ten muskets.

Tenth expe-
dition in
1850.

Lieutenant Vincent's position at Mozema was far from satisfactory, and in December 1850, the tenth expedition was sent into the hills. A detachment of

* Butler (p. 178) makes no mention of Jubili having joined in the attack. His clan is said to have opposed Nilholi on his return to Mozema, and they protected three men who had been left behind in Mozema by the Daroga.

384 men of all arms, equipped with two three-pounder guns and two four-inch mortars, was despatched against the fort at Khonoma. So strong, however, were the defences that, though the guns were finally brought within 75 yards, they did no appreciable damage, and an attempt to escalate the fort was foiled by a deep trench. The force accordingly bivouacked before the village for the night, and in the morning found that the place had been abandoned. The troops then made a demonstration through the hills, and several villages which opposed their progress or declined to furnish them with supplies were burnt. One village, Kekrima, sent in two heralds to our camp and solemnly challenged us to a trial of strength. The Manipuris, so they said, were afraid to meet them, and they doubted whether the British were of a different temper. It would have been fatal to our slowly-developing prestige to decline this challenge, and a move was accordingly made against the village. Kekrima was said to contain 1,000 houses and was proportionately dreaded, but the British force consisted of 150 sepoy with two three-pounders and a mortar, and about 800 friendly Nagas armed with spears. The downfall of the challengers was complete. They left at least 100 warriors dead upon the field, while our loss in killed was only two Nagas and one camp-follower.

The troops were then withdrawn from the hills, and it was determined for the future to abstain from all interference with the Nagas. The policy that it was decided to pursue was laid down in a minute by the Governor-General, the purport of which is summarised

Policy of
non-inter-
vention.

in the following paragraph: "Hereafter," wrote Lord Dalhousie, "we should confine ourselves to our own ground; protect it as it can and must be protected; not meddle in the feuds or fights of these savages; encourage trade with them as long they are peaceful towards us; and rigidly exclude them from all communication either to sell what they have got, or to buy what they want if they should become turbulent or troublesome."

It was, however, one thing to say that we would have no dealings with the Nagas, another to prevent the Nagas from having any dealings with our people. The protection of that long line of jungle-covered frontier proved to be impossible. In 1851, after the policy of non-intervention had been definitely adopted, no less than 22 Naga raids occurred, in which 55 persons were killed, 10 wounded, and 113 taken captive. It is true that only three of these raids were positively traced to Angamis, but most of them were committed in North Cachar, and there were serious grounds for suspecting this particular section of the Naga tribes.

The policy of non-interference was given a fair trial, but it was impossible to resist the conclusion that it was unsuccessful. The local officers were repeatedly urging upon Government the necessity of taking a more vigorous line, and, in 1862, the Commissioner of Assam brought the matter prominently before the Lieutenant-Governor. It was not creditable, he said, to our Government that such atrocities should recur annually with unvarying certainty, and that we should be powerless alike to protect our subjects or to punish the aggressors. It was quite certain that our relations with the Nagas could not

be on a worse footing. The non-interference policy was excellent in theory, but Government would probably be inclined to think that it must be abandoned.

Sir Cecil Beadon concurred generally in these views, and directed that an officer stationed at Nowgong should be placed in immediate communication with the Nagas, that the chiefs on the border should be informed that Government held them responsible for the good conduct of their villages, and that annual stipends would be paid to them for this police duty, as long as they performed it well. In practice, however, little effect seems to have been given to these orders, and further raids in March and April 1866 again brought the Naga question into notice. The Lieutenant-Governor declined to fall back before these wild tribes, and to recede from their neighbourhood, whenever they happened to annoy us. This proposal had been made by officers in charge of the North Cachar Hills, in despair of ever being able to protect their frontier without the more vigorous action, from which, under the orders of Government, they were debarred. Sir Cecil Beadon pointed out that, were this policy generally adopted, Assam would soon be divided amongst the Bhutias, Abors, Nagas, Garos, Mishmis and other wild tribes with which it was surrounded, and which would quickly take advantage of any signs of weakness in the central Government.

Decision to
abandon the
policy of
non-inter-
ference, in
1866.

Colonel Hopkinson, the Commissioner, proceeded to review the existing position with regard to North Cachar and the Nagas, and his opinions are thus summarised by Sir Alexander Mackenzie:—

Col. Hopkin-
son's policy

"He was not himself averse from taking a more direct control of the country. He, however, pointed out that the democratic nature of the tribal arrangements among the Angamis, the infinite divisions and disputes existing even in a single village, rendered it impossible to hope for success from the policy of conciliation *ab extra* proposed by the Government. He admitted that no system of frontier military defence that could be devised would secure perfect immunity from raids. A country void of roads, void of supplies,—a country of interminable hills, of vast swamps covered with dense forest, save where here and there a speck in the ocean of wilderness reveals a miserable Mikir or Kachari clearance, could not possibly be defended at every point against a foe for whom hill and swamp and forest are resources rather than obstacles. From 1854 to 1865, there had been nineteen Angami raids, in which 232 British subjects had been killed, wounded, or carried off. Ninety-two of these unfortunates had been so lost during the three years (1854-56), when a chain of outposts was in existence from Barpathar to Assaloo, connected by roads which were regularly patrolled. 'At most we should be able to keep the raids of such savages below a certain maximum, and prevent their extension to settled districts.' The settlement of a trade blockade, the Commissioner maintained, was advantageous when it could be made practically complete, and so far as it was complete; but none of these schemes would secure the peace of the frontier. They had all been tried and found wanting. If Government were prepared to consider a more advanced policy he was ready to show how it could best be carried out. He would depute a specially-qualified officer to proceed with a force of not less than 200 men, and effect a permanent lodgment in the country at a point most convenient for keeping open communications and procuring supplies. This officer would then invite the chiefs to submit themselves to us. Those who agreed would, as a token of submission, pay an annual tribute, and in return receive our aid and protection; while those who refused would be told that we would leave them to themselves so long as they kept the peace towards us and those who submitted themselves to us."

Lieut. Gregory estab-
lished at
Samaguting in 1866.

The Government of India then sanctioned the establishment of a strong post under Lieutenant Gregory at Samaguting. He was allowed a force of 150 police, all hill-men and well-armed, and was informed that his principal duty was the protection of the plains from the

incursions of the Nagas. A good deal was of necessity left to his discretion, but he was ordered not to exert himself to extend our rule into the interior. In January 1866, the Nagas of Razepeema cut up a Mikir village in North Cachar. In March, Lieutenant Gregory visited Razepeema and burnt it, but three months later the hill-men retaliated by killing twenty-six Mikirs in the village of Sergamcha. In the following cold weather Lieutenant Gregory visited Razepeema, burnt the village, prohibited the people from re-occupying their old lands and fields, and distributed them amongst other communities.

The establishment of an officer in the Naga Hills had, for a time, the effect of stopping raids upon British territory, but trouble was now experienced from the side of Manipur. The area of hill country over which this State had any right to exercise jurisdiction was vague and ill-defined, and this resulted in friction with the larger and more powerful villages. The boundary line between Manipur and the Naga Hills district was accordingly laid down in 1872. The earlier line of 1842 was maintained in all essential points wherever it could be identified.* A few villages on the dividing line of the waterpent, over which Manipur had acquired supremacy, were

Boundary
between
Manipur
and the
Naga Hills
laid down
in 1872.

* This line was defined as follows:—"Commencing from the upper part of the Jiri river, the western frontier of Manipur, the line of boundary formed (1) by the Dootighur mountain, or that range of hills in which the Mookroo river takes its rise, east on to the Barak river; (2) by the Barak river up to where it is joined by the Tayphani river, which flows along the eastern side of the Popolongmai hill; (3) by the Tayphani river up to its source on the Barail range of mountains; and (4) by the summit or waterpent of the Barail range on to the source of the Mow river flowing north from that point towards Assam.—*North-East Frontier*, p. 107.

demarcated as belonging to that State; and from the termination of the line of 1842, at a point called the Telizo Peak, eastward, the watershed of the main line of hills, which divide the affluents of the Brahmaputra from those of the Irawadi, as far as the Patkai pass, was declared to be the limit of Manipur on its northern frontier. The Naga Hills district was advanced to march with the boundary of Manipur as thus determined.*

Capt. Butler's administration and death in 1876.

Captain Gregory was succeeded by Captain Butler in 1869, and the latter officer, who was by character and disposition admirably qualified for the appointment which he held, proceeded to gradually extend our control over the hill tribes. Survey parties under a proper escort were sent into the hills, and, when at Wokha in January 1875, a cooly was murdered and the camp attacked, the retribution taken was sharp and sudden. Butler's operations were, however, brought to a close before the end of the season, as he was ordered to proceed to avenge Lieutenant Holcombe and eighty of his men, who were treacherously attacked and killed in February by trans-Dikho Nagas.

Previous to this, the first steps for the formal annexation of the Naga Hills had been taken by Captain Johnstone, who, in 1874, was officiating for Captain Butler. He definitely took three villages under his protection, and in token of their submission they agreed to pay revenue to Government. The example once set was soon followed by others. In the winter of 1875, survey operations were

* *North-East Frontier*, p. 123.

re-commenced, but in December Captain Butler received a mortal wound in an ambuscade at Pangti near Wokha. Lieutenant Woodthorpe promptly burnt Pangti, and the neighbouring villages remaining friendly, the work of the survey was carried to completion.

In August 1876, the Chief Commissioner again invited the attention of the Government of India to the continual aggressions of the Angamis, and more especially of the men of Khonoma and Mozema, upon Naga communities living under Manipur, and to the state of perpetual warfare which prevailed amongst the tribes. During the two preceding years, six villages had been plundered and 384 persons killed, chiefly by Khonoma and Mozema. The Supreme Government agreed that steps must now be taken to repress these outrages. While the matter was under consideration, Mozema raided the village of Gumaigaju near Asalu in the North Cachar Hills, and killed six British subjects. In December 1877, the Political Officer, Mr. Carnegy, accompanied by a force of 246 sepoy and police, captured Mozema and burnt the village, but the Nagas still continued to occupy the surrounding hills and harass the British troops. During the course of these operations, Mr. Carnegy was accidentally shot by his own sentry, and the submission of Mozema was finally received by Captain Williamson, the Inspector-General of Police.

In 1877, the Secretary of State assented to the proposal that the headquarters station should be moved into some locality in the interior of the hills, and that the district staff should be strengthened, so as to

An active policy decided on. Mr. Carnegy's death in 1877.

Occupation of Kohima, 1878.

admit of the more efficient management of the tribes. In November 1878, Kohima was occupied without opposition, and by this time sixteen Naga villages had tendered their submission.

Mr. Damant's murder, 1879.

The attitude of the tribes during that cold season was most encouraging, but in June 1879, there were signs of trouble brewing in the powerful village of Khonoma. The clouds, however, seemed to pass away, the villagers paid up a fine that was imposed upon them in July, and Mr. Damant proposed to make a tour in the Ao country during the following cold weather. Before starting, he decided to visit Khonoma, and, on October 13th, he set out with an escort of 21 sepoys and 65 police. It is said that an interpreter from Jotsoma warned him that the village was hostile, and on more than one occasion fell on his knees before him and begged him not to proceed. Mr. Damant declined to believe that there was any danger. Leaving half of his escort with the baggage at the foot of the hill, he advanced with the remainder up the steep pathway leading to the village. The gate was closed, and as he stood before it he was shot dead, and a volley was poured into his escort, who broke and fled. The Nagas then poured out of the village and down the hill, and completely dispersed the troops, killing 85 and wounding 19.

Siege of Kohima.

The news was carried the same day to Kohima, and a messenger was quickly sent to Wokha to call in the small detachment stationed there under Mr. Hinde. On October 21st, Kohima was besieged, but the troubles of the garrison did not last for long, as

on the 27th, Colonel Johnstone marched in, unopposed, with a strong force of Manipuris.

Within the short space of five years three British Officers had been murdered by the hill-men, and it was obviously time that the Nagas should be taught a lesson. A force consisting of the 44th Sylhet Light Infantry (the present 8th Gurkha Rifles), a detachment of the 43rd Assam Light Infantry (the present 7th Gurkha Rifles) and two mountain guns was sent into the hills. Khonoma was assaulted on the 22nd November. In the attack we lost two British Officers—Major Cock, the D.A.A.G., and Lieutenant Forbes; and the Subadar Major of the 44th Native Infantry killed, two British and two Native Officers wounded, and 44 of the rank and file killed and wounded. During the night the village was abandoned, and the Nagas retreated to a strongly fortified position on the crest of the Barail range, where, as they were excluded from their fields and villages, it was decided to reduce them by a blockade. Of the thirteen villages hostile to us, Piphima, Merrima, Sachima, Sephama, and Pachama were attacked and destroyed before the troops advanced against Khonoma, Lieutenant Maxwell being severely wounded before Sephama. The troops moved about the hills and punished the villages that had opposed us, but the Khonoma men still continued to hold out.

Towards the end of January, they perpetrated a raid of unusual daring and atrocity. A party of the beleaguered Nagas succeeded in making their way from the crest of the hill on which they had taken up their position, and marched to Baladhan, a tea-garden

Punitive measures in 1880.

Raid on Baladhan garden in Cachar.

in Cachar, fully 80 miles distant as the crow flies from Khonoma. They attacked the factory at night, killed the manager, Mr. Blyth, and sixteen of the coolies, and burnt down everything in the place. They then returned with such plunder as they could obtain to their original position.

**Submission
of Khonoma
and pacifica-
tion of
district.**

In March, the Khonoma men at last submitted, but they were ordered to vacate their village site, and their terraced fields were confiscated. The latter part of the order was subsequently withdrawn, as it was found impossible to induce them to take up land elsewhere; and no other Nagas ventured to occupy the confiscated fields from fear of possible reprisals. The villagers were assessed to revenue, which was at first imposed at the rate of one rupee, and one maund of rice per house. Subsequently it was altered to two rupees per house, the rate usually paid at that time by other hill tribes in Assam; and the process of pacification and the extension of our rule was steadily continued. For some time, however, small punitive expeditions were a regular feature of the administration of the district, as it was only by this means that independent Nagas could be taught that the lives and property of those who had submitted to us must be respected. None of these expeditions met with any serious opposition, and there was no repetition of the painful incidents of the seventies.

**Burning of
Ratami.**

In May 1888, the Semas of Ratami murdered two Lhotas who were British subjects, and declined to obey the order of the Deputy Commissioner directing them to come in and answer to the charge. A strong force was led against the village by Mr. McCabe. As the villagers

opposed the advance of the troops, it was necessary to open fire, and some 50 or 60 of the enemy were killed. The punishment of Ratami had a most excellent effect, and two other villages that had committed murders paid up the fines imposed without demur.

In 1885, Mr. McCabe made a promenade through the Ao country and met with no serious opposition, and in 1889 this territory was incorporated within the boundaries of the district. In April 1888, Mr. McCabe crossed the Dikho with a small force of military police, to punish the four villages Yajim, Chihu, Noksen, and Litam, who were guilty of raiding on the western or British side of the Dikho. The four villages were burned, and, though some resistance was offered, it was brushed aside without much difficulty. The Mozung tribe of Nagas, to which these villages belonged, were not, however, the men to acquiesce in punishment of this kind, without attempting reprisals. They found themselves unable to offer any effective opposition to our troops, but in June 1888, they suddenly attacked the two Ao villages of Mongsemdi and Lungkung, and killed 148 persons in the former and 40 in the latter. Steps were immediately taken to protect our territory from a repetition of these outrages, and a guard of 50 men was posted in a strong stockade at Mongsemdi. The stockade was attacked shortly afterwards at night by a body of Mozung Nagas, but they were beaten off without difficulty. In January 1889, the Deputy Commissioner led a force of 200 men across the Dikho to punish the offenders. Feeling that the troops were too strong to be opposed, they offered little resistance, and burnt five

Raid and
punishment
of Mozung-
jami in 1888.

of their villages, in the hope apparently that this would serve to check our advance. Altogether ten villages, including Mozungjami, were destroyed, with a considerable quantity of grain; but only five or six of the enemy were killed, and the expedition failed to recover some captives who were said to have been carried off from the Ao villages. On his return from Mozungjami, the Deputy Commissioner was again compelled to recross the Dikho, to punish Tangsa and two *khels* of Yangia, who had been guilty of murdering Nagas who were to all intents and purposes the subjects of the Crown. It was found impossible to procure the surrender of the actual offenders, and the houses of the guilty communities were therefore burnt.

The Nagas mistake justice for timidity, and Yampong is burnt in 1892.

In 1892, the village of Yampong was burnt, under circumstances which clearly show how prone the savage is to mistake clemency for weakness. A native of a village called Sangtam killed an Ao who had crossed the Dikho on a trading expedition, and then fled to Yampong. The Deputy Commissioner proceeded to Yampong and demanded the surrender of the murderer; but the villagers declared that they were unable to comply with his request as the man had fled once more and they were ignorant of his whereabouts. The Deputy Commissioner then burnt the murderer's house, and ordered the people of Yampong not to harbour him in future; but as they were not in any way responsible for the murder did not inflict any punishment upon them. Fear was the only motive to which the Nagas could ascribe such leniency, and Yampong at once proceeded to attack the villagers that had furnished the expedition

with supplies. The Deputy Commissioner was accordingly compelled to return; the people of Yampong opposed his advance, and then evacuated the village, and, as they declined to come in and surrender or pay a fine, there was nothing for it but to fire the houses. Shortly afterwards the villagers tendered their submission, and thus afforded another instance of the good effect exercised on the Naga mind by the burning of his home. As far as that part of the country was concerned, it was, the Deputy Commissioner said, an undoubted fact that burning a village led almost immediately to the establishment of good relations with the inhabitants. Strangely enough, after they had been burnt out, the people seemed to consider that they had become the children of the Maharani.

Since that date it has only been necessary to despatch one regular punitive expedition, though the Deputy Commissioner, when touring in what was known as the area of political control, was generally accompanied by a guard; and from time to time it was found necessary to punish villages who declined to surrender the actual persons guilty of a murder. In November 1903, the Pelasi *khel* of Mozungjami killed two Aos who had gone across the Dikho to trade, and in the following month the Chongpu *khel* carried off three mithun from British territory. It was impossible to obtain reparation for these outrages, and in January 1905, the Deputy Commissioner proceeded to the village with a force of 100 men of the military police. The inhabitants abandoned their homes, and killed two of the transport coolies who were straggling, and as a punishment the Deputy

Only one expedition in the past thirteen years.

Commissioner burnt the village and killed a considerable number of pigs and cattle.

Alterations
in the area
of the dis-
trict in
1905.

Since the incorporation of the Ao country, the area of the district has been diminished by the transfer of the valley of the Dhansiri and the Mikir Hills to Sibsagar and Nowgong, and increased by the addition of the territory which was formerly known as the area of political control, and a strip of country lying on the east.

CHAPTER III.

POPULATION.

Area and density—Towns and villages—Growth of the population—Immigration—Sex and civil condition—Infirmities—Religions—Occupations.

Few districts have experienced more changes in their boundaries, and consequently in their areas, than the Naga Hills. In the previous chapter it has been shown that the boundaries of British territory have been slowly and gradually extended, and this, where the adjacent country is occupied by savage tribes, is a process that is always liable to be continued. The independent villages from time to time raid into British territory, or murder British subjects who have gone for purposes of trade beyond the frontier, and punishment and pacification follow in due course. The villages beyond our frontier are enamoured of the security that our rule affords, and apply to be taken under our protection, and the boundaries of the district have accordingly been from time to time enlarged. In 1890, the country occupied by the Aos was

Area and density.

formed into the subdivision of Mokokchung, and in 1903, the area of what was known as the Political Control was definitely incorporated in the district. The construction of the railway through the Nambar forest up to Lakhimpur has, on the other hand, rendered it easier to administer the valley of the Dhansiri and the Mikir Hills from Nowgong and Golaghat, and in 1898, a large portion of the district of the Naga Hills was transferred to Sibsagar and Nowgong. In 1901, the area of the district was 3,070 square miles, the population was 102,402, and the density 83 to the square mile. The area of the Kohima subdivision was 2,837 square miles, and the density 29 to the square mile, while in Mokokchung, which covered an area of 738 square miles, there was a density of 46.

At first sight, these figures would suggest that the district is sparsely peopled, but this is not the case. A country which is entirely composed of hills must obviously include large tracts of land which are quite unfit for cultivation. Most of the remainder is only fit for *jhuming*, and *jhuming* postulates a large area of fallowing land.* In parts of the district there is no doubt plenty of waste land on which *jhum* crops might easily be raised, but this is not the case in the Angami territory. Some of the larger villages

* It is true that the Maring Nagas in Manipur who cultivate on the *jhum* system have not sufficient land to allow of their leaving it fallow for any length of time, but the crops obtained are poor, and the *jhums* are covered with an elaborate system of herring-bone drains to prevent the rain from washing all the surface soil from the slopes.

like Khonoma are positively pressed for land, and the people have carved out into terraced rice fields the most precipitous and unlikely looking slopes.

In 1901 the district contained one town, if town it ^{Towns and villages.} can be called, and 292 villages. The Naga villages are very different from the straggling groves of plantains, palms, and bamboos, to which, in the plains, this name is usually applied. They are generally built along the tops of hills, and in the old days of intertribal feuds were strongly fortified and entered through a village gate. In the plains of Assam it is often hard to say where one village ends and the next begins; but there is none of this uncertainty in the Naga Hills. The village is like a little town which often stands out sharp against the sky line, and it possesses distinct and definite village lands which are cultivated by its inhabitants, or are sometimes let to their less fortunate neighbours.

Amongst the Aos and Lhotas the houses are generally arranged in regular streets along the tops of the ridge. The Angamis and the Semas place their houses in any locality within the village wall that seems convenient. The hill on which Khonoma stands is very steep, and the houses are built on little terraces along the sides. The roof of one house is often several feet below the plinth of its next-door neighbour, and some of the village paths are quite precipitous. Building land is very scarce, and a site will fetch from Rs. 300 to Rs. 400. The following description of an Ao village is taken from Colonel Woodthorpe's Report on the survey operations in the Naga Hills in 1874-75.

"The villages, which are usually large, as a rule occupy the most commanding points along the ridges, and the approaches to them are exceedingly pretty. Broad roads, bordered with grass and low shrubs, lead up, through avenues of fine trees, to the main entrance, which is generally very strongly guarded by two or three panjied ditches, running right across the ridge and stockaded on the inner bank. The stockades are strongly built of a double line of posts, supporting a wall of interlaced bamboo, and are capable of offering a good resistance. The outermost ditch is generally about 200 or 300 yards, or even more, away from the village, the second being situated between it and the one enclosing the village. The gate through the stockade of this last ditch into the village is cut out of one huge block, and is frequently four or five feet broad and about six feet high. A large gable roof is constructed over it, giving it a resemblance to our old lychgates at home. Lookouts are built commanding the entrance, and in some cases little huts are constructed in large trees outside the most advanced stockades on the main roads, communications being preserved with the interior by means of long ladders and causeways."

Many of the village gates are still in existence, great doors made of thick planks, adorned on the outside with roughly carved bas-reliefs of animals and men. But they are almost invariably left open, and, even were they closed, the would-be-visitor would have no difficulty in walking round them. When a *ghenna* is in progress the gate is closed, and visitors are rigorously excluded. The Naga villages are extremely dirty, the cattle, fowls, and pigs all live in the house inhabited by the family, and there is generally a great heap of manure in the courtyard. The houses are packed close together, and there are no fruit trees, bamboos, or gardens round them. But this absence of vegetation has no doubt a most salutary effect, as it leaves the place exposed to the purifying influence of the sun and air.

The following abstract shows the total number of

KOHIMA.

villages occupied by each tribe at the last census, and the average population of each village:—

					No. of villages.	Average population.
Angamis	...	...	...	...	64	450
Lhotas	...	...	...	...	61	293
Aos	...	...	...	...	52	578
Rengma	...	...	...	...	10	420
Kacha Naga	...	...	...	...	26	248
Sema	...	...	...	...	9	523
Kuki	...	...	...	...	26	128

The largest villages are to be found amongst the Angamis and the Aos, and some of the more important ones almost attain the dignity of little towns. The village of Kohima, for instance, which stands on the hill just above Kohima station, contains over 800 houses, and has a population of nearly 3,000 souls.

The station of Kohima is situated on a saddle on the watershed, and commands a fine view down the valley of the Rengmapani or Zubza to the north, and over a great expanse of hilly country towards the east. There is none of the fine open rolling country which is the great attraction of Shillong, and the roads are cut out along the edge of the hill-sides, which fall away in sharp ravines from the watershed. In the centre of the saddle stands the old fort, in which are situated the treasury, the magazine, the post and telegraph office, and the office of the Deputy Commissioner. A little to the east, but lower down the hill, are the parade ground and the quarters of the regimental officers, with the sepoys' lines in the immediate vicinity. On the northern side of the saddle are the military

police lines, the shops of the few traders that the town possesses, and a very small bazar, supplies being extremely scarce in Kohima. A little further down the hill are the huts of a few Manipuris, Khasis, and Nagas who have left their native villages to take up their residence in the metropolis of the district. The station is lighted by nine acetylene lamps, and has an excellent but somewhat scanty water-supply, which is brought from Polubadze hill, and distributed by pipes all over the civil lines and the cantonment.

Growth of
the popula-
tion.

1881...95,570
1891...98,687
1901...102,402

It is difficult to measure the growth of the population in the district. The first census was taken in 1891, and, though a careful estimate was made in 1881, the district as then constituted did not include the Mokokchung subdivision (population 1891—26,416), and did include the valley of the Dhansiri and the Mikir Hills, which, in 1898, were transferred to Sibsagar and Nowgong. The abstract in the margin shows the population based on the assumption that the boundaries of the district were the same in 1881 and 1891 as they were at the last census. It will be seen that the increase is comparatively small, but the Nagas are by no means a prolific race. In 1901, there were only 85 children under five for every 100 married women between 15 and 40, as compared with 115 and 110 in Nowgong and Kamrup. The number of childless married couples is unusually large, and even where a woman does have children it is seldom that she becomes the mother of a large family. The Nagas pride themselves on the strength and endurance of their womenkind, and say that in these respects they

are little inferior to the men. These qualities have doubtless been developed by the continuous hard work they are called on to perform, and such development is not unfrequently attended by a weakening of the reproductive powers. The Semas form an exception to the general rule, and this particular tribe is said to be increasing rapidly in numbers.

There is little immigration into the hills, and <sup>Immigra-
tion.</sup> in 1901, 94 per cent. of the population had been born within the boundaries of the district, while another 4 per cent. were natives of Assam. Most of the foreigners were Nepalese, who were either serving in the regiment or the military police battalion, or had taken their discharge and settled down to cultivation. The rest of the foreign population consisted of a few coolies and cartmen from Bengal and the United Provinces, a few artisans from the Punjab, and a few traders from Marwar. Emigration from the district could not be measured with any degree of accuracy, owing to the changes in boundary that had recently taken place. A certain number of Nagas go down to the plains in the cold weather to trade or to look for work on tea-gardens, but there is very little migration of a permanent character, the hillman seldom caring to leave his native village.

In 1901, there was a preponderance of the male <sup>Sex and
Civil condi-
tion.</sup> element in the population, there being only 982 females to every 1,000 males. This disproportion between the sexes is, however, entirely due to the foreigners, and amongst those born and censused in the district the number of women was almost exactly equal to

the number of the men. Women are in a minority amongst the Angamis and the Kaccha Nagas, and in a majority amongst the Lhotas and the Aos. Infant marriage is practically unknown. Out of the 29,621 females in the district, who in 1901 had performed the marriage ceremony, only 114 were below the age of 15. Most of the tribes allow their girls great liberty, not to say license, prior to their marriage, but so long as they are living with their husbands they generally make faithful wives. The Lhotas are, however, an exception to this rule, and amongst them the *ménage à trois* is by no means unusual. Many of the customs that govern the relations between the sexes are distinctly curious. The Angamis, for instance, shave the heads of their unmarried girls, a fashion which goes far to counterbalance the effect of the good looks that many of them undoubtedly possess. Bachelors, too, are required to wear their hair in a fringe which is strongly suggestive of a coster belle and which is extremely unbecoming in comparison with the waving locks that adorn the forehead of the married man. The different customs of the various tribes are, however, discussed at length in Mr. Davis' monograph on the Nagas, and need not be referred to here. The slow growth of the population, to which reference has been already made, is, perhaps, to some extent due to the fact that the proportion of potential mothers, *i.e.*, of married women between 15 and 40 is below the Provincial average. They form only 152 per mille of the total population as compared with 157 per mille in the Province of Assam as a whole, and 170 per mille in the Central Provinces.

From the following abstract it will be seen that, *Infirmities.* though the district is singularly free from leprosy, deaf-mutism and blindness are extraordinarily common :—

Out of 10,000 males, number afflicted with	Naga Hills.	Assam.	India.
Insanity	... 4	5	3
Deaf-mutism	... 49	9	6
Blindness	... 17	10	12
Leprosy	... 3	13	5

The figures given are for males only, but deaf-mutism is almost as prevalent amongst the women, and blindness is even more common. The Deputy Commissioner, who was consulted as to the accuracy of the figures, wrote as follows: "I am not at all surprised to hear that the rate is very high, as in almost every village, certainly amongst the Angamis, there are deaf mutes. In some of the smaller villages every second person is either deaf or dumb, or insane. This I know from my personal experience. The small villages to the north of Kohima are the worst in this respect. I can only attribute the prevalence of the infirmity to the results of intermarriage, and the fact that it is more prevalent in the smaller villages would corroborate this, as Nagas, as a rule, marry in their own villages."—

The principal languages spoken in the hills are *Language.* Angami, Ao, Lhota, Rengma and Sema. Ao again is divided into two distinct dialects—Chungli and Mongsen. The number of persons belonging to each of these five tribes, as returned at the census of 1901, will be found in Table II. These languages were originally derived from the same stock, but, at the present day, they have

diverged so far from one another, that a thorough knowledge of one of the five, helps little towards the comprehension of the other four. An excellent account of these languages will be found in the Report on the Census of Assam in 1891, Volume I, pages 168-176, and the Linguistic Survey of India, by Dr. Grierson, Volume III, Part II, pages 194-289.

Tribes.

The principal tribes living in the district are the Angamis, the Aos, the Semas, and the Lhotas; and after them, but *longo intervallo*, come the Kaccha Nagas and the Rengmas. The numbers returned under each of these tribes at the census of 1901 will be found in Table III, but since that date about 80,000 people, most of whom are Semas, have been included in the boundaries of the district. The most warlike and important of these tribes are the Angamis, who occupy the country in the neighbourhood of Kohima. North of them come the Rengmas, then the Lhotas, while north and east of the Lhotas are the Aos, whose villages stretch up to the Dikho river. The Semas live east of the Rengmas and the Aos. Full details with regard to the manners and customs of the various tribes of Nagas will be found in Mr. Davis' exhaustive treatise on the subject. The only other tribes that are found in any numbers in the district are the Kacharis and the Kukis. Accounts of these tribes will be found in the Gazetteer of Cachar, a district to which they more properly belong.

Religion.

The great mass of the Nagas are still faithful to the religion of their forefathers, and in 1901, 96 per cent. of the population were described as 'animistic.'

The people believe in the existence of a supreme creator, but, as, like the Hindu Brahma, his work is done, they do not trouble themselves very much about him. Sickness and other misfortunes which befall them they ascribe to the malignant action of evil spirits, who they endeavour to propitiate with sacrifices. Most of them believe that there is something in a man which survives the death of the body, but what it is, and where it goes, they cannot say. Further information on this subject will be found in Mr. Davis' monograph. Hindus formed 3 per cent. of the population, but practically all of them were foreigners. Hinduism has no attraction for the Naga. In the plains converts gravitate towards it in obedience to the law which draws the smaller body towards the greater. All men like to follow the fashion, even though it may entail considerable personal inconvenience, so year by year the animistic tribes are abandoning their pork, and fowl, and beer, though many a longing eye is cast upon the flesh-pots of Egypt. But in the hills no distinction is conferred by Hinduism, and nothing less than a strong desire for social advancement would induce a Naga to adopt a religion which would impose on him so many troublesome restrictions.

Christianity, too, has as yet made little progress. In 1876, a branch of the American Baptist Mission was opened at Molung, which, in 1894, was transferred to Impur. About 1879, another member of this Mission took up his residence at Kohima, and work was started amongst the Angami Nagas. In 1904, there were altogether four missionaries, three of whom were assisted

by their wives, living amongst the Naga tribes. The number of Native Christians has increased, but progress has hitherto been slow. In 1891, there were 211 Native Christians in the district; in 1901 there were 579, nearly all of whom were Baptists. The Naga is a much more conservative person than the Khasi, and finds it difficult to abandon the customs of his ancestors. Most of them are fairly contented with their present mode of life, and it is hardly likely that there will be any general change of faith for some time to come.

Minor Religions.—Buddhists 337; Moslems 142; Jains 20; Sikhs 3.

The abstract in the margin gives details for other religions which had but few representatives at the time of the last census. Nearly all of these persons were found in the station of Kohima. The Buddhists are Nepalese serving in the regiment or the military police, the Jains are shop-keepers from Marwar, the Muhammadans artisans and traders.

Occupations.

At the census of 1901 the occupations of the people were divided into 520 different heads, for which details will be found in the second volume of the Census Report. This elaborate classification was intended for the more developed parts of India, and the occupations of the natives of a hill district in Assam practically begin and end with agriculture. Agriculture was the means of support of 93 per cent. of the population, but though cultivation is the mainstay of the Naga, he now and then combines it with some subsidiary occupation. Most of them, for instance, will do a little trading if they can, and many of them turn out to work as coolies during the cold weather. The soldiers and military policemen with their families formed 2 per cent. of the population

tion, and 1 per cent. were described as beggars, though these were probably only aged and infirm persons who were supported by their relatives and friends. The number of persons returned under each of the eight main orders, and the proportion that they formed of the whole, was as follows :—

		Percentage on total population.
A. Government	2,388	2·3
B. Pasture and agriculture	96,059	93·8
C. Personal service... ..	424	0·4
D. Preparation and supply of material substance	1,034	1·0
E. Commerce, transport and storage ...	371	0·4
F. Professions	325	0·3
G. Unskilled labour not agricultural ...	364	0·4
H. Means of subsistence independent of occupation	1,437	1·4

CHAPTER IV.

AGRICULTURE AND FORESTS.

Jhum Cultivation—The Terraced cultivation of the Angamis—Agricultural implements—Live stock—Forests.

Jhum cultivation.

THE ordinary method of cultivation practised in the hills is the system known as *jhum*. The jungle growing on the hill-side is cut down, left for six weeks or so to dry, and burned between January and March. The boughs of larger trees, and any rubbish that was not consumed in the first conflagration are then collected and burnt, and the ground hoed up. The seeds of hill rice, millet, and job's-tears are scattered amongst the ashes, or dibbled in, and the fields carefully raked over till they are quite smooth. While the crop is growing it is weeded once or twice. The millet is harvested in July, the rice in November, and the job's-tears in the following month. Chillies, pumpkins, and *til* are also grown in the *jhums*, and on the slopes of the lower hills above Golaghat cotton is an important crop.

The system of *jhum* cultivation has several

drawbacks. The crop is entirely dependent on the rainfall for the moisture it requires to bring it to maturity, much time and trouble has to be expended in the clearing of the *jhums*, and the amount of land required is very large. A *jhum* is, as a rule, only cultivated for two seasons in succession and then allowed to fallow for seven or eight years. After the second year, the yield falls off, and the weeds spring up and choke the crop. There is a risk, too, that the roots of the scrub jungle may be killed; and the land depends to some extent for its fertility on the re-growth of this jungle, and its subsequent conversion into a bed of ash manure. A village thus requires of culturable land about five times the area actually under cultivation at any given time, and the outlying *jhums* of the larger communities must, of necessity, be sometimes situated at a considerable distance from the village site. On the other hand the yield of the *jhum* is large, and as long as they have sufficient land available the Nagas seem to prefer *jhuming* to any other system of cultivation.

A considerable area is *jhumed* by the Angami Nagas, but their desire for rice, which does not do well in *jhums* at an elevation of more than 4,000 feet above the level of the sea, and the pressure of population on the soil, has driven them to adopt the system of terraced cultivation. The slopes of the hills below their villages are cut out into a succession of terraces, which are irrigated from the hill streams, whose water is carefully distributed through little channels over every step in the series. When the slope is fairly gentle these terraces are sometimes nearly twenty yards

The terraced cultivation of the Angamis.

in breadth and not more than two feet high; but fields as large as this are by no means common. The average terrace is more than three feet high, and is not more than three or four yards wide, and is often built up with stone retaining walls. In places these stone walls are as much as five feet high, in places the terraces are not more than two feet wide, and as they have to follow the contour of the hill-side they are never of any considerable length.

An ample supply of water is an absolute necessity for terraced cultivation, and, where this is to be had, fields are cut out on slopes which are almost precipitous in their steepness. Sometimes the terraces are simply dug out of the earth and are not faced with stone, but near Khonoma they even go so far as to build low walls across their *jhum* land to prevent the soil from being washed away by the rain. This system of terraced cultivation was probably introduced from the south, and without it the large and populous Angami villages could not exist, as they have not sufficient land in their vicinity to support them by the wasteful system of *jhuming*.

The initial labour required to make these terraced fields is very great, but, once made, they give less trouble than a *jhum*. They are close to the village site, and jungle clearing is not necessary. Many of these terraces are almost entirely dependent on the rainfall, and fields which can be kept under water during the cold weather are particularly valuable. This irrigated rice is raised in the same way as the *sali dhan* of Assam. The soil is thoroughly saturated with moisture, and then held

up till it is reduced to a rich puddle. The rice has in the meanwhile been sown on the hill-side, and when the plants are from a month to six weeks old, they are transplanted into the fields. Harvesting goes on in December; the ears are cut off short by the head and threshed in the field before being carried up to the village.

The Angamis generally store their grain in the house in huge baskets about four feet high and proportionately wide, but most of the tribes keep it in granaries outside the village, from fear of fire or rats. There is nothing, except his sense of honour and the severity of the punishment that would follow on detection, to prevent a man from helping himself to his neighbour's grain; and the existence of this custom is a striking testimony to the high standard of honesty observed in their relations with one another.

Amongst other crops the Nagas raise cucumbers, Other crops, gourds, a bean not unlike a large variety of French bean, and a little indigo, which is intended solely for home use. A few plants of tobacco are also grown in the village, and the fibre of a nettle is used for thread though the plant is hardly cultivated in the sense in which that term is usually employed. Attempts have been made to introduce the cultivation of potatoes, but they are at present chiefly grown by foreign settlers in the neighbourhood of Kohima. The Nagas are not such radicals and progressives as the Khasis, and are not so ready to abandon the traditions of their ancestors. Cotton is grown by the Lhota Nagas on the lower hills, and in 1903-04, it was estimated that about 4,500 maunds were exported to Golaghat. Maize is grown, but is not much in

favour with the Nagas, and is generally raised by foreigners residing in the district. Oranges are planted by the Lhotas and Aos on the hills overlooking the Sibsagar district, and peaches, pears, pineapples, leeches, mangoes, and European vegetables do well in the lower hills, though they have not yet been adopted by the Nagas.

**Agricultural
implements.**

The following is a list of the agricultural implements in use—(1) a short handled hoe, (2) a dao or bill hook, (3) a bamboo rake, (4) a wooden pestle and mortar, (5) a wooden mallet to break up the clods, (6) a sickle, (7) a bamboo flail, and (8) an axe.

Live-stock.

The live-stock of the Nagas consist of mithun (*bos frontalis*), cattle, pigs, and dogs, the latter being included as they are a favourite article of food. The cattle are a sturdy little breed. There is no dearth of grazing ground, they are never worked, and as they are not milked, the calf does not suffer from want of proper nourishment. The pure-bred Naga bull is black, and if it has no white about it, will fetch from Rs. 40 to Rs. 50, a cow costing from Rs. 20 to Rs. 25. There are no bullocks in the Naga villages, and these animals are simply kept for food and for the manure they yield, great heaps of which are generally to be seen in the court-yard of a Naga house. Mithun are kept by the Kacha Nagas, the Semas, and the Kukis, and cost from Rs. 30 to Rs. 60. The pigs are of the ordinary black Indian breed and are fine healthy animals, in spite of the fact that every male is gelt when it is less than two months old, and that the race is continued by the most immature of sires.

Dogs, as a rule, are the ordinary pariah breed. Foot and mouth disease breaks out occasionally in the hills, but the cattle are, on the whole, fairly free from sickness.

In their natural state the hills were originally ^{Forests.} clothed with evergreen forest. This forest still remains on the more precipitous slopes and in the valley bottoms, but from most of the hill-sides the trees have vanished before the dao and torch of the cultivator, and the sites of fallowing *jhums* are generally covered by a dense jungle of bamboos. There is only one reserved forest in the district, which is situated on the borders of Sibsagar, at the point where the Disai river debouches on the plains. This reserve was constituted in 1902, and covers an area of 68 square miles. The forest covers the low outlying hills and the intervening valleys, and contains nahor (*mesua ferrea*), ajhar (*lagerstræmia flos reginæ*), titasapa (*michelia champaca*), sam (*artocarpus chaplasha*), poma (*cedrela toona*), gunserai (*cinnamomum glanduliferum*), amari (*amoora spectabilis*), khakan (*duabanga soneratioides*), hollock (*terminalia bicolorata*), Hollong (*dipterocarpus bondii*), and hingori (*castanopsis rufescens*). The receipts from this reserve in 1902-03 were about Rs. 1,200. This forest is managed from the Sibsagar district, to which for all intents and purposes it belongs, and generally speaking no attempt is made at forest conservancy or management in the Naga Hills. In order, however, to maintain a supply of timber near Kohima, and to prevent the station water-supply from contamination, the timber on the Pulebadze hill is reserved, and may not be felled except under the order of the Deputy Commissioner. Very little rubber

is tapped in the district, but agar (*aquilaria agallocha* cinnamon, wild cardamoms, and wax are found. Wax was selling at Kohima in 1904 at Re. 1 per seer.

CHAPTER V.

INDUSTRIES—ECONOMIC CONDITION OF THE PEOPLE.

COMMUNICATIONS AND TRADE.

Arts and Industries—Weaving—Iron Work and Pottery—Mats—Salt and Silk—Rents—Wages—Prices—Food—Dress—Houses—Economic Condition of the People—Cart road—Bridle Paths—Post and Telegraph—Trade.

THE industries practised in the hills are small and unimportant. Nearly all the cloths worn by the Nagas are made at home by the women. The loom is of the simplest character, and consists of little more than a few sticks, on which the warp is supported. Descriptions of mechanical processes of this nature are not very intelligible without a complete series of diagrams. Those interested in the subject will find a long account of the Naga methods of spinning and weaving, and of the cloths produced, in the Monograph on the cotton fabrics of Assam, published by the Superintendent, Government Printing, at Calcutta, in 1897, pages 61-63 and 164-174. The cloths are

Arts and Industries

Weaving.

strong and warm, and are generally of a distinctly picturesque and pleasing pattern. The miniature kilt worn by the Angamis as a loin cloth is made of dark-blue thread, and is often embroidered with cowries. Their outer cloth has generally a dark-blue body, with a broad border of green and orange, or red and yellow stripes. Under this they wear a white cloth, with a border of blue or red. The Semas and Lhotas generally wear cloths made of broad stripes of white and blue, while blue and red is the favourite colour of the Aos. The Kacha Nagas affect a white cloth with a narrow border of madder and blue.

**Iron work
and pottery.**

Village blacksmiths make daos, spear-heads, hoes, and knives from imported iron. The iron-work is of a very simple character, but the shafts of the spears and the handles of the daos are sometimes decorated with goats' hair, dyed dark-blue, white, and red. Earthenware pots are made at Viswema and Kuzama amongst the Angami Nagas, and at Chanki and Japu amongst the Aos. The clay is laid on in strips and not fashioned on the wheel, but the outturn is not large, as empty gourds and sections of bamboo are often used where a plainsman would employ an earthenware or metal vessel.

Mats.

Nearly all the tribes make baskets and mats of split bamboo, and the Angamis store their rice in huge baskets about four feet high and of a proportionately wide girth. They are also very clever at making leggings of split cane dyed a bright red or yellow. The village gates sometimes have the rough figure of a man or of a mithun head cut on them; and a wealthy man

occasionally makes some attempt to decorate the front planks of his house. Some of the Angamis erect over the graves wooden figures which possess a certain rude merit, and in both Angami and Sema villages the exploits of a man alike in love and war are commemorated by quaint carvings. Salt is made at the brine wells Salt and silk. of the Kacha Naga village of Lakema. The water is evaporated in iron cauldrons, but the cost of the firewood is heavy, and the salt is sold for 8 annas a seer, or for four times more than the imported article. It is very dirty, and is evidently full of impurities, but that appears to be an additional attraction to the Naga. It is regarded as a luxury and is only used to suck between sips of their national beverage *zu*. Salt is also imported in considerable quantities from the independent villages, Melomi and Primi. An attempt has recently been made to introduce the cultivation of the mulberry silk worm. The climate is doubtless favourable for sericulture, but the dirt of the Naga village is likely to prejudicially affect the worm.

The standard of measurement for Naga land is not ← Rents. area, but the number of loads of paddy that it yields. Terraced rice land is both sold and let. Some years ago, when the construction of the cart road had put a great quantity of money in circulation in the district, rupees, as the Naga expresses it, were 'cheap.' An acre of terraced rice land near Khonoma at that time fetched as much as Rs. 600; but now, that rupees are 'dear,' it can be bought for about one-third of that sum. An acre of terraced rice land lets from three to nine rupees a year according to quality, while an acre of *jhum* land can be

rented for the two seasons, during which it is cultivated for a rupee and a half. It must, however, be borne in mind that the absence of any system of measurement renders the exact pitch of these rents a little doubtful.

Wages. During the cold weather Nagas will work fairly readily on the road for six annas a day. Off the cart road, coolies are the usual means of transport, and receive eight annas a march near Kohima, and from four to eight annas in the eastern part of the district. The government rate is usually accepted by the Nagas as their standard in their dealings with one another, but an exchange of labour often obviates the necessity for making any actual money payment.

Prices. The price of rice is not of much importance except to the foreign population, as the Nagas seldom either buy or sell. Since the construction of the cart road, rice has been comparatively cheap at Kohima, as it is imported from Manipur. Between 1898-99 and 1902-03, it ranged from Re. 1-14 to Rs. 3-8 per maund, which was very much less than the prices previously ruling in the bazar. In 1903-04, it suddenly rose to Rs. 5-4 per maund, as it was feared that, owing to the smallness of the rainfall, the harvest in Manipur would be a very poor one. Since the completion of the railway to Dimapur, there has been a great reduction in the charges on account of freight, and a consequent general fall in prices. Dal and salt sold respectively for Rs. 11 and Rs. 10 per maund in 1896-97, but in 1903-04, they were selling for Rs. 5-8-0 and Rs. 4-8-0 per maund.

Food. The staple food of the people is rice, but the Nagas eat meat whenever they can get it, and are quite

indifferent as to the stage of putrefaction that it may have reached. Beef and pork are probably more often eaten than other kinds of flesh, but this is only because they are more easily procurable. Roasted dog is much esteemed, and, apart from milk, there is hardly anything which the Naga will not eat. Why they abstain from milk is not quite clear. They do not seem to have any prejudice against it, but say that they have never learnt to milk their cows, and that if the calf is deprived of milk it cannot thrive. They have no prejudice against the leavings of a European, and a Naga gladly accepts anything that may be over from the Saheb's lunch, and picks the chicken bones as cleanly as a dog. When a cow is killed the bones are not thrown away till every particle of flesh has been gnawed off them, and the houses often reek with the stench of these putrifying fragments. All the tribes consume enormous quantities of rice beer, which seems to serve as food as well as drink. The way in which this beer is brewed is described in the paragraph on excise.

The dress of the Nagas varies from zero to a comparatively high figure, both from the point of view of quantity and quality. The dress of the naked Nagas, who live in the extreme north-east corner of the district, consists of a few strips of blackened cane or a broad strip of white bark, bound tightly round the waist, a large tail of bark being often left hanging down behind. The Angami Naga, on the other hand, will wear in the winter as many as four large shawls, which afford a really efficient protection against the cold. Their small blue kilts are often embroidered with

cowries; and their gaily-coloured cane gaiters, their ornaments of pigs' tusks, and their collarettes and armlets of goats' hair dyed flaming red, are remarkably effective and picturesque.

Houses.

The Naga house is almost invariably dark and dirty, but the style of building differs very considerably amongst the different tribes. The Angami house is faced with planks, and has a thatched roof that slopes from the ridge pole to within a few feet of the ground. The side walls are made of reeds, or thatch, or planks, and, as they have no windows, the interior of the building is extremely dark. A fair-sized house is about 28 feet long and 22 feet broad, and the roof projects some four feet more in front of the front wall, thus forming a small porch. The house is divided into three rooms. In the outer room stand the huge baskets in which the rice is stored, and it is here that the cattle are stabled for the night. In the inner rooms the family cook, and eat, and sleep. An Angami house is usually a very filthy place. The floor is made of earth, fowls and cattle live with the family, and in addition to this there is often a horrible stench from putrifying flesh. The people sleep on planks, and for their bedding use a quilt made out of old clothes patched together. The houses of the wealthy men of the village are built on the same plan but are larger, and the planks in front are sometimes adorned with simple carvings. If the owner has performed a special *ghenna*, he is allowed to put up two curved beams in the front of the house, which meet over the roof tree in the form of horns, and are a conspicuous feature in an

Angami village. The houses of the other tribes differ to some extent from those of the Angamis, and are described at length in Mr. Davis' Monograph.

Most of the Nagas have a sufficiency of food and clothing, but there is little accumulated capital, and some villages are said to experience difficulty in raising the very moderate revenue imposed on them. Apart from the cotton, chillies, and *pan* exported to Golaghat, there is nothing grown for sale, and cash is generally obtained by working for the Public Works Department, and occasionally on tea-gardens in the winter time. The cash expenditure of the people is, however, very small, and generally they seem fairly well-to-do. The following account is taken from the report of the Deputy Commissioner in 1901-02:—

Economic
condition of
the people.

“Rather than cultivate sufficient rice to supply their wants, the Kukis prefer to loaf, and to subsist towards the end of the season on jungle roots and plants. The Kacha Nagas are nearly as bad. One would think they would be glad to earn a little money by working on the bridle path, and doing cooly work, but this is not the case. They never lose an opportunity of trying to get out of doing the very small amount of cooly work which they are called upon to perform. The other tribes in the district, except the people of Tamlu, who are confirmed opium-eaters, are extremely industrious and hard-working, and withal light-hearted and good-tempered. It is pleasant to see them trudging up to their villages at dusk, singing and laughing after a long day's work. The Angamis particularly like good living and fine clothes, and do themselves as well as they can afford to. One is glad to think that their material prosperity has greatly increased since our advent to the district. I am told that in the old days a man with three *dhulis* of *dhan* in his house was considered wealthy. Now it is a common occurrence to find five or six *dhulis* in an ordinary house, while in wealthy houses there are many more.

Their lives being secure, they can cultivate at greater distances from their villages than formerly. Their cattle, too, are safe from hostile raids, and can be pastured on the best grazing grounds, however far from the village. Judging from the anxiety of tribes outside our border to be brought under our control, our rule appears to be popular among Nagas, and I think the older men enjoy the security of life and property which now obtains. It is, however, inevitable that the younger men should regret that the paths of glory are closed for them. The lot of a Naga under us is far from unhappy. As long as he pays his house-tax, takes his infrequent turn at cooly work, and refrains from quarrelling with or looting his neighbours, he lives in absolute peace. The civil police are confined to Kohima station and the cart road, and cannot enter a Naga village or take up a Naga case without special orders. There are no petty native officials to make their lives a burden to them. The simple rules for the administration of justice are suited to the people, their cases are enquired into by the Deputy Commissioner or his assistants personally, and their civil and petty criminal cases are decided according to their own customs. As a people they are neither insolent nor cringing, and if they think they are wronged by any order they will say so plainly. It is these qualities of frankness, cheerfulness, hospitality, and obedience which have endeared them to all those officers who have been stationed among them long enough to obtain a knowledge of them and their ways."

Communica-
tions.

The only cart road in the district is the section of the great road which runs from Neghereting on the Brahmaputra to Imphal the capital of Manipur. The opening of the Assam-Bengal Railway has rendered Dimapur to all intents and purposes the terminus of the road, and this is the point at which it enters the district of the Naga Hills. The first $8\frac{1}{2}$ miles run through the Nambar forest to the foot of the hills at Nichuguard. Here it enters the beautiful gorge of the Diphupani, and the next bungalow is situated at Ghaspani (1,527 feet)

10 miles away. From Ghaspani to Piphima (3,018 feet) it is nine miles; from Piphima to Zubza (3,018 feet) nine miles, and from Zubza to Kohima (4,734 feet) $10\frac{1}{2}$ miles. Eleven miles beyond Kohima there is a bungalow at Jak-hama (5,504 feet), and the frontier of the district is reached at Mao Thana, nine miles further on. Four miles beyond Mao the summit of the pass is crossed at an elevation of 5,600 feet above the level of the sea, and from this point the road gradually descends to the fertile valley of Manipur. At each of the halting-places mentioned there is a comfortable and well-appointed staging bungalow in charge of a chaukidar. At present only about 14 miles of the road between Mao Thana and Dimapur are metalled, and the unmetalled portions become almost impassable for wheeled traffic during rainy weather.

The cart road crosses the district from west to east, and a ^{Bridle} path runs right through it from south to ^{paths.} north. Starting from Henima, where there is a rest-house, it is 76 miles to Kohima, rest-houses being maintained at Jossema, Lakema, Pedi, Yekwera and Khonoma on the 12th, 32nd, 42nd, 58rd, and 65th mile respectively from Henima. From Kohima the path runs through Wokha, Mokokchung and Tamlu, till it reaches the plains at Geleki in the extreme north of the district. The following is a list of the inspection bungalows situated along this road; the figure in brackets indicates the distance in miles of each from Kohima: Nerhama (18), Chichama (21), Themokidima (84), Kotsoma ($42\frac{1}{2}$), Wokha (52), Koio (60), Nungtang (71), Nankam (81), Mokokchung (91), Mongsemdi (106), Santong (119), Merangkhang (127), Tamlu (135), and Geleki ($151\frac{3}{4}$). Another bridle path goes

from Kohima eastwards to Cheswejuma ($28\frac{1}{2}$ miles) and is continued from that village for another 85 miles to Shitzu in the Sema country, where it joins the bridle path just described. The following inspection bungalows are maintained along this road; the figure in brackets represents the distance in miles of each from Kohima : Cheswejuma ($23\frac{1}{2}$), Satazuma ($35\frac{1}{4}$), Zulhami ($43\frac{1}{2}$) Kilomi ($52\frac{1}{4}$), Satakha ($65\frac{3}{4}$), Ghukia ($74\frac{1}{4}$), Emilomi ($82\frac{3}{4}$), Auchakalimi ($92\frac{3}{4}$), and Lumhami ($101\frac{3}{4}$). From Wokha a path leads to the plains at Ghiladhari Jan. The total distance is $44\frac{1}{4}$ miles, and there are inspection bungalows at Yekum ($9\frac{1}{2}$ miles), Sonigaon ($19\frac{1}{4}$ miles), Bhandari ($33\frac{1}{4}$ miles), and Goronga Jan ($45\frac{3}{4}$ miles) from Wokha. There is also a bridle path from Mokokchung to Charali in the Jorhat subdivision. The total distance is $47\frac{1}{2}$ miles, and there are inspection bungalows at Chuntia (8 miles), Cholemsen (20 miles), Lakhu ($31\frac{1}{2}$ miles), and Charali (48 miles) from Mokokchung.

**Post and
Telegraph.**

In 1904, there were post offices in the district at Kohima, Impur, Mokokchung, Nichuguard and Wokha. The office at Kohima is a combined post and telegraph office. Ninety-five thousand letters and post-cards were delivered from these offices in 1903-04. Eighty-three savings bank accounts were open in that year for a total value of Rs. 13,000. The mail is brought from Calcutta by the Assam-Bengal Railway to Manipur road station, and is carried thence along the Dimapur-Manipur cart road by runners past Nichuguard to Kohima and thence through Mao to Manipur. There are no post offices between Nichuguard and Kohima, but the traveller can post and receive letters from an "open bag" carried by

the runners. Mails are also carried from the Sibsagar district past Mokokchung to Impur, and from Kohima to Wokha. The open bag system is in force along the whole of the Dimapur-Manipur road. The time at present taken in transit is twelve hours from Dimapur to Kohima, and five hours from Kohima to Mao.

There is not much trade amongst the Nagas except ^{Trade.} in beads and shells. Each household produces practically all that it consumes, and there is no surplus for disposal. Some villages, however, make a speciality of pottery, others of spear heads, others of earthen pots or leaf waterproofs; cattle are reared for market in one place, dogs in another. Most of the business is transacted on a cash basis, and there is very little barter. The principal trading communities are Khonoma, Jotsoma, and Mozema, and men from these villages will go as far afield as Bombay, Calcutta, and Rangoon. A few years ago large profits were made by carrying beads through Manipur to Burma, where they sold for four or five times the amount that they had cost. The Burmese market is, however, getting overstocked, and prices are no longer what they were. There are no such things as village markets, and hardly any shops except in Kohima Bazar, and here and there along the cart road. There are altogether eighteen shops in Kohima, thirteen of which are kept by Marwari merchants, while one is a grocery and general store for the use of Europeans. The Marwaris deal in salt, oil, cloths, grain, umbrellas, thread, and the other articles which are usually to be found in a *kaiya's* shop; but the bulk of their customers are foreigners, and the Nagas only

come to them for salt, thread, and the brass wire from which they make their ornaments. The trade from Manipur passes along the cart road through the district, but, apart from this and the cotton of the Lhotas, there are very few goods exported from the hills. Though honest in their dealings with their fellow-villagers, the Nagas are ready enough to take advantage of the stranger. The Naga cotton is generally watered on the way to Golaghat, and Mr. Damant reported that, as far back as 1878, the Angamis tried to pass off silvered two-pice pieces as rupees, and to sell powdered charcoal as gunpowder to the less sophisticated villagers.

CHAPTER VI.

ADMINISTRATION.

Revenue—Excise—Public Works—Government—Criminal and civil justice
—The Garrison—Civil Police—Jail—Education—Medical.

THE total revenue of the district is extremely small, **Revenue.** and the great bulk of it is derived from the house-tax, which is assessed in lieu of land revenue. Angamis pay Rs. 3 per house, other natives of the district Rs. 2, and foreigners Rs. 5. This tax is collected by the village headmen, who generally receive a commission of $12\frac{1}{2}$ per cent for their trouble; but so democratic are the Nagas that the villagers often compel them—to refund their commission as a rebate to the assesseees. The receipts on account of income-tax are inconsiderable, and a large part of them are derived from the salaries paid to Government servants. Only one Naga was assessed in 1908-04. Details for the various heads of revenue will be found in Table VI. The Registration Act is not in force in the Naga Hills. Nagas are not required to pay court-fees in criminal cases, though in civil disputes the ordinary fees are levied from Angamis. Foreigners pay the usual fees both in criminal

and civil cases. The revenue raised under this head is very small.

Excise. The excise revenue of the district is very small. There are one opium shop, one ganja shop, and one country spirit shop at Kohima for the use of foreigners, but the Nagas do not take opium or ganja, and seldom care to waste their money on country spirit. The quantity of opium and ganja consumed and the receipts under each head of excise will be found in Table VIII. The Nagas are, however, great drinkers of rice beer, of which there are two brands, *zu* and *kezu*.

Both kinds are made from millet and job's-tears as well as from rice. *Zu* is a very nourishing and not unpalatable liquor which can be taken in large quantities without bad effects, but *kezu* is much stronger and comparatively soon brings on intoxication. A kind of gruel, called by foreigners *sakha modhu*, can, however, be prepared from *kezu* and is much in favour in the Ao and Sema country.

Public Works. All the bridle paths in the district with the inspection bungalows along them have, since 1908, been in charge of the Deputy Commissioner, with the exception of the short length from Kohima to Khonoma. Each village is held responsible for the section of the path that passes through its land. The villagers are required to clear the jungle twice a year and to dress the surface once, to clear all drains, and to remove all trees, stones, and earth falling on the road. For this they are paid at an average rate of about Rs. 30 per mile. The public buildings at Tessima, Wokha, and Mokokchung are also under the charge of the Deputy Commissioner,

with the exception of those occupied by the military police, which are maintained by the Commandant of the battalion. The Executive Engineer stationed at Kohima is in charge of the more important public works in the Naga Hills and Manipur. He is usually assisted by an Assistant Engineer and a staff of five upper and five lower subordinates. The principal work in charge of the department is the great Dimapur-Manipur mountain cart road to which reference has been already made in the section on communications. None of the public buildings in Kohima are of any size or importance. They were erected at a time when the cost of all building materials was very heavy, and to a great extent are made of corrugated iron.

For administrative purposes the district is divided into two subdivisions—Kohima and Mokokchung. The Deputy Commissioner is stationed at Kohima, and is allowed one assistant, who is generally a European. Mokokchung is usually entrusted to an Assistant Superintendent of Police. The duties of the Deputy Commissioner have been, and still are, mainly of a political character.

The High Court of Fort William in Calcutta has no jurisdiction in the district, except on its criminal sides, over European British subjects: the Codes of Criminal and Civil Procedure are not in force, and the Deputy Commissioner is empowered to pass sentences of death and imprisonment up to the maximum amount provided for the offence. The death penalty and sentences of seven years' imprisonment or more require, however, the confirmation of the Chief Commissioner. Litigants may appeal to the Deputy

Government.

Criminal and Civil Justice.

Commissioner from the decision of his assistant within sixteen days. No appeal lies as a matter of right from sentences of less than three years' imprisonment passed by the Deputy Commissioner, but all sentences in excess of that limit are appealable to the Chief Commissioner.

From Table V. it will be seen that there is not much litigation in the district. Assaults and thefts are the offences which are most common, but the old spirit of savagery occasionally breaks out, and the disputing parties decide to settle their quarrels by a stand-up fight. Lives are not unfrequently lost in these riots, but homicides of this character are far less objectionable than the murders which are still occasionally committed from the simple lust of killing. In 1896, a Garo chaukidar, his wife a Nagini, their baby, and another Naga were murdered within fifteen miles of Kohima, from the sheer joy of slaughter; and head-taking is still in full swing on the eastern side of the Dikho. In 1900, when the Deputy Commissioner was touring in these hills he was informed that the village of Yajim had recently raided Kamahu, and had taken sixty heads, most of which had belonged to defenceless women and children. The gallant head-hunter avoids as far as possible all risk of opposition, and much prefers to take the head of an unarmed child to killing a full-grown man in open combat.

The rules provide for the trial of petty cases by the village elders, but most of the Naga villages are very democratic in their institutions, and there are few people of sufficient weight and influence to be able to enforce obedience from an unsuccessful litigant. A Naga trial

is rather a curious spectacle. The two parties stand before the seat of justice, separated by one or more interpreters, with whom they engage in the most animated converse. The proceedings are generally of a very friendly nature, and if one of the parties can be induced to swear to anything, the other side are generally prepared to accept the statement sworn to as correct. The administration of the oath is, however, a very solemn business. The juror unties the little tag of hair at the back of his head, and the spectators all take care to see that his cloth is worn the right side up and his shoulder bare, as the neglect of these formalities would render it possible for him to indulge in perjury with impunity. The juror states his case at length and swears that this statement is correct, praying that, if he lies, both he and all his family may come to a speedy and a violent end. The by-standers listen with the greatest of attention, and are quick to detect and object to any variation in the form of oath which custom has prescribed. Once the oath has been duly sworn the other party departs completely satisfied. At first sight it seems strange that such cases should not be settled out of court, but it is said that if the dispute is decided in the village, there is risk of the parties coming to blows; and with people whose natural instincts are of so bloodthirsty a character, blows soon develop into murderous affrays. The case, too, if decided in cutcherry, receives the sanction of Government, the only authority for which the Nagas have very much respect, and the order passed forms part of a permanent record with regard to which there is no room for

dispute. Civil litigation is, of course, not heavy, and in 1903, only 195 civil suits were filed. One suit was valued at nearly Rs. 14,000, but the average value of the remainder was only Rs. 75.

The Garrison.

The garrison of the district consists of two companies of a Native Infantry regiment stationed at Kohima, and a battalion of military police, which has a strength of 14 officers and 657 non-commissioned officers and men. The battalion is armed with Martini Henry rifles, Mark IV, kukris, and bayonets. The headquarters of the battalion are at Kohima, and its strength is not dissipated over many outposts. At the extreme west of the district Henima is held by a native officer and 25 rifles. A native officer and 25 men are stationed on the top of the hill on which the turbulent village of Khonoma is built, eleven miles by road from Kohima. At the headquarters of the Mokokchung subdivision there are two native officers and 107 rifles, and a native officer and 50 men at Tamlu in the extreme east of the district. The battalion served with distinction in the Naga Hills expedition of 1879-80, the disturbances in Manipur in 1891, and the Abor expedition of 1894.

Civil Police.

The civil police consists of 29 head constables and men, under a sub-inspector. There is a police station at Kohima, with outposts along the cart road at Nichuguard, Piphima, Zubza, Birreru, and Viswema. The civil police are chiefly concerned with the supervision of the traffic on the cart road, and are not allowed to enter a Naga village or take up a Naga case except under special orders from the Deputy Commissioner.

Jail.

The only jail in the district is situated at Kohima.

It consists of a few small buildings with roof and walls of corrugated iron surrounded by a bamboo palisade. It contains accommodation for twenty-four convicts, and ten sick and under-trial prisoners. Convicts sentenced to hard labour are employed in the garden or on the station roads, or at the oil mill.

Education has as yet made little progress in the hills. Education. There is a middle English school at Kohima which, in 1908-04, had a daily average attendance of seventy-seven boys, but not more than nine or ten were the sons of natives of the district. On March 31st, 1904, there were six lower primary schools maintained by Government, at Mokokchung, Wokha, Henima, Khonoma, Jakhama, and Cheswejuma, which had altogether a daily average attendance of one hundred and ten pupils, and sixteen Mission schools* which receive grants-in-aid from Government. There are also two training schools at Kohima and Impur. Arrangements have recently been made to teach the Angamis and Aos to read and write their own language in the English character, as the Naga has no written character of its own. This marks a great advance on the former system under which boys were taught to read and write in Assamese, but it is at present subject to the drawback that there are very few printed books in Ao or Angami. Naga boys have accordingly to be taught to read from the Gospel according to St. John, or the Acts of the Apostles, which must be rather strong meat for these wild and savage babes.

* Situated at Mohung, Yagong, Siramen, Wamaken, Myrang Kong Akoia, Asangma, Waramung, Chilemsen, Janki, Mangmatong, Namkam, Ungma, Lungsa Lungpa, and Lungzang.

There were altogether 571 boys and 76 girls at school in 1903-04, or 4 per cent. of the children of school-going age, but the Nagas have not yet learned the advantages of education, and a certain amount of judicious pressure is required to induce them to send their children to be taught.

Medical.

The district is in the charge of a Civil Surgeon, and contains two hospitals, situated at Kohima (ten beds), and Wokha (four beds), and one dispensary at Mokokchung. Vital statistics are only recorded at Kohima, so that there is no detailed information available with regard to the mortuary statistics of the people. Malarial fever and lung affections are probably responsible for a considerable proportion of the total casualties, and epidemics of measles and influenza occasionally claim a long tale of victims. Dysentery and cholera sometimes appear amongst the lower villages, but cholera is fortunately comparatively rare. The hillmen have a wholesome dread of infection, and do not scruple to evacuate a village if the circumstances are sufficiently serious to warrant such a measure. The following description of the conduct of the Samaguting Nagas when confronted by a single case of small-pox is taken from a report by Mr. Carnegie in 1877* :—

The disease was treated as a personal enemy, and the village abandoned as would have been done before the coming of an invader too powerful to resist. The men were all fully armed, and the women and children were surrounded, and then all started forth at best pace; they kept away a month, and then returned with the same precautions as when leaving, approaching very cautiously with shields

* No. 59, dated 1st May, 1877.

well to the front, and peeping round every corner before a further advance until gradually the whole village was occupied.

When they fairly satisfied themselves that no one but the Kuki had been ill, they were rather ashamed of running away; but it was not until some time after when they saw him going about, very little the worse in appearance, that the idea that he had been burnt alive was abandoned. Before, nothing would persuade them this had not been done, it being looked upon as merely a wise precautionary measure for which we deserved credit.

Their fears are apparently still strong, but they take the more sensible precaution of submitting to the process of vaccination. During the five years ending with 1902-03, seventy-six per mille of the population were successfully vaccinated every year; a proportion that was higher than that reported from any district in the Province except the Garo Hills. Nothing could well exceed the dirt of the Naga villages and houses, and were it not for the very sanitary character of the site, they could hardly fail to become veritable hot-beds of disease. But they are generally built on the very summits of the hills, and there are no fruit trees or bamboo jungle to deprive them of the purifying influences of the sun and air. The people, too, have the sense to wrap up warmly in the cold weather, a sensible precaution which saves them no doubt from many chills. In the absence of all statistics it is difficult to say whether the death rate is high or not. The Nagas do not increase rapidly in numbers, but this may possibly be due more to a low birth-rate than to a high mortality.

Venereal diseases are not very prevalent amongst the Angamis, but are unfortunately common in the Ao country, and their dissemination is facilitated by the

customs of the people. In 1903, there were more cases of primary and secondary syphilis treated at the Kohima and Mokokchung dispensaries than at any other two dispensaries in the Province. In 1904 the proportion of the population treated in the district dispensaries for syphilis was ten times greater than the proportion in the Province as a whole.

APPENDIX A.—Flora.

The following account of the flora of the Naga Hills has been received from the Superintendent of the Royal Botanical Gardens, Calcutta:—

“The Flora of the Naga Hills closely resembles that of Sikkim up to the same altitude. Below 2,000 feet the low-level jungle consists mostly of plants belonging to such genera as *Pterospermum*, *Columbia*, *Gynandropsis*, *Clansena*, *Erythralium*, *Lepionurus*, *Cardiopteris*, *Lophopetalum*, *Vitis*, *Leea*, *Uraria*, *Alysicarpus*, *Desmodium*, *Pac*, *Dalbergia*, *Bauhinia*, *Sonerila*, *Ammannia*, *Modecca*, *Trichosanthes*, *Momordica*, *Cucumis*, *Melothria*, *Tpladiantha*, *Ggnostemma*, *Begonia*, *Aralia*, *Brassidopsis*, *Heydyotis*, *Polyura*, *Psychotria*, *Paederia*, *Ardisia*, *Pentasacine*, *Cynanchum*, *Mitreola*, *Argyrea*, *Porana*, *Solanum*, *Lindenbergia*, *Lysionotus*, *Didymocarpus*, *Stauranthera*, *Thunbergia*, *Barleria*, *Eranthemum*, *Orthosiphon*, *Chloranthus*, *Hedychiium*, *Hitchenia*, *Zingiber*, *Tacca*, *Dracaena*, *Commelinaceæ*, *Adiantum*, *Pteris*, *Nephrodium*, *Aerostichum*. The slopes from 2,000 feet to about 5,000 feet are chiefly under rice cultivation. From 5,000 feet to about 8,000 feet the vegetation is composed for the most part of plants belonging to the genera, *Clematis*, *Thalictrum*, *Michelia*, *Stephania*, *Berberis*, *Viola*, *Polygala*, *Cuenbalus*, *Hypericum*, *Sauruja*, *Eurya*, *Schima*, *Geranium*, *Toddalia*, *Euonymus*, *Gonania*, *Acer*, *Prunus*, *Spiraea*, *Rubus*, *Pyrus*, *Photinia*, *Sedum*, *Circaea*, *Passiflora*, *Hydrocotyle*, *Sanicula*, *Bupleurum*, *Pimpinella*, *Heptapleurum*, *Viburnum*, *Ophiorrhiza*, *Anaphalis*, *Senecio*, *Cuicus*, *Lactuca*, *Campanula*, *Vaccinium*, *Lysimachia*, *Crawfrudia*, *Swertia*, *Scrophularia*, *Pedicularis*, *Elsholtzia*, *Polygonum*, *Litsaea*, *Lindera*, *Pilea*, *Elatostemma*, *Betula*, *Abrus*, *Quercus*, *Pinus*, *Smilax*, *Carex*, *Arundo*, *Arundinella*, *Brachypodium*, *Hymenophyllum*, *Davallia*, *Pteris*, *Aspidium*, *Polypodium*, *Osmunda*, *Equisetum*. Above 8,000 feet occur such plants as *Aconitum*, *Skimmia*, *Ilex*, *Acer*, *Spiraea*, *Rubus*, *Cotoneaster*, *Sedum*, *Epilobium*, *Vicatia*, *Pimpinella*, *Gamblea*, *Senecio*, *Ainsliaea*, *Cyananthus*, *Vaccinium*, *Gaultheria*, *Rhododendron*, *Pedicularis*, *Quercus*, *Cephalotaxus*, *Juncus*, *Deycuazia*, *Lomaria*, *Polypodium*.”

For further information see (1) Mr. C. B. Clarke's Botanical observations made in a journey to the Naga Hills, Journal of the Linnean Society, Volume XXII, page 128, and (2) a paper on the Plants of Kohima and Manipur by the same author in the Journal of the Linnean Society, Volume XXV, page 1.

TABLE I.

Rainfall.

The number of years for which the average has been calculated is shewn below the name of each station.

PART II.
MANIPUR.

CONTENTS.

CHAPTER I.

PHYSICAL ASPECTS.

Area and boundaries—Mountain system—Rivers—Lakes and jhils—
General appearance of the valley—Climate and rainfall—Earth-
quakes—Wild animals. Pages 1—10.

CHAPTER II.

HISTORY.

Early traditions—Reign of Panheiba from 1714 to 1754—Three Rajas in
ten years—Jaie Singh reigns intermittently—Marjit and his brothers
—Burmese occupation—Continuous anarchy—Gambhir Singh—Nur
Singh Regent and then Raja—Chandra Kirti Singh—Thirteen raids
and two revolutions in 32 years—Sur Chandra Singh—Murder of the
Chief Commissioner in 1891 and subsequent pacification of State—
History of Political Agency—Unsatisfactory position of Agent—
Turbulence of hill tribes in 1891. Pages 11—41.

CHAPTER III.

POPULATION.

Area and density—Imphal town—Villages—Growth of population—Birth-
place—Sex—Marriage customs—Infirmities—Language—Caste—Phy-
sical appearance and moral characteristics—Hill tribes—Religion
—Occupations—Games and amusements—Sradhs. Pages 42—71.

CHAPTER IV.

AGRICULTURE AND FORESTS.

Rice—Irrigation and floods—Sugarcane—Fibres—Other crops—Jhum and
terraced cultivation—Live stock—Farm implements—Forests.
Pages 72—85.

CHAPTER V.

INDUSTRIES.

Weaving—Silk—Working in metals—Leather work—Mats—Carpen-
tering—Dyes—Salt—Iron—Limestone—Copper. Pages 86—95.

CHAPTER VI.

ECONOMIC CONDITION OF THE PEOPLE—COMMUNICATIONS AND TRADE.

Rents and wages—Prices—Famine—Food—Houses—Furniture—Dress—
Economic condition of people—Communications—Post and Tele-
graphs—Commerce and trade—Development of cart traffic.
Pages 96—113.

CHAPTER VII.

GENERAL ADMINISTRATION.

Land revenue—Lalup—Revenue administration since 1891—House tax—
Fisheries—Other sources of revenue—Criminal and civil justice—
Punishments—Police and jails—Education—Medical aspects.
Pages 114—132.

CHAPTER I.

PHYSICAL ASPECTS.

Area and boundaries—Mountain system—Rivers—Lakes and Jhils—
General appearance of the valley—Climate and rainfall—Earth-
quakes—Wild animals.

THE Native State of Manipur is situated between ^{Area and boundaries.} 28° 50' and 25° 41' N. and 93° 2' and 94° 47' E. and covers an area of 8,456 square miles. On the north it is bounded by the British district of the Naga Hills, on the west by Cachar, on the south by the Lushai Hills and Burma, and on the east by Burma.

The greater part of the State consists of ranges of hills whose general trend is north and south. Towards the east the direction of the upthrust is not so well defined, and the country lying between Manipur and the Kubo Valley consists of a tumbled mass of hills, with a general tendency to run east and west. In the centre of the State is the valley of Manipur, which is about 80 miles in length and 20 in breadth. Lines of low hills, which crop up here and there above the alluvium, suggest that the formation of the valley was originally much the same as that of the surrounding hills, and

that it consisted of two or more chains of mountains running north and south, with deep valleys in between. These ranges were, however, considerably lower than those that now surround them. It has generally been thought by most observers that the Manipur Valley was originally a lake. This theory was, however, rejected by Mr. R. D. Oldham of the Geological Survey Department, who pointed out that, had it been correct, there would have been the remains of terraces formed by the cutting down of the outlet.*

Mountain
system.

The following list of the hill ranges of Manipur is taken from the *Gazetteer* by Captain Dun. The ranges on the west are—(1) Nunjaibong; (2) Kalanaga; (3) Chakka-Nungba; (4) Kaupum (really only a spur from the Laimatol); (5) Kopru-Laimatol. On the north—(1) The Kunho spurs; (2) Thumion-Mayang-Khang; (3) Laisom; (4) Sirohifara. On the east—(1) Sarameiti or Ching-angauga; (2) Somra; (3) Kassom; (4) Nupitel or Mapethe; (5) Yomadung. On the south—(1) Haobi.

The greatest altitude is attained in the extreme north, where Mao thana is overhung by a peak nearly 10,000 feet above the level of the sea. The hills run, as a rule, in irregular serrated ridges, rising here and there into peaks; but west of the valley assume a more open and rolling character. Between Cachar and Manipur, they are covered with dense evergreen forests and bamboo jungle. In the country to the west pine trees are common; but round the valley itself, and along

* Memoirs of the Geological Survey of India, Vol. XIX, Part 4, p. 21.

the Kohima road there is comparatively little tree growth, and the sides of the hills are, for the most part, covered with grass. The ranges are, as a rule, composed of soft grey shale, which is very liable to slip when exposed to the action of the rain and air. The slope is fairly easy till near the summit, which is often rocky and precipitous.

The rivers of the valley take their rise in the hills **Rivers.** towards the north. On the east is the Thobal, which rises in the hills not far from Ukrul. West of the Thobal is the Iril, which rises about fifteen miles east of Maram, and, after skirting the town of Imphal, falls, like the Thobal, into the Imphal river. Through the capital itself flow the Imphal and the Nambol. The last-named river falls into the Loktak, from which it emerges under the name of Kortak. This stream eventually joins the Imphal, and another river called Nambol, which rises near Kangjupkul and flows to the west of Imphal and the Loktak. Their united waters, which are known as the Achauba, Imphal, or Manipur river, finally fall into the Kendat and thus into the Chindwin. In the hills these rivers are bright and sparkling streams, flowing along over their rocky beds, but in the valley they assume the disagreeable characteristics often found in the rivers that traverse an alluvial plain. In the cold weather they are shallow muddy streams, creeping along at the bottom of the deep channels which they have cut through the alluvium, but in times of flood they rise to a considerable height and sometimes overtop their banks. In the dry season they are only navigable by canoes, and, though in the rains there is a

considerable depth of water, country boats of a larger size are quite unknown. Attempts were made to introduce them after 1891, but they were not received with favour, and the Manipuris evidently find their small canoes sufficient for the short journeys they perform.

Hill rivers.

In the eastern hills there are numerous small streams which drain into the Yu and thence into the Chindwin. They flow through deep valleys, and are liable to sudden floods which render them difficult to cross, but only one of them, the Maglang, has any depth of water in the winter. The principal rivers in the western hills are the Barak and its tributary the Irang. The Barak rises about ten miles east of Mao thana, and flows a westerly course as far as Kairong, where it crosses the Manipur-Kohima cart-road. Here it takes a bend towards the north, and then turns westward, till it reaches the north-west corner of the State. The river then curves away towards the south, and flows the whole way to Tipaimukh, which till lately was the tri-junction point of Manipur, Cachar and the Lushai Hills, along the eastern side of the last main range of hills which separates Cachar from Manipur. At Tipaimukh the Barak turns sharply to the north, and, as far as Jirighat, flows almost parallel with, though in the opposite direction to, the section of the river that lies between Kalanaga and Tipaimukh. In this portion of its course it forms the boundary between Cachar and Manipur, but at Jirighat it turns again to the west, and, after a tortuous course through the districts of Cachar and Sylhet, falls into the old bed of the Brahmaputra near Bhairab bazar. The principal

tributary of the Barak is the Irang, which rises a little to the west of Kairong, and falls into it about 20 miles north of Tipaimukh. Two other rivers of some importance, crossed by the traveller from Cachar to Manipur, are the Jiri, which for a considerable distance forms the western boundary of the State, and the Makru. None of the other streams that flow along the valleys and carry off the drainage of the slopes on either side are of sufficient size to merit special mention. In the dry season the hill rivers consist, as a rule, of still deep pools linked together by shallow rocky reaches. In the rains they are liable to sudden freshets, and, though there is no very great depth of water in the river, the current is extremely swift and strong. The Barak at Kairong only contains a few inches of water in the cold weather, but, during the rains, carts used sometimes to be detained for several days till the subsidence of the flood.

The Loktak is the largest sheet of water in the Province of Assam, and is said to be eight miles long and five miles wide at the broadest part.* It is a broad, shallow, sheet of water, and is just such a pool as is left in a saucer-like depression when a marsh dries up. Viewed from above, the appearance of the Loktak is distinctly tame, and there is nothing romantic or picturesque in its surroundings. Ordinary water meadows, destitute alike of reeds and trees, gradually merge into a shallow

The Loktak
Lake.

* The size of the Loktak varies considerably according to the season of the year, and the lake is said to be gradually shrinking. The absence of any very reliable maps of Manipur renders it impossible to give its dimensions with accuracy.

mere. On the western side there are the remains of a row of hills, whose bases have evidently been submerged beneath the alluvium, and whose summits now form steep and precipitous islands. The largest of these is called Tanga, and is a place to which criminals used occasionally to be deported in the days of native rule. Here and there on the broad surface of the lake are floating islets, formed from the matted roots of aquatic plants. Some of the larger ones are used as camping places by the fisher folk, who build their huts there, though the island rocks at each step and the water oozes up in each footprint. But, like the margin of the lake, they are destitute of any growth of reeds, and this absence of anything to break the even level of the view deprives the Loktak of any claim to beauty.

Other Jhils.

Dotted about the valley are numerous *jhils* which only differ from the Loktak in point of size and depth. Many of them, in fact, dry up completely in the winter time, or only contain a few pools in the lowest levels. The Lumphel and Tayel *jhils* near Imphal are valuable as grazing grounds. The Waithou Shorien, the Waithou Phoomnaw, the Ekope, Kajipat, and Poomlen *jhils* are sold for considerable sums as fisheries. These, however, are but a few of the most important marshes in the valley, and, during the rainy season, there are probably between sixty and seventy sheets of water, some small, some large, but all alike possessed of the prevailing characteristics.

General appearance of the valley.

The traveller who enters Manipur by the Cachar road obtains a magnificent view of the valley from the summit of the Laimatol hill. For several days his path

has lain across range after range of mountains, covered with forest so dense that it is seldom that he can see as much as a quarter of a mile before him. Suddenly all is changed. The eastern face of the hill, as it slopes before him to the valley, is covered with short grass, and rolling downs take the place of the dense tropical forest that lies concealed on the western side of the ridge. The valley lies before him like a map. At the northern end, some twenty miles away, are the dark-green groves that conceal the town of Imphal. Elsewhere are level rice fields, and land covered with grass, about which are dotted the clumps of trees that mark the villages. These villages are much more scattered than they are in the densely populated portions of Assam. They do not stretch in one long continuous line, but stand out here and there, clear and well defined, and there is many a square mile of land without a trace of human habitation. Low ridges of hills stand up above the alluvium, and sheets of water gleam in the shallow depressions on the plain. To the south, the Loktak sparkles in the sun, and on every side the view is bounded by hills. But, unlike the mountains that shut in the two great valleys of Assam, they are almost destitute of trees, and nowhere in the valley is there that rank growth of vegetation which is so distinguishing a characteristic of the British Province.

Lying as it does at an elevation of 2,600 feet above the level of the sea, the climate of the valley is generally cool and pleasant. No records of temperature are kept, but it is said that at the hottest season of the year the thermometer in the residency seldom rises above 83°

Climate and
Rainfall.

Fahrenheit.* The average rainfall at Imphal is about 70 inches in the year, but it is much more variable than is usual in Assam. In 1896-97, it was 57 inches, while in 1899-1900, it was over 100. The rainfall in the same year at Ukrul, about 85 miles north-east of Imphal and about 6,000 feet above the level of the sea, was only 68 inches. About half the rain falls in the three months June to August, and the spring rains are not so heavy as in many places in Assam. The average rainfall recorded in each month will be found in Table I.

The prevailing winds are from the south and west. Storms and destructive cyclones are far from common, but, at Moirang, a special puja is performed each year with the object of warding off calamities of this kind. The village at this time does a regular Naga *ghenna*, and for five days no one is allowed to enter or leave its precincts.

Earth-
quakes.

On January 10th, 1869, a severe shock of earthquake was felt at Manipur. The Raja's house, which was built of brick, collapsed, killing four persons and wounding several more. The upper story of the residency subsided, the treasury was levelled with the ground, and numerous other buildings wrecked. The ground opened and sand and mud were spouted forth, and the beds of the rivers were choked by the *debris* which fell into them.† The only persons in the State, who were known to have been killed by the earthquake, were the four who were buried in the ruins of the Raja's palace. The

* Colonel Johnstone reports that the highest and lowest shade temperature recorded by him were 92° and 30°.

† Memoirs of the Geological Survey of India, Vol. XIX. Part I, p. 20

great earthquake of June 12th, 1897, was distinctly felt. The ground rocked, trees waved to and fro as though exposed to a storm, and the houses swayed. The actual damage done was, however, insignificant, and, in the opinion of the Political Agent, the shock was not strong enough to injure any well-built building.

The larger kinds of fauna are not nearly so ^{Wild} numerous as in the Brahmaputra Valley, in spite of ^{animals.} the fact that a great portion of the State is very sparsely peopled. Elephants are found, but are by no means common. The bison or mithun (*bos gaurus*) is occasionally seen, but wild buffalo are quite unknown. Of deer there are several varieties: the sambar (*cervus unicolor*), the barasingha (*cervus duvauceli*), the hog deer, (*cervus porcinus*), the barking deer (*cervulus muntjac*), and the Manipuri deer or sangnai (*cervus eldi*), which is found not only in Manipur but in Burma, the Malay Peninsula, Cambodia, and Hainan. Stags of the latter variety stand about 45 inches at the shoulder, and are fawn-coloured in summer and of a darker hue in winter; does are a little smaller and of a fairer colour. The horns have an extremely long curved brow-antler, joining the beam in such a manner that the two form one continuous curve at right angles to the pedicel. The beam is unbranched for a considerable distance, generally more than half the length, and curved backwards, then outwards, and lastly forwards; towards the end it bears a number of small points. These deer are no longer common, and are generally to be found in swampy ground.

Leopards are fairly common, and tigers are

occasionally killed. Two varieties of black bear are found in the hills, and in the tops of the highest mountains the serow is occasionally to be seen. Other animals include wild cats, wild pigs, which are fairly common, otters, monkeys, and rats. Rats occasionally do much damage in the hills by consuming all the grain. They are specially voracious in the south, where Manipur adjoins the Lushai country, and in the Lushai Hills they once produced an actual famine. Wild duck of various kinds, and wild geese are extraordinarily plentiful, and the surface of the Loktak is often covered with these birds. Hume's pheasant (*phasianus humiae*) is found in Manipur, in addition to the peacock pheasant (*polyplectrum*) and the ordinary Kalij pheasant. There is excellent snipe shooting, and partridges, wood cock, and jungle fowl (*gallus ferrugineus*) are also to be had. Cobras and other poisonous snakes are rare, but harmless snakes are not uncommon. Large python are found in the moist warm valleys that separate the ranges that lie between Cachar and Manipur.

CHAPTER II.

HISTORY.

Early traditions—Reign of Panheiba from 1714 to 1754—Three Rajas in ten years—Jaie Singh reigns intermittently—Marjit and his brothers—Burmese occupation—Continuous anarchy—Gambhir Singh—Nur Singh Regent and then Raja—Chandra Kirti Singh—Thirteen raids and two revolutions in 32 years—Sur Chandra Singh—Murder of the Chief Commissioner in 1891 and subsequent pacification of State—History of Political Agency—Unsatisfactory position of Agent—Turbulence of hill tribes in 1891

THE origin of the Manipuris, as of the other hill tribes on the frontier, must always be a matter of uncertainty. McCulloch reports that, according to the most credible traditions, the valley was originally occupied by several tribes, the principal of which were named, Koomal, Looang, Moirang, and Meithei, all of whom came from different quarters of the compass. The Koomal are said to have been originally the most powerful and after them the Moirang; but ultimately the Meithei subdued them all and formed them into a single people. Tradition says that the Moirangs came from the south, the country of the Kukis and the Chins; the Koomal from the east, where the Tankuls now are found;

Origin of the Manipuris.

and the Meithei and Looang from the hills to the north-west, which are at present occupied by the Kapuis and the Mao Maram Nagas.* McCulloch, with whom Brown agrees, is of opinion that the Manipuris are descended from the tribes inhabiting the hills that surround the valley, and bases his opinion on their own traditions, on philological affinities, and on the fact that the ceremony of ascending the throne is performed in Naga dress, while the *Zimchaw* or 'great house,' the original residence of the hill chief, is built in Naga fashion. The Manipuris, it should be said, deny that the costume in question is in any way peculiar to the Nagas, and a small section of them lay claim to a western and Hindu descent.

Early traditions of Manipur.

According to McCulloch (p. 5) the records of Manipur contain a long list of chiefs, a list of names and of very little more. Pemberton reports that Manipur was visited by Samlongpha, brother of the king of Pong, towards the close of the eighth century A.D.† He had been on a raiding expedition through Cachar and Tippera, and descended into the valley near Moirang, a village on the western shore of the Loktak lake. He ordered the people of Moirang to make a yearly offering to the local gods, and visited the Meitheis, who were not assessed to tribute, but were ordered to dress more decently and to chew pan in place of the pieces of dried fish

* Account of the Valley of Manipur and of the Hill Tribes, by Major McCulloch, Political Agent at Manipur, p. 4.

† Report on the North-East Frontier, page 109. According to Pemberton this Samlongpha was the first Ahom or Shan chief to invade Assam. This invasion is, however, generally assigned to the 13th century, A.D.

they had formerly affected. For several centuries after the visit of this Shan prince nothing of interest is recorded in the annals of Manipur. The Meithei tribe increased in dignity and importance, and in 1475, the King of Pong proposed to marry a daughter of the Meithei chief. On her way to Pong she was carried off by the Raja of Khumbat, but he was promptly attacked and conquered by the combined forces of Pong and Manipur. His territories were made over to the Meithei chief, and the valley was visited by the Pong king who directed that the old form of Naga house should be abandoned and the so-called "long lived house" should be adopted in its stead. He also presented the Raja with a golden *pandhan*, a silver mounted dao, and a litter, which, with a sacred spear, were for many years the insignia of royalty. The last of these articles, the golden *pandhan*, disappeared in 1850, when it was carried off by Raja Debendro Singh.

The modern history of Manipur may be said to date from 1714, when Panheiba, or Gharib Nawaz, accidentally shot his adopted father and thereby cleared his way to the throne. According to one account, Panheiba was a Naga boy who had been adopted by the Raja. Others say that he was the Raja's son by one of his inferior wives. It was the custom at that time to kill all sons born to the Raja by any of his minor wives. This in itself is a sufficiently unpleasant practice, but a perusal of the history of Manipur shows that amongst such a cruel and treacherous people there was much to be said in favour of the custom. Panheiba's mother succeeded in concealing her young infant, and smuggled him away into the hills. The principal Rani was not

Gharib
Nawaz 1714
—1754, A.D.

blessed with a son, and the Raja having heard of the existence of Panheiba adopted him and declared him to be his heir.

Gharib Nawaz occupied the throne for forty years, and under his guidance Manipur appears to have attained to a position of considerable power and dignity. Several expeditions were led across the frontier into Burma, and it is said that a Burmese Raja was established on the throne at Ava who acknowledged the supremacy of Manipur. But the event which was fraught with the most fateful consequences for the people was the introduction, or, as some will have it, the revival of Hinduism. Another innovation was the rescission of the law prescribing the execution of the Raja's surplus sons, a liberal measure from which Gharib Nawaz was himself the first to suffer. In 1754, he was in the act of leading an expedition into Burma, accompanied by his eldest son Sham Shae, when on the banks of the Ningthi, about five days' journey from Manipur, he and his eldest son were surprised and killed by a force sent by Jeet Shae,* one of his younger sons, who had cast a covetous eye upon the throne.

This was but the beginning of the dreary tale of treason, rebellion, and intrigue which makes up the modern history of Manipur.† Like the priest of Aricia, most of the rulers of the State have remained seated on the *gadi*, only

Three Rajas
between
1754 and
1764.

* Dun in his Gazetteer calls Jeet Shae, Oogut Shah or Kakeelal thaba.

† It is thus described by Mackenzie in his North-East Frontier, p. 149. "The early history of Manipur was barbarous in the extreme. It was not only marked by constant raids of the Manipuris into Burma, and of the Burmese into Manipur, but by internal wars of the most savage and revolting type, in which sons murdered fathers and brothers murdered brothers without a single trait of heroism to relieve the dark scene of blood and treachery.

so long as they have been able to repel the perpetual assaults that have been made upon it by other aspirants. This in itself was bad enough, but the fact that the other aspirants were generally brothers of the reigning chief was an additional aggravation of the original offence of treason. Jeet Shae only reigned for five years, and was then driven forth by his brother Burut Shae, to die an exile in the Jaintia Hills.

Burut Shae only lived for two years after the expulsion of his predecessor, and on his death, the succession devolved on Guru Sham, the eldest son of Sham Shae and the grandson of Gharib Nawaz. This man was a cripple, and, so sensible was he of the disabilities caused by this infirmity, that he invited his brother Jaie Singh or Bhaggo Chandra to assist him in the administration of the country.

Guru Sham died in 1764, and Manipur then passed through a very dark period of its history. A year before the death of the crippled chief, the Burmese defeated the Manipuri forces and advanced into the valley. Though they only occupied it for a few days they were guilty of terrible atrocities, and carried away with them a great quantity of slaves. The Manipuris, feeling themselves too weak to oppose their national enemy unassisted, made overtures to the British. A small force under Captain Verelst was sent to their assistance in 1768, but the difficulties of transport proved insuperable, and it got no further than Cachar.

About 1765, the Burmese were again upon the move. The Manipuris met them at Tammu in the Kubo Valley but were defeated; the enemy entered the valley, and Jaie

1764-1798.
Jaie Singh
Raja, but
driven from
the State
three times.

Singh was compelled to fly to Cachar and from thence into Assam. The Burmese placed a prince called Kelemba on the throne, but it was not for long that he enjoyed the sweets of power. In 1768, Jaie Singh returned from Assam, Kelemba fled to Burma, and, when in the following year he returned in the hope of being able to regain the *gadi*, he was killed by two Manipuris who gained access to his person by professing to be bearers of a message from Jaie Singh. But, though he died, he did not die unhavenged. In the following year his brothers entered the valley, and Jaie Singh was compelled to take refuge in Cachar. The miserable little State was then given up to anarchy and confusion, one pretender following another in quick succession on the throne, some of them being Manipuris and some Burmese.

After a time a Manipuri prince, by name Eremba, succeeded in introducing some form of settled government and some degree of order, and in the third year of his reign actually repulsed the Burmese who were engaged in one of their periodical invasions of the valley. On hearing of this most unusual success, Jaie Singh once more returned and took up the reins of Government which Eremba resigned with a humility which seems strangely unnatural in a Manipuri prince. In the following year the Burmese again invaded Manipur, Jaie Singh again sought safety in flight, and the State was once more handed over to all the miseries of misrule and anarchy.

After a time Jaie Singh once more succeeded in returning and establishing himself upon the throne. But he was now becoming an old man, and such dignity as still attached to the position of Raja of this petty State was

hardly sufficient to compensate for the terrible uncertainties of the position. Three times had he been driven from his throne, and in his declining years he seems to have longed for a less strenuous and eventful life. In 1798, he abdicated in favour of his eldest son Rabino Chandra, and went on a pilgrimage to Nadia, where he presently expired.

Rabino reigned for three years and then fell a victim to Gharib Nawaz's mistaken liberality in exempting the brothers of the heir-apparent from assassination. One afternoon he was peacefully engaged in looking on at a hockey match when he was murdered by the orders of one of his half-brothers Madu Chandra.

1798-1804.
Two Rajas
in succession
killed by
their half-
brothers.

Madu Chandra did not remain long in possession of his ill-gotten gains. He was driven from the State by one of his brothers, Charjit Singh, and fled as usual to Cachar. Here he married the Raja's daughter and was supplied with men and arms, but his attempt to regain the *gadi* proved unsuccessful and he was killed by Charjit's troops.

It was too much to suppose that Charjit could remain for any length of time in unmolested possession of the throne, and Madu Chandra's place was quickly filled by another brother, Marjit Singh. Several engagements took place, but fortune did not favour the pretender, and he was compelled like his predecessors to take refuge in Cachar. Here he met with far from hospitable treatment. He had taken with him a famous hockey pony which aroused the envy of Gobind Chandra, the brother of the reigning Raja. When his offers to purchase were rejected, the prince seized the pony, relying

ful but after-
wards de-
feated and
driven out.

on the title of *force majeure*, and Marjit retired in dudgeon from the State. He then proceeded by sea to Rangoon, succeeded in obtaining assistance from the Burmese king, and with troops supplied to him by the hereditary enemy of his country, marched into Manipur and drove Charjit from the valley.

Marjit
reigns from
1812-1819.

For seven years Manipur enjoyed a period of tranquility to which for long the people had been unaccustomed. Marjit avenged himself for the loss of his pony by invading Cachar and dividing most of that fertile district between his two brothers Charjit, to whom he had now been reconciled, and Gambhir Singh.* But in 1819, Marjit somewhat foolishly attempted to assert his independence of the Burmese, and when called upon to attend the court as a feudatory of the king, declined to do so. It was not to be supposed that the Burmese would quietly swallow the affront that had been put upon them. An army marched into Manipur, Marjit was compelled to fly, and the Burmese remained in occupation of the country.

Manipur in
hands of
Burmese
from 1819-
1824.

Marjit retired according to the custom of his predecessors to Cachar, which at that time was in the practical occupation of his brothers Charjit and Gambhir Singh, and the Burmese set up two puppet princes as the nominal rulers of Manipur. In 1823, the Burmese advanced across the hills into Cachar. They were now operating at a considerable distance from their base, and they were defeated and driven back by Gambhir Singh, who had taken up a strong position in the Surma Valley.

* According to Pemberton (p. 45), Charjit was already a personage in Cachar and assisted Gobind Chand in getting rid of Marjit.

In the following year they returned again, but war had by this time been declared between the British and the Burmese, and the latter were completely routed by the Manipuris supported by the British troops. The line of their retreat lay through the most difficult and inhospitable country, and in their attempt to extricate their army they suffered serious loss. On reaching the valley of Manipur, they took up a position near Ningail. From this they were easily ejected by the Manipuris, and they then withdrew to their own country without any further attempt to retain the territory they had occupied for upwards of five years.

It is said that on the final withdrawal of the Burmese the adult male population of the valley of Manipur did not exceed 3,000 souls.* At first sight this would seem to be an extraordinarily low estimate, but great numbers of the people had been killed in action or carried into captivity, or had fled for safety to the Surma Valley. In the short space of sixty years, a period which is easily included in the memories of a single individual, the State had been invaded no less than four times by the Burmese, and for the last five years of this period they had remained in occupation of the country. No less than six times was the reigning Raja driven from the *gadi*, and this takes no account of the numerous puppet princes, who followed one another in quick succession during the two distinct periods in which the country was reduced to a hopeless state of anarchy. Twice had the reigning prince been murdered, and on

both occasions he had been murdered by the order of his own brother.

Gambhir
Singh, 1825-
1834.

After the expulsion of the Burmese it was considered that both Charjit and Marjit were too old to undertake so onerous a task as the management of such a State as Manipur, and the sceptre accordingly devolved upon their younger brother Gambhir Singh. Five hundred muskets had already been supplied by the British Government to the Manipuris to assist them in recovering their country, and this valuable present was shortly afterwards supplemented by the gift of 1,500 more, a gift which added enormously to their value as a fighting force. Gambhir Singh then proceeded to advance against the Burmese, and succeeded in occupying the Kubo Valley which he held till 1824. It was in that year restored to Burma, at the request of the British Government who compensated Manipur for this loss of territory by an annual payment of the sum of Rs. 6,000 a payment which continues to be made at the present day, the actual amount now given being Rs. 6,270.

Regency of
Nur Singh.

In 1834, Gambhir Singh died leaving an infant son, and Nur Singh, the *senapati* or General-in-Chief, placed the baby on the *gadi* and assumed himself the office and dignity of regent. Nur Singh was himself a great-grandson of Gharib Nawaz, and thus stood in the same relation to the founder of the dynasty as Gambhir Singh, Charjit, and Marjit. They, however, traced their descent through the eldest son Sham Shae, while Nur Singh was a grandson of the eleventh son Dhorshai. It was not, however, to be supposed that the other descendants

of Gharib Nawaz would acquiesce in the accession of a baby to the throne without a struggle.

In 1838, Turring Romba, the eldest son of Raja Robino Chandra, who was the elder brother of Gambhir Singh and had been murdered in 1801, invaded the valley with 800 men. But the regent was not the man to be taken unawares. Turring was killed, and most of his followers either killed or taken prisoner. Within the next few years two more attempts were made to drive the baby from his throne. One of these raids was led by two of Marjit's sons, the other, by two sons of Charjit Singh. Nur Singh was still too much for the raiders, and the people showed no desire for a change of rulers. All of these four swash bucklers were killed, and their scanty band of followers either slain or taken prisoner.

In 1844, Nur Singh was attacked by a traitor from within the camp. As the regent was returning from an evening visit to the temple, he was assailed by an assassin, who inflicted a severe, but luckily not mortal wound. The conspirators were arrested, and the Rani fled to Cachar with her infant son. Here she gave out that she had fled under the impression that Nur Singh was dead, and his government overthrown; but it was more generally believed that she had been the real instigator of the plot, and that on its failure she had been compelled to seek safety in flight.

This at any rate was the view to which Nur Singh inclined, and without further ado he stepped into the place which had been vacated by the action of the Queen mother. He did not live to enjoy it long, and

Nur Singh
assumes
sovereignty,
1844-1850.

in 1850, died of cholera. Shortly before his death he defeated an expedition led by Milai Romba and his brother, who were descendants of Raja Churai Romba and had designs upon the throne. Their followers were routed, and one of the brothers killed in action, the other captured and put to death.

Debendra
Singh.

Nur Singh was succeeded by his brother Debendra Singh, who enjoyed a troubled reign of three months' duration. The three sons of Nur Singh at once retired to Cachar, and brought back Chandra Kirti Singh, the son of Gambhir Singh, for whom Nur Singh had acted as regent for ten years. The people made no concealment of their preference for the son of their old Raja, and Debendra Singh was compelled to retire to the usual refuge of disappointed Manipuri princes.

Chandra
Kirti Singh,
1850.

The new Raja then made the eldest son of Nur Singh, *jubraj* or heir-apparent, and another son *senapati* or commander of the forces; but within a fortnight another revolution was in progress. The three sons of Nur Singh, who had turned out Debendra Singh to put Chandra Kirti Singh in, within a fortnight combined with a younger brother of Debendra Singh to overthrow the man they had themselves conspired to place upon the *gadi*. They were, however, defeated, and as usual, fled to Cachar. Debendra Singh then made two attempts to recover his lost throne, but neither of them were successful. In 1851, his son combined with two of Nur Singh's sons to try and wrest the sceptre from the Raja, but the conspirators were defeated and Debendra's son was killed. Hope springs, however, eternal in the Manipuri breast, and in the following year the sons of

two other Manipuri Rajas, Madu Chandra and Marjit, made an attempt, which was as usual unsuccessful. For seven years there was a cessation of these raids, but in 1859, one Mypak, a descendant from the original Gharib Nawaz, tried his luck and failed. In 1862, he made a second attempt, equally unsuccessful, and was wounded and made prisoner. In 1864, Kanai Singh, Marjit's son, made a second bid for the crown, but again without success, and in 1866, Gokul Singh, a younger son of Debendra Singh, headed a raid from Cachar. On this occasion an incident occurred which was quite in keeping with the usual proceedings of this little State; proceedings which would seem almost too grotesquely foolish even for burlesque, if the results were not so tragic for the principal performers in the drama. The Raja's men moved out to meet the raiders, and towards evening entrenched themselves in the position they had taken up. In the meanwhile a party of sepoys, who had been sent from Cachar in pursuit of Gokul Singh, came up, and, finding a number of Manipuris holding a position, jumped to the conclusion that these were the raiders led by Gokul Singh. The same idea occurred to the Manipuri troops, who were not aware that any sepoys were coming from Cachar. A smart action ensued, and, while the two parties sent to capture Gokul Singh were busily engaged in pounding one another, Gokul Singh himself slipped away unobserved.

It would be difficult to find any parallel for such a State as Manipur. Reference has been already made to the terrible state of anarchy that prevailed at the end of the eighteenth and the beginning of the nineteenth century.

Thirteen
raids and
two attempt-
ed revolu-
tions in 32
years.

Much of the trouble of that troublous time was due to the treachery of the Manipuri princes, a treachery which did not even spare a brother or a father. But much was due to the Burmese, and for their invasions the Manipuris were only partially responsible; though, had they not been so hopelessly divided, they would probably have succeeded in repelling the attacks that were made upon the valley. But after the appointment of a Political Agent in 1835, they were practically guaranteed against invasion from without, and the troubles that beset them were all of their own making. Even the President of a South American Republic, even a political leader in the Balkan States, would turn with disgust from such a sorry record, such a pitiful tale of political incapacity and intrigue. In the short space of 32 years, between 1834 and 1866, no less than thirteen attempts were made upon the throne by filibustering adventurers from Cachar, and there were no less than two attempts at revolution from within. Except in the case of the one raid which was successful, and which placed Chandra Kirti Singh upon the throne, it can hardly be said that any of the pretenders had the smallest claim to oust the chief who happened to be in possession at the time. Rajas of Manipur have many sons, the right of primogeniture is but imperfectly acknowledged, and any descendant of the ruling house who felt that he had the very smallest prospect of success, did not hesitate to make an attempt upon the *gadi*.

Sur Chandra
Singh, 1886.

In May 1886, Chandra Kirti Singh died and was succeeded by his eldest son Sur Chandra Singh. As usual, attempts were made by other pretenders to drive

him from the throne. Bara Chauba Singh, the eldest son of Nur Singh, headed a rising which nearly proved successful, but was ultimately defeated and compelled to fly. In October 1886, he started from Cachar with a force of 300 men, but was followed by Lieutenant Harris with 100 military police. Bara Chauba took up his position on a small hill about three miles from Imphal, but was defeated without difficulty and surrendered. He and his relatives were deported to Hazaribagh, and those of his followers who were British subjects were sentenced by the Deputy Commissioner of Cachar to various terms of imprisonment for waging war upon a friendly State.

In 1887, two more attempts were made, both of which occurred in the month of September. The first was headed by the *wangkhaираpka*, or chief judicial officer of the State. It was quelled without difficulty by the Manipuri troops; and the leader was shot dead when making a rush upon the Raja's private residence. The second was headed by Jogendra Singh, the son of a man called Chiba, who had been killed when heading a revolt against Nur Singh some 40 years before. The insurgents, about 200 in number, entered the State from Cachar, hotly pursued by a detachment of the military police. They were met by a company of the 44th Gurkha Light Infantry (now 8th Gurkha Rifles) under Lieutenant Row, and Jogendra Singh and 14 of his followers were killed, while 38 were taken prisoner.

The revolution that took place in 1890 was successful, and Sur Chandra Singh was driven from his palace by his two youngest brothers. They were instigated to this act of treachery by the third brother Tekendrajit,

Sur Chandra
Singh ex-
pelled in
1890.

the *senapati* or chief military officer in the State. The deposed Raja took refuge in the residency, and there formally resigned the crown, announcing the fact of his abdication in a letter to the *senapati*, and returning to the palace the silver sword of state. He then withdrew to that home of lost Manipuri causes, Cachar. But as soon as he reached British territory he repudiated his deed of abdication and applied to the Government for assistance in the recovery of the throne.

The arrest of
the *Senapati*
ordered.

Such a proposal did not commend itself to the Government of India. They decided to recognise as Raja the second brother Kula Chandra Dhaja Singh, who, on the flight of Sur Chandra, had proclaimed his accession to the *gadi*; but directed that the turbulent *senapati* who had been the leading spirit in the recent revolution, should be deported from the State. The *senapati* was, however, very popular with the Manipuris, and this was probably the principal cause of the determined opposition offered to his arrest. To carry out these orders the Chief Commissioner, with an escort of 400 sepoys of the 42nd and 44th Gurkha Rifles (now the 6th and 8th) under the command of Lieutenant-Colonel Skene, proceeded to Manipur, and arrived at Imphal on March 22nd. He was received with every show of outward respect, but it was a significant fact that the salute was fired from within the Fort, and that the guns were not as usual brought out to the polo ground. A durbar was announced for noon on the same day, but though Kula Chandra presented himself at the residency, the *senapati* sent his excuses and stated that he was too ill to come. The Chief Commissioner declined to hold a

darbar in the absence of the *senapati*, and, as the Raja was unable to procure his attendance, he was allowed to leave. In the afternoon the Political Agent visited the palace, and informed the Raja that the darbar would be held at 9 A.M. on the following day, March 23rd. The day and the hour came, but neither the Raja nor the *senapati* appeared. An ultimatum was then sent to the palace to the effect that if the *senapati* was not given up without more ado, steps would be taken to have him seized by force. The Political Agent also spent some hours in consultation with the Raja, and endeavoured to induce him to comply with the demands of Government, but without effect.

Shortly before daybreak on March 24th, two parties of men were sent to arrest the *senapati* in his house, which was situated about a quarter of a mile away to the north-east, just outside the strong wall which encircled the precincts of the palace. The first party, under the Command of Lieutenant Brackenbury, approached the house from the east. They appear to have advanced too far, and Lieutenant Brackenbury was mortally wounded. The Manipuris lining the inner wall of the palace then opened fire from the south, and the sepoy, assailed as they were in front and on the flank, fell back. In the meanwhile, the second party under Captain Butcher had succeeded in capturing the house, but the *senapati* had flown, and they merely continued to hold the house and temple, from which they replied to the desultory fire which was opened from the northern wall of the palace enclosure. The western gate of the fort was also seized; but in the afternoon the troops were withdrawn

The fighting
on March
24th.

from these two advanced positions, and concentrated in the residency. The Manipuris had been firing on this building during the afternoon, but the bombardment seems to have done comparatively little damage. In the evening the cease fire was sounded, and the Chief Commissioner attempted to enter into negotiations with the enemy. The correspondence proved abortive, but a message was shortly afterwards received to the effect that the *senapati* was anxious to confer with Mr. Quinton somewhere between the residency and the main gate of the fort. The Chief Commissioner moved away down the road attended or followed by the Political Agent Mr. Grimwood, Lieutenant-Colonel Skene, Lieutenant Simpson, and the Private Secretary, Mr. Cossins. The party advanced further and further down the road, till at last they could dimly be descried through the gathering darkness standing in front of the main gate. Then they disappeared, and were never seen again alive by European eyes. The officers remaining in the residency continued to look down the road striving to catch a glimpse of the returning party. As time went on their anxiety grew apace, but they hesitated to take any decisive action for fear lest they might in some way prejudice the course of the negotiations. About midnight a voice called from the fort in Manipuri, "the Chief Commissioner will not return," and immediately afterwards the Manipuris began once more to open fire upon the residency. It was then decided by the officers who had assumed command in the absence of Colonel Skene, to retire towards Cachar, and no time was lost in giving effect to this decision.

From the accounts given by the natives who were present, it appears that the British officers had a meeting with the *senapati* and other ministers outside the durbar hall. No conclusion had been arrived at, and the officers had started to return, when they were hemmed in by a menacing and angry crowd. The ministers requested them to re-enter the durbar hall, as they were doubtful whether they could restrain the mob, but, as they were going there, Mr. Grimwood received a mortal wound from a spear, and Lieutenant Simpson, who immediately attacked the murderer, was slashed across the head with a dao. It is doubtful whether this attack was premeditated, and whether at the time when the Chief Commissioner was asked to enter the fort, the *senapati* had any treacherous designs upon his life. But by a curious process of reasoning they seem to have considered that, now that one of the five had been murderously assaulted, there was nothing to be gained by abstaining from further treachery. The officers were detained for some time in the durbar hall, an insignificant building of lath and plaister containing several rooms, and resembling a small bungalow more than a hall of audience. They were then brought out bound, thrown on the ground in front of the two dragons that stood before the palace wall, and beheaded in the somewhat barbarous Manipuri fashion.

Outside Imphal a wanton and unprovoked attack was made upon the Superintendent of Telegraphs, Mr. Melville. That unfortunate gentleman left Manipur on March 23rd, and proceeded by easy stages towards Kohima, as he was not aware that there was any

Fate of the
Chief Com-
missioner
and his
companions.

Murder of
Mr. Melville.

risk of disturbances occurring. On March 25th, he was at Maiangkang, about 33 miles from Imphal, and there discovered that he was unable to communicate by wire either with Manipur or Kohima. In the afternoon a party of Manipuris rode into the post, but as there was a Manipuri thana at the place there was nothing in this incident to arouse suspicion. Mr. Melville was a cripple, he was only accompanied by a Eurasian signaller and his servants, and, ignorant as he was of any cause for treachery, he was entirely unprepared. Even so the Manipuris did not venture to attack him openly, but summoned the Nagas from a neighbouring village, and waited for the night to come and hide their movements. They then began shouting and creating a disturbance outside the rest-house, and when the signaller came out to learn the meaning of this demonstration, they fired a volley which stretched him mortally wounded in the verandah. Mr. Melville and his servants escaped out by the back and groped their way up a deep ditch, but lame as he was, the unfortunate gentleman could not go far. The Manipuris burnt the rest-house, but on the following morning, when they came to examine the scene of their brave exploit, they could only discover the corpse of a single Saheb amongst the ashes. A search was instituted without delay, and Mr. Melville was found crouching in the ditch. A Naga promptly ran him through with a spear, and his head was carried off in triumph. In Manipur itself the residency, the post office, and the treasury were destroyed by fire, and the graves in the garden of the residency were desecrated. Cash,

notes, and stamps to the value of more than Rs. 1,85,000 were also looted.

The following account of the steps taken to reduce the rebels is reproduced from the account given in the Report of the Political Agent for 1891-92 :—

Restoration
of order in
Manipur.

“ As soon, however, as the news of the disaster was brought to Kohima by fugitive sepoys and others, the Deputy Commissioner at once marched on Mao, and drove back some Manipuri forces. On the Cachar side troops were moved to the Barak river, and measures were taken to occupy the Manipur capital by British troops. Three columns marched on Manipur from Kohima, Silchar, and Tammu, and arrived before the palace on the morning of the 27th April, to find that the Regent and his brother had taken to flight on the previous evening towards the Tankul Hills, and the leading Manipuris were in hiding in the valley. The palace had been looted by the villagers, the arsenal was destroyed, and the capital completely evacuated. A detachment of Mounted Infantry were quickly sent in pursuit of the fugitives, who were followed up into the Tankul Hills, where further pursuit was abandoned owing to the paths being impassable for ponies. Foot soldiers then took up the chase, but without success; in the meanwhile some Kukis, who were armed by me, headed the princes and compelled them to return to the valley, where one by one they were captured by Manipuris in my employ, the Senapati being the last to be arrested on the 23rd May.

Hearing of the disaster at Manipur, the Jemadar in Command of the Military detachment of 30 sepoys, 43rd Gurkha Rifles, at Langthabal, the British cantonment three miles to the south of the capital, withdrew his detachment in good order to Tammu. Here he met the gallant Lieutenant (now Major) Grant, who, on hearing the news, at once marched on Manipur, taking with him the Jemadar's detachment, in addition to 50 men of his own regiment, the 12th Regiment (2nd Burma Battalion), Madras Infantry. At Thobal, 14 miles from Manipur, Lieutenant Grant's force was met by the Manipuri troops, who, however, failed to dislodge him from the position he had taken up at one end of the village. He was, however, unable to advance, and was recalled to Tammu, which he succeeded in reaching without loss. A Panjabi trader at Langthabal, named Hafiz Fateh Shah, gave much assistance to the detachment retiring on Tammu, and again to Lieutenant Grant on his advance on Manipur. For his loyalty and bravery on these occasions, he

has been rewarded by a money payment of Rs. 100, 12 plough cattle and a grant of 20 acres of land in Manipur rent free for life. He has also been given the title of "Lion hearted."

The only serious opposition to the march on Manipur was met by the Burma column near Pael, where some 300 of the enemy had encamped in a small earthwork. Of this number, 200 unwisely permitted themselves to be surrounded, and in the fight that ensued 193 were killed, our loss being one native officer killed and three British officers, one native officer, and one sepoy wounded. On arrival at Manipur the bodies of our officers and men were interred in the Residency cemetery; and the surplus troops shortly afterwards returned to India and Burma. The summer garrison retained in the valley comprised 8th Mountain Battery, 1-2nd Gurkha Rifles, 43rd Gurkha Rifles, 44th Gurkha Rifles. In October the 1-2nd Gurkha Rifles returned to India, and in the following month the Mountain Battery marched to Burma. The 44th Gurkha Rifles on being relieved by a wing of the 42nd Gurkha Rifles from Kohima returned to Shillong, and the permanent garrison in Manipur now consists of the 43rd Gurkha Rifles and the wing of the 42nd Gurkha Rifles."

**Punishment
of the guilty.**

In the meanwhile those principally responsible for the murder of the British officers were placed upon their trial. Kula Chandra, the acting Raja, Tekendrajit the *senapati*, and Angao Singh the third brother were brought before a special commission, which sentenced the *senapati* to death and the other two to transportation for life. The Tankul general, one of the most influential persons in the State, Niranjana Subadar, an ex-sepoy of the 84th Native Infantry, and Kajao Manipuri, the actual murderer of Mr. Grimwood, were all sentenced to death by the Political Agent. Gallows were erected on the polo ground, and the sentences duly carried out. As far as the eye could see the plain was white with women. In the Raja's days a criminal sentenced to death was occasionally reprieved if a sufficient number of women appeared to intercede for him, and, hoping that possibly

the old custom might still prevail, the women had assembled in their thousands. As the drop fell and the *senapati* and Tankul general were launched into eternity, a deep groan went up from the assembled throng.

The Government of India declared that the Manipur State was forfeit to the crown, but decided in their clemency to regrant it to a scion of a junior branch.* Their choice fell upon Chura Chand, the youngest of five brothers who were the great grandsons of Nur Singh through his fifth son Bhogendra. It has been already shown that Nur Singh, like Gambhir Singh (the father of Sur Chandra Kirti Singh), was a great-grandson of Gharib Nawaz, but he traced his descent through a younger son. The people, it is said, received the news with some surprise and disappointment. The common folk were in favour of annexation, and could not understand why, if the State was to be regranted, a boy should be selected, who, if nominally of royal descent, belonged to a family whose circumstances and surroundings were of the humblest.† Since 1891, the affairs of the State have been administered by the Political Agent during the minority of the Raja, and various reforms, which will be described in the following chapters, have been initiated.

The history of the Royal family, and of the internecine feuds with which it has been torn, has now been traced from the time of Gharib Nawaz, the founder of the

Regrant of
Manipur
State.

History of
the Political
Agency.

* Notification No. 1700 E, dated 21st August, 1891.

† The Rajkumars of Manipur unless holding office differ in no way from the ordinary peasant. The women folk sell in the bazar, and the widow of a Raja sometimes has an establishment of a single servant and does not even possess a chair to offer to her visitors.

present dynasty, and the ancestor of innumerable hordes of Rajkumars. It now remains to refer to various other matters concerned with the history and administration of the State.

A Political Agent was first appointed in 1835, when the European officer deputed to supervise the Manipur levy was withdrawn. He was posted in the valley "for the preservation of a friendly intercourse and as a medium of communication with the Manipur Government, and, as occasion may require, with the Burmese authorities on that frontier, and more especially to prevent border feuds, which might lead to hostilities between the Manipuris and the Burmese." * In 1870, his duties were further defined by Government, and were said to consist primarily in insisting upon a strict fulfilment of the duties which the Raja is bound by treaty to perform, and in bringing his influence gently and gradually to bear upon the Raja for the reform of abuses in his internal administration.†

Proposal to
abolish the
Agency.

In 1861, the Civil Finance Commission under the presidency of Sir Richard Temple proposed that the Political Agency at Manipur should be abolished. The proposal did not commend itself to the Government of India, and it is said that the mere rumour of impending change was productive of ill effects in Manipur. "Every British subject made arrangements to leave. Trade with Burma almost ceased. Unoffending Nagas and Kukis who had been induced by former Political Agents to come down from their hills, were seized and

* Political correspondence. February 11th, 1835, No. 106.

† Political A. September, 1870, No. 169.

enslaved, and the people of one village under the protection of the Agent were ordered to pay Rs. 1,600 to realize which they had to sell their families.*” On the removal of Dr. Dillon in 1863, the question of the retention of the Political Agent was again raised, and in February 1864, the Raja himself asked that an officer might be posted in the valley. It was finally decided to accede to his request, for reasons which were set forth as follows in the orders of the Government of India. “The past history of the country shows that no Chief has been able to manage the people: they have one and all proved cruel, oppressive, and weak. The country has been the scene of civil wars, murders, devastation, and misery under the nominal control of the Chiefs; while as a rule, peace, order, and comparative prosperity reigned while a British Agent was present. Lastly, but not least, both the Chief himself and his people desire to have a British Agent amongst them; they have told Captain Stewart that the presence of one is equal to a brigade as regards the security of the country.†”

The Raja seems to have been anxious enough to receive a representative of the Government at his court, but the treatment accorded to him when he came was often far from satisfactory. In 1862, Dr. Dillon was appointed Agent, and in the following year the Raja submitted to the Government of India a document in which he formulated a number of serious charges against their local representative. No detailed enquiry was made

into these charges, as on other grounds the Governor General in Council was of opinion that Dr. Dillon had shewn that he was not qualified for the appointment which he held. Ten years later, charges were brought against the Officiating Political Agent, Colonel Thomson, which were found by the Government of India to be entirely false. Again in 1876, complaints were made to the Chief Commissioner against the Political Agent Dr. Brown. Colonel Keatinge warned the Raja that charges of this nature should not be lightly made against the representative of Government accredited to his court, but the Chief replied that he had satisfied himself by a strict examination that they were true. Orders were accordingly issued for an enquiry to be held in Manipur, and the conduct of the proceedings was entrusted to Colonel Sherer, the Deputy Commissioner of Darrang. Dr. Brown was too ill to attend during the proceedings, and died the day before their termination,* but he handed in a written statement and named the witnesses he wished to call on his behalf. On Colonel Sherer's report the Government of India remarked that there could be little doubt that much of what was alleged against Dr. Brown was untrue, trivial, and childish. They desired, however, that further evidence should be taken with regard to the 19th charge, non-payment of coolies; and Captain Durand, who had been appointed to officiate as Political Agent, was entrusted with the enquiry. The conclusion

* The Political Agents of Manipur have been unfortunate. In the residency garden there are the tombs of no less than four, who died, two of them violent deaths, between 1876 and 1891. The first Political Agent is buried at Laugthal,

come to by this officer was that the charges brought against Dr. Brown were the result of a deliberate conspiracy. The Raja and all the principal officers of the State were implicated, and evidence more or less false had been given throughout. A severe reproof was in consequence transmitted from the Government of India to the Raja.

The following account is given by Captain Durand of the position of the Political Agent :

Unsatisfactory position of the Political Agent.

"The Political Agent is dependent on the will and pleasure of the Maharaja for everything. His every word and movement are known to the Maharaja. He is in fact a British officer under Manipur surveillance. If the Maharaja is not pleased with the Political Agent he cannot get anything—he is ostracised; from bad coarse black atta which the Maharaja sells him as a favour, to the dhobi who washes his clothes, and the Nagas who work in his garden; he cannot purchase anything at any price. The court is almost openly hostile, though they have pliancy enough to pretend to a great regard for the Political Agent and the Sirkar." *

But it was not only in his attitude towards the Political Agent that the conduct of Chandra Kirti Singh was not above suspicion. In 1850, it became clear that Manipur was giving assistance to the Angami Nagas who were at that time a serious source of embarrassment to the Administration. Such conduct elicited a severe reproof from the Imperial Government, and for a time at any rate there was some improvement. In 1872-73, the Raja again adopted a most unseemly attitude, when steps were being taken for the demarcation of the boundary between Manipur and the Naga Hills. Every obstruction possible was offered, and the Raja even had

Manipur aids Angamis and opposes demarcation of frontier.

* Precipis of correspondence regarding Manipur affairs, by J. Clark, p. 28.

the effrontery to expressly "forbid" the Political Agent to enter the eastern portion of his territories. The Maharaja was sternly called to account by the Supreme Government, and was required to submit an ample apology for his improper conduct.

But is of
assistance in
the mutiny
and against
Lushais.

On the other hand, the attitude of the Raja during the mutiny was quite correct, and he was of material assistance in the Lushai expedition of 1871-72. Again in 1879, it was the timely appearance of Colonel Johnstone with the Manipuri troops which saved the garrison of Kohima from disaster. It must, however, be borne in mind that the Manipuris had no grounds for entertaining any feelings other than those of friendliness towards the British Government. It was to this Government that they owed their deliverance from Burma, their hereditary enemy. It was this Government that had strengthened their hands and so enabled them to subdue the hill tribes that surround the valley. On the north they were restrained from proceeding too far against the Angami Nagas, but activity in this quarter was likely to have few practical results. The various Political Agents seem to have been all agreed in condemning the native form of Government as very bad, but this is a question which it is hardly necessary to elaborate in a Gazetteer.* There was very little interference with the internal administration of the State, and the practical result of the connection of the British Government with Manipur was merely to guarantee it from invasion from without.

* The opinions of the Political Agents will be found summarised in the *Precis* of correspondence regarding Manipur affairs, by J. Clark, page 5.

A lengthy account of the relations of Manipur with Burma and with the tribes on the southern frontier, the Kamhows, Kukis, and Lushais, will be found in the North-East Frontier of Bengal by Mr. (afterwards Sir Alexander) Mackenzie, pages 160-212. The annexation of Burma and the Lushai Hills has put a stop to all trouble on that frontier, and no useful purpose would now be served by summarising the story of these raids.

Relations
with Burma
and tribes on
the southern
Frontier.

The events of 1891, if they did nothing else, afforded an excellent example of the necessity that exists for constant vigilance on the North-East Frontier. The Manipuris had a short way with the hillmen. The possession of muskets gave them an immense advantage over savages armed with spears and bill-hooks, and turbulence and insubordination were suppressed with stern severity. So firm was their rule that by some it was thought that the leopard had actually changed its spots, and that Nagas and Kukis had lost even the potentialities of violence. Lieutenant Dun, in 1882, declared that the Tankuls were thoroughly subject to the Manipuris and were "not in the least warlike." As soon as the Manipuri sepoys were withdrawn in 1891, this tribe reverted to the customs of its ancestors, and decided six longstanding disputes in its own way. Two of them were settled without actual homicide, but the remaining four cost altogether 80 lives. In the north-west corner of the State the Kukis raided the Kabui Naga village of Atteng and killed fifty-two persons, losing two of their own men in doing so. They also acted in a peculiarly treacherous manner towards the Nagas of the Makui village near Kaitemabi. These Nagas were in charge of

Turbulence
of the hill
tribes in
1891.

a state granary, and, on their refusing to supply the Kukis with some of the dhan, three of them were attacked and killed. The Kukis expressed regret for this occurrence, and in order to re-establish good relations invited the Nagas to a feast, at which they proposed to re-cement the bonds of friendship. The Nagas were weak enough to trust these savages, with the result that half-way through the meal the Kukis suddenly turned upon their guests and murdered seventeen! In addition to these more or less wholesale operations, seven persons were at various times murdered by Nagas on the Kohima-Manipur road, so that travelling in this portion of the State was a thing not wholly devoid of interest and excitement.

The Kuki
raid on
Swemi in
1893.

In the following year affairs were fairly quiet, and only seven murders were reported from the hills, though one of these murders was fraught with serious consequences. A Kuki, by name Toki, was of opinion that the Naga village of Swemi had stolen some of his paddy. When he went to complain, Swemi, far from giving satisfaction, killed the Naga he had taken with him to act as an interpreter. This occurred in December, 1892, and at first the Kukis seemed to take the matter fairly quietly. But all the while they were taking stock of their resources, and preparing a vengeance which, if long delayed, was complete and thorough when it came. Four months later they fell upon the doomed village in the gray light of the early morning when the people were still sleeping in their houses. Taken unawares they could not fight, and there was no time to fly; and when the avengers of the murdered interpreter and the stolen

grain had finished their grim work, they found that they had accounted for 286 of the offending villagers, 187 of whom were women and children. This raid was suitably punished; the hillmen then began to settle down once more, and during the last ten years have given comparatively little trouble.

CHAPTER III.

POPULATION.

Area and density—Imphal town—Villages—Growth of population—Birth-place—Sex—Marriage customs—Infirmities—Language—Caste—Physical appearance and moral characteristics—Hill tribes—Religion—Occupations—Games and amusements—Sradhs.

Density. THE Manipur State covers an area of 8,456 square miles and in 1901 had a population of 284,465, so that the density of the country as a whole is only 84 to the square mile. The greater part of the State consists, however, of hills, which can only support a sparse and scattered population, and in these mountain ranges there are only some 12 persons to the square mile. The area of the valley is not accurately known, but is probably about six hundred square miles. Here the density is a great deal higher, and is probably not less than 320 to the square mile, a figure which is considerably in excess of the rate recorded for any of the plains districts in the Province with the solitary exception of Sylhet.

Imphal town.

Manipur contains one town, Imphal, and 1,409 villages, 896 of which are situated in the hills. Imphal is, however, hardly a town in the sense in which that word

is generally understood. The site of the *pat* (the fortified enclosure in which prior to 1891 the Raja's palace stood) and a block of land to the west, have been constituted a reserve on which the Manipuris are not allowed to settle. Within the earthen ramparts of the *pat* are fine lines for the accommodation of eight companies of native troops, the military police hospital, the mess, and the bungalows of the regimental officers. All of these buildings are of red brick roofed with tiles, and the officers' houses recall the villas near Maidenhead or some other river-side resort more than the ordinary bungalow of the Indian plains. West of the *pat* is the residence of the Political Agent, and further back, beyond the afternoon bazar and the polo ground, is a row of *kaiyas'* shops, with the Manipuri court houses and the school close by. The rest of the town is nothing more than one huge village. The houses stand in spacious compounds, and are effectually hidden from the road by the screen of *ikra* which grows from the mud walls surrounding them. There are no shops, and the place is absolutely devoid of any urban features. Imphal is, in fact, nothing more than a cantonment situated at the northern end of an enormous village. In addition to the military lines the public buildings include the residency, the offices of the Political Agent and the Superintendent of the State, a post and a telegraph office, and a few smaller bungalows occupied by the Raja's tutor, the Assistant to the Political Agent, and the State Engineer. The central part of the town is well lighted with acetylene gas, far better lighted in fact than any other town in Assam. Acetylene gas, though

an excellent illuminating medium, is by no means cheap. Kerosine oil lamps were first tried, but so much oil was stolen from the lamps that it was found that the acetylene lamp, which was not exposed to depredations of this nature, was positively cheaper. There are seven protected tanks in the town from which the water is pumped and distributed through pipes to various localities. The Manipuri professes to be unable to drink this pipe water, but his scruples appear to be quickly disappearing. In each house there is a filthy pond into which is drained all the surface water from the compound, little channels being especially cut to facilitate the process. Here the Manipuri washes his clothes and person, and then draws his drinking-water. The rivers are full of water in the rains, but in the dry season shrink to shallow muddy streams creeping languidly along at the bottom of their beds. The banks are high and steep, and at this season of the year their crests are fully twenty feet above the level of the water. The roads in the town are well kept up, and though most of them are unmetalled, are in excellent order, at any rate in the cold weather.

Villages.

The ordinary Manipuri village resembles to some extent the villages of the Surma Valley. Little is to be seen from outside except bamboos, and to a stranger looking from above on to these shady groves, there is nothing to suggest that they are centres of population of anything more interesting than birds or monkeys. They are, however, much more clearly defined units than the villages of the Surma Valley. In Sylhet the bamboo groves seem to stretch for miles. Villages and hamlet

melt imperceptibly into one another, and it is often difficult to say where one begins and another ends. There is none of this uncertainty in Manipur. The village is set down fair and square in the middle of the rice fields tilled by its inhabitants, and it is sometimes several miles or more to its nearest neighbour. The houses have larger gardens than is usual in Assam, and the ground around the homestead is often sown with mustard. This garden is surrounded with a stout mud wall, and the place is fairly free from jungle. In Assam the cottages of the villagers are hemmed in by a thick wall of bamboos, plantains, areca palms, and other trees, which effectually exclude all light and air. The ground even in the winter time is damp, and wide-leaved arums cover the soil and add to the general humidity. This is not the case in Manipur. There are comparatively few bamboos or plantains, there are no areca palms, for they will not grow in this upland valley, and there is little jungle. The homestead is exposed to the purifying influences of the sun and air, and is a much healthier place to live in than the damp, dark cottages of the Assamese. In the hills the villages are generally built on a bare spot near the summit of a ridge. The houses are placed in proximity to one another and there are no gardens, so that a large Naga village almost attains the dignity of a little town.

The first census of Manipur was taken in 1881 and disclosed a population of 221,070. In 1891, the census schedules were filled up, but the papers were destroyed in the disturbances that occurred soon after, and there is no information available even with regard to the gross

Growth of
population.

population of the State. In 1901, the population was 284,465, which showed an increase of 28·61 per cent. in the 20 years. There is practically no immigration, and it is probable that a portion of the increase was due to the greater accuracy of the enumeration carried out under the direction of the Political Agent, the earlier census having been taken by the Durbar. A census of Manipur is not entirely free from difficulty. After the schedules had been filled up the entries had to be copied in Bengali on to slips of paper by persons who were acquainted with both Manipuri and Bengali, and the number of people who can read and write both Manipuri and Bengali is by no means large. These slips had then to be sent to the central census office at Gauhati, but the road at the time when they were despatched was very bad, and more than five weeks were consumed on the journey from Imphal to Dimapur.

Birthplace.

Manipur is most effectually cut off from the outside world, and 99 per cent. of the people censused there in 1901 had been born within its boundaries. About one-third of the total number of foreigners had come from the United Provinces of Agra and Oudh and were employed as cartmen and in other menial capacities. Bengal and Nepal together supplied rather more than another third, and there were a few artisans from the Punjab. Detailed figures for immigrants will be found in Table III. There are large colonies of Manipuris in the Surma Valley, but these people left their country during the troublous times in the first half of the 19th century, and in 1901 there were only 8,448 persons who had been born in Manipur, and were living at the time of the census in

British districts of Assam.* About one-third of these people were found in the Surma Valley, one-third in the Naga Hills, and one-sixth in the hills inhabited by the Lushais.

The women in Manipur exceed the men in numbers ^{Sex.} in spite of the preponderance of the male sex amongst the immigrant population. This holds good of the three main classes in the community, *i.e.*, the Manipuris, who style themselves Kshattriyas, the Nagas, and the Kukis. Amongst the Brahmans alone is there a deficiency of women. Few things are more difficult to ascertain than the laws which govern the proportions of the sexes, but the preponderance of women in Manipur is apparently due more to a moderately reasonable death-rate than to an exceptionally large supply of female babies, as under five there is not much difference between the numbers of the sexes. The women of Manipur are shrewd, capable people, who at all stages of their career are allowed the fullest liberty. They are not exposed to the risks of infant marriage,† or mewed up within the four walls of their houses, and the comparatively healthy life they lead is no doubt the principal cause of their longevity. The deficiency of Brahman women is no doubt partly due to the fact that they sometimes contract alliances with non-Brahman Manipuris and thus sink to the status of their husbands. Brahman men also not unfrequently marry beneath them, but such a proceeding in their case entails no loss of caste.

* There were, however, 44,700 Manipuris in the Surma Valley and 21,300 Kshattriyas. Most of the latter were probably Manipuris.

† Out of the 59,000 married women in Manipur in 1901 only 600 were less than 15 years of age.

Marriage
amongst
Manipuris.
The regular
ceremony.

In the plains there are three forms of marriage ceremony in vogue. Amongst the upper classes the preliminaries of the match are arranged by the guardians of the contracting parties, who are not allowed to have much to do with the selection of their future partners. When the arrangement is complete, the female friends of the bridegroom's family go to the girl's house with betelnut, sweetmeats, molasses, sugarcane, fruit, curds and light refreshments of this nature. These are distributed amongst the neighbours of the bride, who are then for the first time formally notified of the proposed alliance. This ceremony is called *Haijabokpuba*. Suits for breach of promise of marriage receive little encouragement in the State, for, though the food provided on this occasion costs about twenty rupees, the penalty assessed if the girl declines to comply with her engagements is only half that sum. No allowance is made for wounded feelings, and, if the boy is ungallant enough to break off the match, he escapes scot-free and his fiancée has to console herself as best she can. If all goes well a date is fixed for the final marriage ceremony, which is called *Luhongba*, and which generally takes place from six months to two years after the girl has attained puberty. In the afternoon the bridegroom goes to the bride's house, accompanied by his friends and relatives. Light refreshments, which are provided by the father of the bride, are handed round, and a Brahman is in attendance to perform the marriage ceremony. The sacred fire of mango wood is lighted, *ghi* is thrown into it, and the hands of the happy couple are tied together with a whip of *kusha* grass, while the priest

pronounces over them the appropriate *mantras*. The newly-married couple then retire inside the house, and a good deal of friendly chaff goes on amongst their boy and girl acquaintances. In the afternoon the bridegroom goes to his house, and in the evening his young wife is brought there in a dhuli and duly handed over to him. Both families make such presents to the newly-married couple as they can afford, but the obligatory expenses of the ceremony do not generally exceed some thirty or forty rupees. No price is demanded for the bride, unless she is of royal descent; the priest is content with a cloth and a rupee or two; and a sheet, which does not cost more than five or six annas, is sufficient wage for each of the musicians who have been engaged to attend the feast.

In cases where the people are too poor to afford even this moderate expenditure, the girl and the young man are taken by their guardians before some shrine, where, in the presence of the idol, the girl is formally made over to her husband. But simple and inexpensive though these forms of marriage are, they are generally dispensed with by the ordinary villager. Boys and girls have plenty of opportunity of meeting one another and falling in love like their brothers and sisters in the west, and after some months of courtship the damsel consents to elope with her young lover. He goes to her house at night with a party of friends armed with sticks to protect them from a rescue, the girl steals out after her parents are asleep, and they hurriedly make off to her lover's house. On the following morning an ambassador goes from the boy to the girl's home, and tells her father

The simple forms.

of all that has been done. If the match is a fairly reasonable one all will now be well, but if the boy is of inferior family the offended parents will decline to have anything more to do with their misguided daughter. Sometimes the young couple go to make their peace themselves. The old folks will be sitting in the house some few nights after the elopement, when suddenly weeping and wailing is heard outside the compound. The noise draws nearer, and at last the errant daughter and her lover present themselves before the outraged parents. At first there is no talk of forgiveness, but after a time the mother is won round, and peace is once more restored within the family. Four-fifths of the marriages of Manipur are said to begin with an elopement. The man while he is courting his bride naturally makes himself agreeable to her parents. He brings them little presents, works for them, and makes himself generally useful about the house and farm. The father of the girl does not wish to lose the services of his daughter or the attentions of his would-be son-in-law, and keeps putting off the marriage from month to month, till the young people are at last compelled to take the matter into their own hands. The marriage tie is not regarded with much sanctity in Manipur and can be dissolved by either side at will. The father keeps the children, but if there is an infant still at the breast it is left with the mother till it has been weaned. Adultery in the wife is regarded as a comparatively venial fault. Sometimes the husband turns her out, and the adulterer, if caught; is required to pay a penalty of Rs. 50; sometimes he merely gives the woman a good beating and lets the

matter go at that. The marriage customs of the hill tribes are described at length in the monographs by Mr. Hodson.

The following abstract shows out of 10,000 males *Infirmities*, the number afflicted with the four special infirmities recorded at the census of 1901.

	Manipur.	Assam.	India.
Insane ...	2	5	3
Deaf-mutes ...	2	9	6
Blind ...	6	10	12
Lepers ...	3	13	5

The proportion of afflicted persons is small, and it is possible that owing to the exceptional difficulties which attend the taking of a census in Manipur, the returns were not as accurate as they were elsewhere. There seems, however, to be little doubt that infirmities are far from common in the valley. In 1869 Dr. Brown reported that leprosy and madness were extremely rare, and that eye diseases and deformities were quite exceptional. The immunity from brain disease he attributed to abstinence from intoxicating drugs and liquors,* and it is only natural that in an unusually healthy population the number of those congenitally deaf should be exceptionally small.

The three principal languages spoken in the State *Language*. are Manipuri or Meithei, Naga, and Kuki. At the census of 1901 the enumerators did not record the different dialects spoken by the various Naga tribes but lumped

* It is doubtful whether temperance has much to do with the matter. The inhabitants of the Goalpara district are, as a whole, unusually temperate, and at the same time unusually mad.

them together under the one generic term. Dr. Grierson classifies them as follows :—

Sopvoma or Mao Naga, spoken by	...	10,000
Maram	" "	2,500
Miyangkhang	" "	5,000
Kwoireng	" "	5,500
Lahupa or Tankul	" "	25,000
Maring	" "	1,500
Kapui	" "	11,000
Koirao	" "	15,000

It will be understood that the figures given above are merely estimates. Kapui Naga is said to be a transition language between Bodo and Angami, and Koirao is akin to it. The other six are allied both to Angami Naga and to Kuki. What little is known about the languages of Manipur will be found in Vol. III, Part II of the Linguistic Survey of India by Dr. G. A. Grierson. Meithei or ordinary Manipuri belongs to the Kuki Chin group of languages and is described at length in Vol. III, Part III of Dr. Grierson's work. Unlike most of the languages on the North East Frontier, it had a written character of its own, but this has been to a great extent displaced by the Bengali alphabet.

Caste. The caste rules of Manipur differ very materially from those in force in the Surma Valley or Bengal. At the head of the community come the Brahmans, who were originally, no doubt, descended from immigrants from the west, though the custom which permits them to intermarry with Kshattriya women without losing caste must have by now effected a thorough fusion of the blood. The great bulk of the Manipuris call themselves

Kshattriya and wear the sacred thread, but they do not apparently lay claim to a western origin. At the bottom of the social scale come the Haris who were originally sweepers, though they no longer perform the needful but disgusting functions of their caste.

The Bishnupuriya Manipuris almost form a separate caste, and are said to be the descendants of 120 Hindu families of different castes, who were brought into the valley by Gharib Nawaz in the latter half of the eighteenth century to teach the indigenous inhabitants of the valley the customs of the Hindus. They intermarried with the people of the country, but after a time the Meithei, or original Manipuri race, came to the conclusion that the new-comers were of inferior stock, and they are now regarded with a certain measure of contempt. Both parties style themselves Kshattriyas, and in Manipur intermarry with one another. In the Surma Valley the distinction is more rigidly observed, and intermarriage is not generally allowed. According to another version they are Manipuris who came from Lakhipur in Cachar with a *salagram* called Bishnu, which is thought to be possessed of peculiar sanctity. Marjit took it with him in his flight to Cachar, and the party that brought it back across the hills first stopped at Bishenpur where the path descends from the Laimatol into the plain. They were then sent to Ningtho kong, and the duty of providing grass for the Raja's stable was entrusted to them. Another story says that they are the illegitimate descendants of a Manipuri Raja who stayed some time at Ningtho kong. Both of these legends fail to account for the undoubted physiological differences between

The Bishnu-
puriya Mani-
puris.

Bishnupuriya and other Manipuris, or for the slightly inferior position which they hold.

The Lairikyembum and Maiangs.

Another class are the Lairikyembum or writers, the descendants of families who probably originally came to Manipur as clerks. They do not wear the sacred thread and still retain the Bengali titles Basu and Das, but in other respects have now been absorbed into the general mass of the Manipuri population. The Maiangs are immigrants from the west but they are allowed the *jus connubii* by the Meithei, provided that they conform to ordinary Manipuri custom.

The Lois.

The Lois are thus described by Dr. Brown :—*

“The Loi is not recognised as a pure Manipuri; they appear to be descendants of the former inhabitants of Moirang, one of the original tribes which formerly occupied the valley to the south. They were formerly independent, but were reduced ages ago by the Meithei: hence the name Loi or subdued which was given them after their subjection. They profess to be Hindus, but are not recognised as such by the orthodox. The Loi caste seems a sort of limbo for non-descripts of all descriptions. Manipuris are frequently degraded to Loi as a punishment: in this case, should it not be remitted, which it usually is after a time, the punishment descends to the wife and family of the culprit who become Lois. All descendants of people of low caste, other than Mussalmans, seem to be consigned to the Lois. They are, perhaps, the most hardworking and useful class of people in the valley. All the men are employed in salt-making. Silk manufacture and fishing belong to this class. The Lois appear to have a separate language. One village of them, called Sengmai, speak a language only understood by themselves: this language is said to have an affinity with the Burmese. Amongst the Lois are a section chiefly engaged as fishermen on the Loktak lake, who do not perform lalloop but pay tribute to the Raja. This most probably arose from the necessity of having no risk of the supply of fish, which forms the staple food of the people, being intermittent. This branch of the Lois is called ‘Sel Loi’ (Sel,

* Pages 39 and 40.

the bell metal coin of the country). They consist of about 250 families, and each family has to pay a tax of about Rs. 2-4-0 monthly. This seems a very severe tax, considering the poverty of the country, but I am informed that they occasionally make large hauls of fish, which they are allowed freely to dispose of without any restriction; also that in bad seasons the amount of tribute is reduced. McCulloch says (account page 13):—‘Of the Lois in the valley, the Sel Loi is considered the lowest.’ This is not confirmed by the Manipuris, who state that the Sel Loi is considered rather a good class among themselves. There is a village to the south of the valley, named Shugunu, and containing about three or four hundred people who are descendants of Manipuris formerly reduced to the Loi caste. They are chiefly employed as wood-cutters and house-builders.”

Three thousand six hundred and eighteen persons described themselves as Loi at the last census.

The following twenty-six functioned groups are mentioned by Dr. Brown.* Functional Groups.

- | | | |
|-------------------|-----|--|
| 1. Ningthan Selba | ... | Raja's body and house servants. |
| 2. Lima Selba | ... | Ranee's body and house servants. |
| 3. Maiba Sunglei | ... | Act as Kabirajes or medical Practitioners. |
| 4. Paga | ... | Court of justice for women. |
| 5. Pena Kongba | ... | Musicians and singers. |
| 6. Sagong sung | ... | Overseers of the royal stables. |
| 7. Samoo sung | ... | Overseers of elephants. |
| 8. Arangba | ... | Butlers. |
| 9. Thangja panaba | ... | Overseers of black-smiths. |
| 10. Boladeb Seina | ... | Overseers of firewood. |
| 11. Phauroogba | ... | Overseers of rice. |
| 12. Toomjaroongba | ... | Overseers of salt. |
| 13. Poogay | ... | Charge of money-chest. |
| 14. Maiba tal | ... | Strike the gongs. |

* Page 39.

- | | | | |
|-----|---------------|-----|---------------------------------|
| 15. | Dulai baba | ... | Chaprasis and messengers. |
| 16. | Apalba | ... | Mounted troops. |
| 17. | Sebok achamba | ... | Raja's sword-bearers. |
| 18. | Oosaaba | ... | Carpenters. |
| 19. | Lauroongba | ... | Cultivators. |
| 20. | Thangjaba | ... | Working blacksmiths. |
| 21. | Konyoung | ... | Jewellers and workers in brass. |
| 22. | Koodumba | ... | Bone-setters. |
| 23. | Ahaiba | ... | Metal-casters. |
| 24. | Sunglel | ... | Cutchery work. |
| 25. | Sungooba | ... | Cutchery work. |
| 26. | Lai kai | ... | House-builders. |

Other sections are the Phoongnai and Potsungba, who were originally the Raja's slaves, and the Ayokpa and Kei, who are converted Nagas. These seem, however, to be mere functional groups, which can intermarry and eat with one another, whose very names will probably be forgotten, now that the lalup system on which they were based has been abolished. The Manipuris are further divided into different sections called *Imnak*, some of which are debarred from intermarriage with others. The whole caste system of Manipur is, however, of comparatively recent growth, and there has not yet been time for the development of the excrescences and deformities which, in places like Bengal, have completely obscured the intentions of its founders. Even a Naga can become a Kshattriya and adopt the sacred thread, and in the second generation will be accepted as a full Hindu, and the religion and caste system of the Manipuris is thus a curious mixture of laxity and formalism.

Rajkumars.

Some reference must now be made to the Rajkumars

though they are a caste in the sense in which that word is used in England, and not a caste as Hindus ordinarily understand that term. They are the descendants of the various Rajas of Manipur. Owing to the prevalence of revolutions there were many Rajas in the State, and as each Raja was generally a man of catholic heart, the total number of their descendants is extremely large. Prior to 1891, they were to some extent regarded as a privileged class, but even then many of them had sunk to the position of ordinary villagers. At the present day, the ordinary Rajkumar is a man of no influence or dignity, and is often an idle, discontented fellow, who would rather live by his wits than turn his hand to honest work. The custom with regard to royal marriages is, by the way, the exact converse of that which prevails in Europe, as the Raja, far from being prohibited from marrying a commoner, is not allowed to marry a Rajakumari.

The ordinary Manipuri is by no means an uncomely Physical Appearance. person. The men are tall, well built, and muscular, and do not generally run to fat. The complexion is usually fair, and the features often regular. In some the Mongolian strain is very marked, in others the finely-chiselled nose and well-set eyes suggest a completely different origin. Many of the Nagas too have regular features which do not in any way recall the Mongolian or Dravidian stock.

From certain points of view there is much that is Moral Characteristics. attractive about the Manipuris. They are clean and neat, dress themselves well, and live in excellent houses. Men and women alike are clever workmen, and they are fairly

ready to adopt new fashions. The women are shrewd and quick, and, though quiet enough in their manner, have none of that false modesty which seems so objectionable to European eyes. All this is fair enough but there is another side to the shield. Honour, even the honour that prevails amongst thieves, seems to be absolutely unknown to them. Their history is a painful record of feuds in which brother all too often met his death at his brother's hands. The patriarchal instinct is non-existent. There is no head of the family or clan round which the other members rally; *chacun pour soi* is the motto of all. Loyalty seems unknown. When a man is in power his fellows cringe before him; deprive him of his office and they spurn him. Calm and even-tempered they are generally cowards, though now and again displaying reckless courage. Their views with regard to the relations between the sexes are extremely lax. The man has to a great extent divested himself of the responsibility of providing for his children, and the question of their exact paternity is thus no longer a matter of vital interest. Most married women are said to have a paramour, most married men a mistress, and as long as there is no open scandal, the husband winks at his wife's diversions. The Manipuris seem to have little capacity for affection and it is dangerous to trust or rely on them in any way.

The hill
tribes.

The hill tribes fall into two main divisions, the Nagas and the Kukis. The Nagas numbered altogether in 1901 some 59,000 souls and are sub-divided into different tribes. Details for the population of each tribe in 1901 are unfortunately not forthcoming, and those

for 1881 are only estimates. The following figures are given by Captain Dun in his Gazetteer of Manipur* :—

Tankul and Lahupa	...	...	32,952.
Koirao (Mao Maram)	...	...	17,992.
Kaupui (Kapui)...	...	...	8,476.
Maring	...	...	484.

It is unnecessary to describe the manners and customs of these hill tribes here, as the whole subject is treated at length in the monographs which are now under preparation by Mr. Hodson. The Tankuls or Lahupas occupy the eastern hills. The men shave the hair on either side of the head and let it grow in a short stubble down the centre of the skull like a cock's comb, a curious custom which enables them to be distinguished at a glance from other hillmen. To the north the Tankuls carve out the hill sides into terraces on which they grow transplanted rice. To the south they follow the ordinary migratory system of cultivation known as *jhum*. The Koirao or Mao-Maram Nagas live in the north-west of the State, and closely resemble the Angami Nagas who adjoin them on the north. They wear the Angami kilt and grow their rice on terraces cut along the side of the hills. The Kapui Nagas occupy the hills between Cachar and Manipur. They sow their rice broadcast over the hills like most hill tribes, and are small men with no great muscular development. The men part and brush their hair with a neatness quite unusual in the ordinary savage, and plaster it down with grease till it shines again. The

* Page 28.

toilet is completed by a Grecian fillet round the head, and the general effect is not unpleasing. Many of these Nagas are handsome men with regular features and Grecian noses, and have very little trace of the Mongolian in their physiognomy. Their houses have practically no walls, the roof, which is of a V shaped pattern, reaching to the ground on either side. The Marings are a small tribe who live to the south of the Tankul Nagas. They also are *jhum* cultivators, but, as they have comparatively little land, they are compelled to husband their resources. They are unable to shift their fields from year to year, so they cut an elaborate system of drains along the face of the hill, and thus check to some extent the tendency of the rain-water to carry off the surface soil. Like the Daflas they let their hair grow long and then coil it up into a knot over the forehead. The Aimols are another small Naga clan who live south of the Marings.

The Kukis.

The Kukis live in the southern hills, and are pushing their villages into the Kapui country on the west and the Tankul country on the east. They are divided into two sections "old" and "new," and entered Manipur from the south, driven on by the great northward movement of the tribes which landed the Lushais in the hills that bear their name. They are divided into different clans called after the chief who was the original founder. The best known clans amongst the new Kukis are the Thado, Vungson, Changsen, Shingsol, Mangvung, Khlangam, Chungloe, Changput, Haukib, Simmte, and Kamhau. The old Kuki clans are the Kom, Anal, Namfau, Chim, Koireng, Chohte, Purum,

Mantak, and Hiroi. The Kukis are *jhum* cultivators and, as has been already seen, are the most turbulent of the hill tribes in Manipur. Other minor tribes are the Kom and Koirang who occupy the hills that overhang the valley near Moirang, and the Chirus who live in the hills to the west and south of the valley.

In 1901, 60 per cent. of the population of the State described themselves as Hindus, 86 per cent. were animistic tribes, and nearly 4 per cent. Muhammadans. The Manipuris, like most new converts, are full of zeal for their religion. They are much under the influence of their priests, and in every Brahman's house in Imphal town there is a neat building used as a shrine for the presiding deity, and an open shed (*mandap*) where the villagers assemble for *sankirtan*, the songs and hymns which form so large a part in the ritual of the Vaishnavites. The houses of these Brahmans can be easily distinguished, as all round the shrine flags of white cloth cut into strange devices flutter from tall bamboos. The profane foot of a European must not enter even the compound of a Brahman, and, if he so much as steps on to the verandah of an ordinary villager, the house will be instantly abandoned and another erected in its place. The people abstain from liquor and intoxicating drugs, and will not touch animal food of any kind. The tulsi plant is carefully cultivated in the centre of each compound, and they are most particular with regard to the application of the *tilak* or mark which is peculiar to the Vaishnavites. At the same time they are free from those unwholesome ideas with regard to the treatment of their womenkind which have infected the Hinduism of

Religion :
Hinduism.

Bengal, and which are entirely opposed to what is known of the customs of the early Aryans. Early marriage and the purdah are unknown, and the Manipuri women enjoy fully as much freedom as their sisters in the hills. The rules of caste are also much relaxed. If a Manipuri Brahman marries a woman of a lower caste, their children still are Brahmans, while, still more wonderful, if a Brahman woman marries beneath her, she simply sinks to the position of her husband. There is no prejudice too against the sale of fish, an occupation which amongst most Hindus is restricted to the humblest castes, and even Brahman women are not above retailing this article of food in the bazar. On the other hand the Brahmans will not, as a rule, take water drawn by members of any other castes, though an exception is made in favour of a certain family of well-born Kshattriyas who act as water-carriers for the Raja. Like all good Vaishnavites the principal deity whom they adore is Krishna, who is worshipped under the name of Gobindji.

The new and
the old
Brahmans.

The nomination of the present Raja to the throne gave rise to some ill-feeling amongst the Manipuri Brahmans. The causes and consequences of this dispute were thus described in the Report submitted by the Political Agent for the year 1895-96.

"The dispute took its origin with the nomination of the present minor Raja to the Gaddi. He is a descendant (great-grandson) of a former Raja of Manipur, named Nur Singh, and when he and his family came into the possession of the idol Gobind, which is the god of the reigning Manipur Prince, the family priests or Brahmans were preferred to the Royal temple, and the former Brahmans who officiated in the post in continuity, with one short exception, since Manipur history takes count,

were dismissed. The latter became known as *Aribas*, and the new Brahmans as *Anoubas*, the distinguishing words meaning "old" and "new" respectively. The *Aribas* having held office under the royal patronage for so many years, were in the great majority; and naturally their disciples were in overwhelming numbers, as compared with the followers of the *Anoubas*. Notwithstanding this fact, the *Anoubas* were in a position to cause much trouble, for, as stated above, they were in possession of the Royal temple and its resident idol Gobind, and by the persons who were for this reason excluded from the religious observances at the temple, the disappointment was keenly felt. Then, again, the *Anoubas*, who for so many years had been passive, soon became aggressive, and every Manipuri village, large or small, throughout the valley was at once supplied with an *Anouba* Brahman from Imphal, whose chief aim was to wrest disciples from the opposition camp. Under the ordinary conditions of life, there would seem to be little or no harm in this action, but no better system of log-rolling disputes could be invented. Whatever may be the case in Hindu communities elsewhere, the Brahman priest among the Manipuris is a necessity, his services are always in request: at births, marriages, and deaths, at certain ages of the children, at feasts and holidays, at laying of foundation-stones, which in Manipur is the erection of the main posts of the new house, and on many other occasions the priest must attend. Without his presence all will not be well. Such being the state of society, party disputes on these important occasions are unseemly, and cause extreme irritation. Here family circles are large, and when the moment arrived for the call of a Brahman, there was generally some mischievous member ready to oppose the choice of the priest. In a family of almost all *Aribas*, i.e., the disciples of an *Ariba* Brahman, this troublesome person would raise the question of inviting an *Anouba*, and peace and calm were at an end. Until the matter was settled by a competent authority, a marriage had to be postponed, or even a dead body had to wait removal to the funeral pyre.

It is said that this troublesome dispute has at last been closed.

There are seven principal temples in the town Temples. of Imphal which are consecrated to Gobindji, Brindaban Chandra, Senamahi, Nityananda, Bijoy Gobinda, Ramji, Mahabali, and Kamakhya. The first two of these

temples are situated in the Rajbari, and all, except the last two, are mere temporary structures made of timber, bamboo, and thatch. Mahabali's temple is a small masonry building, and is better known for the grove by which it is surrounded, which is inhabited by swarms of monkeys who are regularly fed by the presiding priest, and for whose maintenance a monthly allowance of ten maunds of rice is given by the State. The shrine of Kamakhya is merely a roof supported on posts above the image. Prior to the disturbances of 1891 there were seven masonry temples in the town, but they lost their sanctity during the fighting that took place, and some of them have been since diverted to secular uses. The principal temple to Gobindji stands opposite to the old palace site, and consists of a square building with a porch supported on masonry pillars. In front of this porch there is an arcade, flanked with a square tower on either hand, in which nautches used formerly to be held. Another fine temple is the one which was dedicated to Brindaban Chandra. It is built in the form of a square tower, and was captured and held by the British troops during the fighting that took place in 1891.

Muhamma-
dans.

The Muhammadans of Manipur are, according to Brown,* the descendants of immigrants from the Surma Valley who married Manipuri women. Their ranks were further swelled by marriages between the female descendants of these people and Manipuris, at a time when the views on this subject were not so rigid as they are at the present day. Their maulavis are Manipuris, who have

* Page 41.

been sent to Cachar to be instructed in the principles of their faith by maulavis from Hindustan. They are said to be fairly well acquainted with the doctrines of their religion; they abstain from pork and bury their dead, but the rite of circumcision is only very imperfectly performed. There are no masonry mosques in the State, and foreign Muhammadans in Imphal have a separate maulavi of their own.

The religion of the hill tribes is of the usual animis- **Animism.**
tic type. They seem to have vague ideas of a future life, and attribute the troubles that beset them in their earthly career to the machinations of evil spirits whom they endeavour to propitiate. For a fuller account of this subject reference should be made to the monographs on the hill tribes by Mr. Hodson.

In 1901, there were eight Jains in the State who were **Other religions.**
merchants from Marwar, 145 Buddhists, most of whom were Nepalese, and 45 Christians. In 1894, a missionary came to Manipur and was allowed to make his headquarters at Ukrul amongst the Tankul Nagas. The people have not as yet shown any tendency to adopt the new faith, and, according to the census returns, there were only eight Native Christians in Manipur in 1901.

The occupations recorded at the last census were **Occupations.**
divided into no less than 520 different heads, details for which will be found in the second part of the Report on the Census of 1901. So elaborate a classification is, however, hardly suitable for a State like Manipur, and the figures would not repay detailed examination. No less than 37,504 women were shown as supported by the preparation of cotton cloth, but, though a very large

quantity of cotton cloth of different kinds is produced in Manipur, most of these women workers are the wives or daughters of petty farmers, and nearly all of them are dependent on the land for their support. There are various other industries in the State which are described in Chapter V, but they are generally followed as a means of livelihood subsidiary to and supplemental to agriculture, and it would be difficult to ascertain the number of people actually working at these occupations. In 1901 the people were divided into the following eight main orders: Government, 3,337 or 1 per cent.; Pasture and agriculture 207,265 or 73 per cent.; Personal services, 1,257 or 0·4 per cent.; Preparation and supply of material substances, 62,988 or 22 per cent.; Commerce, transport and storage, 2,907 or 1 per cent.; Professions, 4,882 or 2 per cent.; Unskilled labour, not agricultural, 864, or 0·8 per cent.; Means of subsistence independent of occupation, 965 or 0·8 per cent.

Games and
amusements.

Hockey on horseback is the national game of Manipur. According to one tradition the game was introduced by a Raja named Vakungba about 300 years ago, while others say that hockey was first played in the time of Gharib Nawaz in the latter half of the 18th century. In the Manipuri game there are seven players on each side: there are no goal posts, and a point is scored whenever the ball is hit across the back line of the opposing side. There are no rules against crossing or fouling, and, were it not for the size of the ponies used, serious accidents would be very common. The polo costume consists of a scanty dhuti well tucked up so that the thighs are almost bare, while the calves are protected by brightly

coloured woollen gaiters. The pony's bridle is adorned with big pompons of coloured cotton, and on either side of the saddle there are great curved shields of lacquered leather. The head of the stick is placed at an obtuse angle to the shaft, so that the players usually strike the ball while it is at a considerable distance to the right or left of the pony. A good Manipuri has an extraordinary command over the ball, and is also a great adept at dribbling. They have, however, very little idea of combination, and generally play an entirely selfish game. The Manipuris ride extremely light, and the pace which they succeed in knocking out of their tiny little ponies is most remarkable. Other outdoor sports are foot and boat-racing and wrestling which are thus described by Dr. Brown.*

This Lamchel is a competition between the different "Pannahs" or classes among the Manipuri population. The Brahmans, as also the lowest class of Manipuris, the Lois, are not allowed to compete, but Musalmans may. The distance run by the competitors is a straight course from the brick bridge formerly mentioned to the inside of the Raja's enclosure; the distance is under half a mile. The first of the races consists of trials of speed by two pannahs at a time: the winners in these races run again when all have had their trial, and the first man in of the whole wins the race of the year. The first man receives as his reward sundry presents, and is excused from all forced labour or lalloop for the rest of his life; he becomes a hanger-on about the Raja usually after his victory. Old winners are allowed to run again for the honour of the thing: when they win more than once, they get presents. The first in at the preliminary races between the Pannahs are allowed three months' exemption from lalloop. These races cause great competition, and for months before they come off, various lanky-looking men, with a scanty proportion of clothing, may be seen

Lumchel or
foot races.

morning and evening trotting along the roads, getting themselves into training for the important event.

The Raja is always present at these and the other games, seated in a sort of gateway which bounds the straight road along which the races are run.

Wrestling.

After the races there is an exhibition of wrestling: this presents nothing very peculiar; the only thing that need be mentioned regarding it is a curious custom that prevails. The victor over the wrestler who competes with him, before salaming to the Raja, leaps up in the air, alighting on his left foot; as he descends he gives his right buttock a resounding slap with his right hand: having thus asserted his superior skill he makes his salaam in the usual manner.

The Hee-yang or boat races.

The boat races occupy three days in September, and take place on the moat which surrounds on three sides the Raja's enclosure. This ditch is about 25 or 30 yards broad, and, at the season when the boat races come off, contains plenty of water. This festival is the most important held in Manipur, and great preparations are made for it; stands are erected on both sides of the moat, the one for the Raja being of considerable size and height. The women occupy stands on the opposite side of the moat. The boats used in the races are two in number, one of great length and hollowed out of a single tree; the rowers number about 70 men, each with a short paddle. Besides the rowers are several men attending to the steering, and urging on the crew. One of these stands in the front of the boat, and, leaning on his paddle, encourages the efforts of the men by stamping violently with his right foot at intervals. The race itself differs from most boat-races in the fact that here the great object is for the one boat to foul the other and bore it into the bank, so that one side of the boat is disabled, the men not being able to use their paddles; the boats are thus always close together until at the finish, when the race is usually won by a foot or two only: the distance paddled is about a quarter of a mile. Each race is rowed twice, whichever wins, and the results are carried on from year to year. As in the Lumchel, the competitors are men belonging to the different Pannaahs. There are no rewards for the races, they being rowed merely for the honour of the thing. The Raja in his boat, which is like the others, but ornamented with a carved deer's head and horns gilded at the prow, accompanies the race; the Raja on the chief race-day steering his own boat in the dress formerly alluded to. McCulloch mentions in his account that the boat-race is not a fair race but a struggle between the rowers on either side, in which those who can deal the hardest blows are usually the victors. That fights occasionally

happen is correct, but they arise from accidental causes and are really not a premeditated part of the performance. While the boats are paddling down to the starting-place, a good deal of chaffing, flinging of weeds, water, etc., between the rival boats takes place, but all seems to be conducted in a good-humoured manner."

The moat is now quite dry, and boat-races can only take place on the river when they are full of water in the rains.

The Manipuris are fond of cards and chess, but the most popular of all indoor games is *Kangsana*. The following description of this game and of the great Manipuri epic is taken from the Account of the Valley of Manipur by Major McCulloch* :—

"It is played only in the spring, the players being generally young women and girls, with usually a sprinkling of men on each side. The game seems to cause great excitement, and there is great emulation between the sides. The Kang is the seed of a creeper; it is nearly circular, about an inch and a half in diameter and about three-quarters of an inch thick. This is placed on the ground upright, at one time with its broad side towards the party by whom it is to be struck, at another edge-wise. When the Kang is placed with its broad side to the party, it is to be pitched at with an ivory disk; when it is placed edge-wise, it is to be struck by the disk propelled on its flat side along the surface of the ground by the force of the middle finger of the right acting off the forefinger of the left. A good player can propel the disk in this way with great force and precision. The side having most hits wins. The whole is closed by a feast at the expense of the losers. Conundrums are a fertile source of amusement. They appear usually far-fetched, and sometimes not over delicate. The tale of Khamba and Thoibee, sung by their *essiesukpa* or bards, never fails, with a popular singer, to rivet attention. The scene of this tale and the place where it was originally sung is Moirang. The hero and heroine are persons said to have flourished hundreds of

years ago. Thoibee is the daughter of the Moirang chief's brother. She loves Khamba, a lad poor in worldly riches, but rich in personal beauty, of good descent, great modesty, courage, strength and agility. Thoibee herself is a young lady of unsurpassed beauty, and Khamba having seen her by chance while boating on the Loktak, loves her at first sight. But the course of true love never yet ran smooth, and it was no exception with these lovers. A person named Kong Yangba saw Thoibee's love for Khamba, and wishing to gain her for himself, he used all the means that a powerful connection gave him to crush Khamba. The various perils through which Khamba has to pass, and the constancy of Thoibee, form the subject of the song. After having won his foot-race, speared his tiger, caught a wild bull, and been tied to the foot of an elephant, Khamba gains Thoibee, who also passed through various troubles. The end is tragical. Khamba doubts his wife, and wishing to try her fidelity, she, not knowing who he was, spears him. Having discovered what she had done, she spears herself. Some of the characters introduced in the story are very good. The constant repetition of this tale only seems to increase the desire to hear it."

Dances.

The Manipuris and Nagas are very fond of dancing. The steps are generally simple, and there is a good deal of circling about and wheeling in and out, the evolutions having some resemblance to those performed by a Greek chorus. The hands are almost invariably carried at the level of the shoulder, with the fingers pointing upwards. The orchestra consists of one or more drums and perhaps a string instrument or two, and the performers keep time to the music. In one of the nautches the dresses used are extremely bright and picturesque. The bodice is of emerald-green satin covered with silver sequins. The under-skirt is of scarlet cloth in which small pieces of looking-glass have been inserted to catch the light, the over-skirt of a silvery muslin. The Nagas too wear bright-coloured cloths at their dances, and strange ornaments on their heads,

while the men keep time to the music with bill-hooks in their hands.

The Manipuris burn their dead, but differ from other Hindus in placing them in an open coffin on the funeral pyre. The *sradh* ceremony, as is only natural amongst a people who are so completely under the influence of their priests, is a very heavy charge upon the next of kin. A *sankirtan* party is always in attendance, and people occasionally dissipate almost the whole of their property on gifts to the presiding priests. Ordinary Manipuris, as they claim to be Kshattriyas, celebrate the *sradh* on the thirteenth day after the death occurs.

Ceremonies

tion with
death.

CHAPTER IV.

AGRICULTURE AND FORESTS.

Rice—Irrigation and floods—Sugar-cane—Fibres—Other crops—Jhum and terraced cultivation—Live stock—Farm implements—Forests.

Agriculture: **Rice.** THE staple crop of the valley is rice, which falls into three main divisions: *lingba* or transplanted rice; *dumahi* or high land broadcast rice; and *daotubi* which is a form of *aman*. There are no crop statistics available, but it is thought that about 85 per cent. of the total area under rice is *lingba*, about 12 per cent. *dumahi*, while the comparatively insignificant remainder is *daotubi*.

Lingba or transplanted rice is first sown in little beds or nurseries. The land is broken up in April or May, is ploughed five or six times till the ground is reduced to a puddle, and is carefully manured with cowdung and sweepings. The size of the nursery varies with the area to be planted out, but generally stands to the rice-fields in the proportion of 1 to 16. The seed, which has been selected from the largest ears of the previous year's crop, is steeped in water for two or three days, allowed to germinate, and then sown

broadcast over the bed in May and June. It comes up a rich emerald green, and at the beginning of summer these patches of brightest green herbage are a striking feature in the rural landscape. In the meanwhile the fields are being got ready for the reception of the seedlings. The husbandman starts ploughing as soon as the soil is softened by the spring rain, and repeats the process from four to eight times till he has reduced the land to a rich puddle of mud. After the third ploughing the field is harrowed, and the little embankments, a few inches high, intended to retain the water are repaired. When the seedlings are about seven or eight weeks' old, they are taken from the nursery-bed and carried in large bundles to the field. Here they are planted out in handfuls, each of which contains four or five plants. The distance at which these are planted from one another depends upon the fertility of the soil, and upon whether the work is done towards the beginning or end of the season. Transplanting goes on from the beginning of July to the middle of August. The work is of a most arduous description and involves stooping for hours in a field of liquid mud, but the Manipuris believe in the principle of co-operation. The bachelors and unmarried girls in the village combine to plant out the different little holdings, and with their songs and laughter strive to turn a tedious duty into an occasion of much fun and merriment. In places where the water lies too deep to allow of the plants being properly transplanted, the seed is scattered broadcast and sinks to the bottom and takes root. Before the end of the rains the crop is fully grown, though the ears are still empty; but about

the beginning of October they begin to fill and the field to turn to a rich yellow. From the middle of November to the middle of December harvesting is going on. The work is carried out by men and women alike. The plants are cut off close to the earth, and left in the fields for a few days to dry. When they are ready the grain is threshed out on a big mat. While the threshing is going on, song are sung, and prayers are offered up to God begging him to increase the produce of the fields. The grain is then carried home in baskets and stored in large bins made of bamboo mats. The richer men keep their rice in separate granaries, which are raised well above the ground from fear of damp. The straw is not wasted, as is usual in Assam, but is stacked and used as fodder for the cattle.

**Dumahi and
Daotubi.**

Dumahi is grown on land which is too high for transplanted paddy. Ploughing begins in May and is repeated six or seven times. The seed is sown broadcast in June; and the crop is harvested in September. No *ails* are thrown up to retain the water, and very little weeding is done. *Daotubi* is sown broadcast about the end of June, and ripens about the beginning of December. It is grown in every part of the valley in the low land that surrounds a *bil*, but the total area under this crop is comparatively small.

**Irrigation
and floods.**

The people are fully alive to the advantages of irrigation, and, near the foot of the hills, carry the water of the hill streams to their fields. In the lower part of the valley channels are often dug to bring the water from the rivers on to the land. This system of irrigation does not, however, render them independent of the

rainfall, as, if the rivers are low, the water does not enter these channels; and a dry season in Manipur often means a short crop. Floods occasionally do damage, and the sections of the rivers passing through Imphal *panna* are protected by embankments. In 1898, there was a serious flood. No less than 89 inches of rain fell in the two months of May and June; the river bunds were breached, and the polo ground went several feet under water. Deer and pig also injure the crop, especially in the southern part of the valley near the Loktak, and, if the weather is too damp and cloudy, insects attack the plants and sometimes do much damage. There are many different kinds of rice, but the following are the six best grades, ranged in the order of merit: *kumbhi*, *foiel*, *noin-ing*, *gobinda bhog*, *laikhuram foi*, and *chahow*.

The only variety of sugarcane raised in Manipur Sugarcane. has a hard red stem and is known as *chu*. A small patch of cane is often to be seen within the high mud walls that enclose the Manipuri homestead, but the total area under sugar is probably not large. The crop is propagated from the tops of the best canes which are cut off at harvest time and kept in a shady place. One of these tops yields on the average about five canes, and as they contain but little juice, the cultivator does not sacrifice much of the gross product of his fields in the cause of reproduction. The land is hoed up till it is reduced to a fine tilth, and the tops planted in trenches between April and June. While the crop is growing it is continually hoed and weeded, and about August the leaves should be tied up round each cluster of canes, though this troublesome precaution is occasionally neglected. The earth

from the ridges is heaped about the roots to strengthen their hold upon the soil, and this process is continued until the relative positions of ridge and trench are reversed, and the canes stand upon the ridges with trenches in between.

**Preparation
of molasses.**

The cane is pressed in the old-fashioned wooden mill. This consists of two wooden rollers fixed side by side in a trough hollowed out of a heavy block of wood. The tops of the two rollers pass through a hollow beam supported by uprights let through the lower block of wood into the ground, and are cut into the form of screws which fit into one another. To one of these rollers is affixed a pole which is driven round in a circle, and thus causes the rollers to revolve. The motive power is usually supplied by bullocks or buffaloes, and occasionally by the villagers themselves. The mill requires rather more knowledge of carpentry for its production than the other implements of agriculture and can only be made by the more skilful of the villagers. The cane is placed between the rollers and crushed as it is slowly forced through. Each handful is passed through the mill three or four times till nothing but foam appears. The juice trickles from the trough into the earthen pot or kerosine-oil tin placed in a hole below it, and from thence is transferred to a large earthenware vessel. It is boiled over a furnace dug in the ground, with two holes in the top for the reception of iron cauldrons. The Manipuris only boil the juice till it attains the consistency of treacle, and eat or sell it in this condition; but the Musalmans continue the process till it turns into thick molasses. A few iron Bihia mills have been

introduced into the State, but they are rather heavy to transport, and as the area of any given patch of cane is small, this is a serious drawback.

Very little jute is raised in Manipur, and the only ^{Fibres.} fibre of importance is cotton, which is extensively cultivated by the hill tribes, and is sometimes grown on the low hills in the valley. It is generally sown in *jhums* from which a crop of rice was taken in the previous year. The ground is hoed up and the seed sown in February or March. The fields are weeded in April and May, and the cotton plucked in September and October. There are three flushes of which the second is the best. Heavy rain injures the crop and a hailstorm sometimes destroys it altogether.

The other crops grown in Manipur are of little im- ^{Other crops.} portance from a commercial point of view. Mustard is sown inside the house enclosure or on the high land in the neighbourhood. A little *til* is also grown, but the total quantity exported is quite insignificant. Matikalai, which furnishes the staple kind of *dal* used by the people, peas, chillies, cabbages, and other kinds of vegetables are grown on high land. The Manipur potato is a small red tuber, but the Naini Tal varieties which have recently been introduced at Kangjupkul are doing well. Oats and wheat have been tried and proved successful. When an *atta*-eating regiment was stationed in the valley, the Manipuris grew a considerable quantity of wheat, and foreigners set up water-mills to convert it into flour; but on its relief by a Gurkha regiment the people were left without a market for their grain, and the area under wheat again sank to a very small figure. Of plantains

there are seven or eight varieties but none are of good quality. The trees die down in the winter time, and in March are cut away, to allow a new shoot to spring up from the old stock. The areca nut will not grow in the valley, and the pan vine (*piper betle*) has unusually small leaves. A larger variety of pan is, however, grown in the valleys that intersect the hills. The plants are trained-up trees, as is the custom in the Assam valley, and are not grown in enclosed gardens after the fashion followed by the Baruis of Bengal. When the soil and climate are favourable pan is an extraordinarily profitable crop, and some Naga villages in the valleys of the Barak and Irang are said to make as much as Rs. 200 per house per annum from pan alone. Oranges, pine-apples, and jack fruit thrive in the valley, but limes do not do well. Mangoes blossom and fruit luxuriantly, but the worm which ruins this fruit in Assam does not spare it in Manipur. There are, however, a few late-bearing trees and they yield excellent fruit. Various kinds of English fruit trees have been tried but so far have not proved particularly successful.

Tobacco.

Tobacco is cultivated as a garden crop. The seedlings are raised in carefully-manured beds in August and September. At the beginning of November they are transplanted into ground which has been reduced to a fine tilth, and protected from the sun by little sections of the plantain trunk. The bed is lightly hoed up two or three times, and not more than ten or twelve leaves are allowed to grow on each plant, the remainder being picked off as they appear. The leaves are gathered in February and March, and there is a second but

much inferior crop about two months later. If required for chewing they are dried under a shed, or else pressed into a hollow bamboo and allowed to ferment. When the tobacco is destined for the pipe, the leaves are piled up in heaps till they ferment, cut up and mixed with molasses, and are then ready for the hookah.

The ordinary methods of cultivation practised in the hills is the system known as *jhum*. The jungle growing on the hill side is cut down and burned between January and March. The seeds of hill rice, millet, and Job's tears are dibbled in amongst the ashes, and while the crop is growing it is weeded once or twice. The millet is harvested in July, the rice in November, and the Job's tears in the following months. Chillies, pumpkins, and *til* are also grown in the *jhums*, and cotton is a very important crop.

Cultivation
in the hills.
The *jhum*.

The system of *jhum* cultivation has many drawbacks. The crop is entirely dependent on the rainfall for the moisture it requires to bring it to maturity, much time and trouble has to be expended in the clearing of the *jhums*, and the amount of land required is very large. A *jhum* is, as a rule, only cultivated for two seasons in succession, and then allowed to fallow for seven or eight years. After the second year the yield falls off and the weeds spring up and choke the crop. There is a risk too that the roots of the scrub jungle may be killed, and the land depends to some extent for its fertility on the growth of this young jungle and its subsequent conversion into a bed of ash manure. A village thus requires of culturable land about five times the area actually under cultivation at any given time, and the outlying *jhums* of large

communities must of necessity be sometimes situated at a considerable distance from the village site.

The terraced cultivation of the Mao-Maram and Tankul Nagas.

A *jhum*, with crops springing up amongst the ashes and the charred stumps of the trees, is undoubtedly a primitive form of cultivation, which is only possible in a very sparsely peopled country. The terraced cultivation of the Mao-Maram and Tankul Nagas discloses a capacity for continuous and sustained hard work which is seldom found in a community of semi-savages. The slopes of the hills below their villages are cut out into a succession of terraces, which are irrigated from the hill streams, whose water is carefully distributed through little channels over every step in the series. Where the slope is fairly gentle, these terraces are sometimes nearly twenty yards in breadth and not more than two feet high, but fields as large as this are by no means common. The average terrace is more than three feet high and is not more than three or four yards wide, and is often built up with stone retaining walls. In places these stone walls are as much as five feet high, in places the terraces are not more than two feet wide, and, as they have to follow the contour of the hill side, they are never of any considerable length.

An ample supply of water is an absolute necessity for terraced cultivation, and, where this is to be had, fields are cut out on slopes which are almost precipitous in their steepness. Sometimes the terraces are simply cut out of the earth and are not faced with stone. The initial labour required to make these terraced fields is very great, but once made they give less trouble than a *jhum*. They are close to the village site, jungle clearing

and weeding are not necessary, and where they are irrigated from perennial springs the crop is absolutely sure and is not affected by variations in the rainfall. *Jhum* rice also does not do well at elevations of more than 4,000 feet above the sea, and, were it not for their terraces, many of the Mao-Maram Nagas would have to subsist on millet and Job's tears. This irrigated rice is raised in the same way as the *sali-dhan* of Assam. The soil is thoroughly saturated with moisture and then hoed up till it is reduced to a rich puddle. The rice has in the meanwhile been sown on the hill side, and, when the plants are from a month to six weeks' old, they are transplanted into the fields. Harvesting goes on in December, and the ears are cut off short by the head and threshed in the field before being carried up to the village.

The cattle are strong, hardy, little animals much Livestock. superior to the cattle of the Surma Valley or Assam. They are probably akin to the Burmese breed, as the best animals are said to come from Kakchingkunao at the southern end of the valley. A bull costs from Rs. 15 to Rs. 80, a bullock from Rs. 25 to Rs. 85, and a cow from Rs. 15 to Rs. 25. Some of the best cows are said to yield as much as three or four seers of milk. The buffaloes are also very fine animals and are used to drag the plough as well as for dairy purposes. Considerable herds of them are kept by Nepalese settlers at the northern end of the valley, and a special reserve has recently been set apart for these herdsmen in the Khoga Valley south of Moirang, to avoid the endless disputes which have been caused by the animals damaging the crops, when

graziers were allowed to settle in the neighbourhood of villages. Grazing fees are levied on foreign herdsmen at the rate of annas 8 for each buffalo and annas 4 for each smaller head of horned cattle. Cow buffaloes can be purchased near Kanglatombi for from Rs. 85 to Rs. 50, while a bull costs rather less. In the centre of the valley the prices are a little higher. Both cattle and buffaloes find a ready sale in Cachar, when exported to that district, and the sturdy little breed of bullocks has done much to develop the export trade along the cart road to Assam. The cattle are grazed in swamps and on the hills, and sometimes on rice straw, and there is not, as a rule, any dearth of suitable pasture. The Lamphel and Taiel *bils* near Imphal have been specially reserved as grazing grounds. Goats are not numerous, and the only sheep in Manipur are a few that are kept for the consumption of the European residents. Poultry, like most other living things, do very well in Manipur. A really first-class Manipuri pony is a splendid little creature, but good animals are unfortunately very rare. They are generally below twelve hands in height, but they have remarkable speed, courage, and endurance, and will carry a heavy man for many miles over rough or hilly country. Under native rule no attempt was made to regulate the breeding of the ponies; a good animal was generally appropriated for the Raja's stable, and, even as long ago as 1859, McCulloch wrote that the genuine Manipuri horse had nearly disappeared. In 1889, the Raja was presented with an Arab stallion and eight mares, but Arabs cannot thrive in the damp climate of Manipur, and the imported stock died out. At present

there are two stallions kept by the State, one a Burmese and one a small Australian.

The farm implements, as in the rest of the Province, <sup>Farm imple-
ments.</sup> are simple and inexpensive. The plough consists of a curved piece of wood, the front of which is shod with iron, fitted with a pole when drawn by a pair of bullocks, or a pair of shafts if intended for a buffalo. The harrow is a long-toothed rake drawn over the fields by a bullock, though sometimes its place is taken by a heavy log, which presses down weeds and rice alike. The rice springs up again on the following day, but the weeds droop and die. The hoe that is used to trim the *aills* in the paddy fields has a long but very narrow blade. The *charuing* or flail is like a wooden fork, with the handle bent at an angle of about 120 degrees. The handle is about 27 inches long, the prongs of the fork about 26. When the *dhan* has been threshed it is thrown into the air from a long-handled wooden shovel (*pho in cho*) and winnowed with a mat. It is then placed in large baskets and dragged to the homestead on a wheel-less sledge. For husking grain the Manipuris follow the fashion prevalent in the hills, and use a pestle and mortar instead of the *dhenki* of the Assam Valley.

The following account of the forests of Manipur is ^{Forests.} reproduced from the Gazetteer of Captain Dun:—

"The whole of the hill ranges lying between the valleys of Cachar and Manipur, and far to the north and south, are densely clothed to their summits with tree-jungle. Almost the only exception to this has been already stated in the description of the Manipur Valley, and refers to the hill slopes facing it. These slopes have been steadily cleared of their timber, and present a denuded appearance. The tree-forest presents a great variety; and in the ranges lying west of the Manipur

Valley there are large forest tracts of trees comprising Nagesar, Jarul, India-rubber, Tun, Oak, Ash, etc. Fir trees do not exist in the hills immediately adjoining the Cachar road.

Bamboo of the commoner kinds is plentiful between Cachar and Manipur. On the higher ranges to the north ringals and thorny bamboos are found. Round all the villages in the north-east portion of the hill territory the giant variety is grown, but is not common in other parts of the State.

In the Yomadung range, lying between Burma and Manipur, the jungle is much more open, very large trees are rarer than either towards the west or north, and the bamboo is confined to the low-lying ground and ravines. Fir trees are occasionally seen, but are not plentiful. The tea-plant is found in this range, and apparently spreads over a large area. Teak is common to the slope overlooking the Kubo Valley. The cinchona would most likely grow well on the slopes of the hills, especially those lying nearest to the Manipur valley and in the Hirok range. The tea-plant is common in the hills to the north. The only part of the immense forest tracts which are utilised are those of the Jiri forest and the hill slopes lying nearest to the valley. From the hills to the south of the valley, most of the wood used in building is obtained; some of the varieties are said to be proof against the ravages of the white-ant. From a tree found to the north-east in the hills in considerable numbers, a black resinous fluid is obtained, which is used for japanning by the Manipuris. The fir tree is found to be highly resinous, and the trees are of large size. Near the salt wells to the north-east of the valley, on the first low range of hills rising from it are numerous clumps of firs. To the south, the fir is plentiful. Palm trees are found in the eastern slope of the Yomadung range, near Tammu in Burma, where a few supari trees grow; on the Kaopum peak and the Nunjaibong range, where the fan palm is plentiful; and all over the hills on the north and east, where a kind of palmetto is common.

The wood most in request among the Manipuris is one they call U-ningthau. Wild apricot, plum, apple, and pear are common both in the valley and on the hills, and the willow is found in many places in the north.

The Somra basin and the valley to the north of it contain magnificent forests of the *Pinus longifolia*.

The red rhododendron is found all over the hills to the north and a white-flowered kind is found in a few places.

Perhaps the commonest tree about Mao and the southern spurs from Khunho is a tree which both in leaf, fruit, and habitat closely resembles the alder."

The forests between Cachar and the Manipur Valley are managed by the Forest Officer of Cachar, 25 per cent. of the gross receipts being retained by Government on account of management charges. The trees are felled by Nagas, Kukis, Kacharis and Mahimals, and dragged by elephants to the nearest navigable river, down which they are floated to a check station in Cachar. The timber finds a ready market in the Surma Valley. The following trees are exported in considerable quantities : Nagesvar (*mesua ferrea*), jarul (*lagerstraemia flos reginae*), gundroi (*cinnamomum glanduliferum*), rata (*dysoxylum binectariferum*), kurta (*isonandra polyantha*), poma (*cedrela toona*), joki (*bischoffia javanica*) tailo (*castanopsis indica*), sundi, karal (*dipterocarpus sp.*), jam (*schima mollis*), ping (*cynometra polyandra*), cham (*artocarpus chaplasha*), tula, bora, ramdal, haludchaki, gomari (*gmelina arborea*), jhalna (*terminalia bicolorata*), jinari (*podocarpus bracteata*), sutrang, caddum (*anthocephalus cadamba*), dumbhoil and moroi (*albizzia odoratissima*).

CHAPTER V.

INDUSTRIES.

Weaving—Silk—Working in metals—Leather work—Mats—Carpentering—Dyes—Salt—Iron—Limestone—Copper.

THE Manipuris are neat and clever work people, who supply most of their own wants, and much of the clothing used by the hillmen. Were it not for the isolation of the valley, which cuts its inhabitants off to a great extent from outside markets, they could largely add to their resources from their industries. The following is an account of the more important of them.

Weaving. Weaving is a most important industry in Manipur. The cotton employed is grown on the surrounding hills, is sold in the raw in considerable quantities at the various bazars situated in the valley, and is ginned and spun into thread by the women themselves. The processes of spinning, cleaning, and weaving are described at length in the Monograph on the Cotton Fabrics of Assam printed at the office of the Superintendent of Government Printing, Calcutta, in 1897, but the accounts are far too long to admit of their reproduction here. Two kinds of loom are used, the ordinary four-poster loom of the Brahmaputra

Valley and the smaller kind that is used by the Bhutias and other hill tribes of Assam. Description of instruments and of mechanical processes of this nature are of little general interest, and are hardly intelligible unless accompanied by diagrams. Those curious in the matter would do well to consult the monograph to which reference has been already made, where the whole question is discussed in the minutest detail. The four-poster loom and the whole process of weaving is described on pages 80-49, and the smaller loom on pages 77 and 78.

The cloths produced are of excellent quality ^{Cotton} ~~Cloths.~~ and are extraordinarily cheap. Cotton cloth can be bought in the Imphal bazar for less than a half-penny a square foot.* The fabric is a little rough, as home-made fabrics usually are, but it is strong and stout, and weighs an ounce or a little more to the square foot. It is obvious that it would be impossible to produce hand-woven cloths at a profit at such rates with hired labour, but the industry is carried on by the women in their leisure hours, and even the smallest return above the actual cost of the materials is regarded as so much gained. The raw cotton has generally to be purchased, but apart from this there is absolutely no cash expenditure. The loom and other implements of the craft suffer from wear and tear, but the greater part of the loom is usually made at home. Dyed cloths are generally a little dearer, but do not show the dirt so soon, a quality which commends them

* The actual prices paid for two cloths purchased, for certainly not less than ruling rates, was '43 and '53 of a penny per square foot. The former cloth weighed 1oz. per square foot, the latter 1'2 oz.

to the native purchaser. The cotton fabrics offered for sale in the afternoon bazar include *faneks*, or women's frocks, of different colours, though the prevailing pattern is a narrow blue and white stripe, and *dhotis* and coats for men. There are shawls of every size, thickness, and colour, though white is the one most generally in request, and brightly-dyed rugs to catch the hillman's eye. Some of them are white, with red or blue and yellow stripes, some red and blue, and others checks and tartans. On other stalls will be found mosquito curtains and delicate muslin wraps which the women wear over their shoulders when in evening dress. A full list of the cotton fabrics produced in Manipur will be found in the monograph to which reference has been already made, (pages 151-168).

The Manipuri silk-worms are of two varieties, *hanjanbi* and *laimerol*, and differ both from the *pat*, *muga*, and *eri* of Assam and the *tussur* silk of Bengal. Both kinds are reared indoors and are fed on the leaves of the mulberry, or, failing that, on the leaves of two trees called by the Manipuris *wainu* and *lou*. The eggs of the *hanjanbi* take ten or twelve days to hatch, the caterpillar attains its full development in three weeks, when it is above $2\frac{1}{4}$ inches long, and another three days are required for the spinning of the cocoon. The moth hatches out after eight or nine days, and dies shortly after it has laid its eggs. The eggs of the *laimerol*, on the other hand, take nine or ten months to hatch, and the caterpillar two months more to attain to its full growth, when it is about three inches long. The latter variety can only yield one brood in the year, while the former gives some eight or nine,

as it does not breed during the three winter months. The silk of the *laimerol* is, however, superior both in quantity and quality to that of the *hajanbi*. The cocoons are boiled and the thread is then reeled off. Three qualities are recognised. The first is called *muga rel* and fetches about Rs. 18 a seer; the second, *longiai*, sells for Rs. 7-8 a seer; and the third quality, *pangang*, is only Rs. 2 a seer. The worms are delicate and are liable to epidemic diseases which sometimes carry off the whole brood. The principal centres of the industry are Kameng, Khurkhul, Phoyeng, Limareng, Kattumngjan, and Sagalmong. The total annual output is roughly estimated at some sixteen maunds, practically all of which is disposed of locally. Proposals have recently been made by Messrs. Anderson Wright and Coy. of Calcutta for the establishment of the silk industry in Manipur on a commercial scale, but the question is still under the consideration of the Government. The people are intelligent and industrious, and extremely anxious to make money, and anything which would add to their supply of ready cash would add materially to their comfort and do much to facilitate the administration of the State. The silk cloths which were given by the Raja to those of his officers who distinguished themselves in battle are well known. The body is generally green or red, and along each side runs a narrow border of embroidery. At either end there is a deep and very handsome border of silk embroidery, and a fringe of silk. These shawls when new cost Rs. 85, but the colours are then a little crude, and the cloths, like wine, improve with keeping.

**Working in
metals.**

Brass and bell-metal utensils are manufactured in the State, but in the villages they are by no means in general use, and they are not as cheap as most of the commodities of Manipur. Blacksmiths make daos, knives, ploughshares, hoes, and other simple articles. Really artistic daggers with brass sheaths and brass-mounted hilts can be obtained in Imphal. Iron implements can, however, be purchased at Lakhipur in Cachar for far less than they can be manufactured in the valley, and the demand is to a great extent met by imports from this district.

**Stone
vessels.**

Vessels of limestone are made near Bishenpur. A piece of rock is fastened to a spindle which is put in motion by alternately pulling and relaxing a cord wound round it. As the stone revolves a sharp iron tool is pressed against it, and the bowl hollowed out and shaped. A good-sized vessel is sold for two annas, a sufficiently small return on the time and trouble expended.

**Leather
work.**

In the time of Raja Kirti Chandra Singh (1850-1886 A.D.) some Manipuris were sent to Cawnpur to be trained in leather work, and at one time they could tan and work up leather with some skill. The industry has now fallen into decay, and the Manipuris get their leather from foreign *mochis*, and apply a black varnish which is obtained from the juice of a tree called *yang* which grows near the Burmese frontier.

Jewellery.

There are said to be about 100 jewellers in Manipur, most of whom are members of the Kangbun, Torangbun, Koisam, and Kousam castes. The metal is obtained from Calcutta, and the articles prepared include necklaces, rings, bracelets and anklets, earrings, cups, dishes,

and pan cases and head ornaments. Manipuri jewellery is generally cheap and showy and often consists of baser metals overlaid with the thinnest washing of gold. Brass bracelets and armlets are also manufactured for the hill tribes.

The Manipuris are expert makers of different kinds Mat-making and baskets. of mats and baskets. The *kaunafak* which is used for sitting or sleeping is made from the *kauna* reed. The *iangdowfak* is a mat on which paddy is generally threshed and is made from *nal*. The *toufak* is also made from *nal*, and is a large mat which is used to make the bins in which paddy is stored. The *lah* and the *faklong* are two mats made of split bamboo. The same material is generally used for baskets, some of which are very neatly made, especially the *tappus* and *polans* or baskets in which the hill-men carry their loads.

The men are clever carpenters and will turn out ex- Carpentering, pottery, &c. cellent European furniture from a pattern. Neat carving is also done in horn and ivory, but these arts are at present in a very languishing condition owing to the absence of court patronage, though that perhaps is hardly the right term to use. The pottery of the country has not much to recommend it except its cheapness. Water jars and other vessels are manufactured, the principal centres of the industry being Chirel and Nangul. Good bricks are manufactured in the State, and excellent tiles were made by men who had received a lesson from the tile-makers of Upper India.

Various kinds of vegetable dyes are found in Mani- Dyes and dyeing. pur which are freely used by the inhabitants of the State. The best authority on the subject is a Monograph on

Dyes and Dyeing in Assam by Mr. W. A. M. Duncan, published at the Shillong printing office in 1896. A full description of the various dyes and of the way in which they are used will be found in that work, and all that is necessary here is to give a list of the dyes found in Manipur, showing against each the Latin and the Vernacular name and the page of the monograph on which they are described. *Acanthaceae* (*khujum pereh*) used in conjunction with safflower, page 9; *Bixa Orellana* (*urei rum*) red or orange, page 14; *Carthamus Tinctorius* (*kusum*) pink or rose, page 17; *Fagopyrum Esculentum*, yellow, page 24; *Fibraurea Trotterii* (*napu*) yellow, page 25; *Garcinia Pedunculata* (*heibung*) a mordant, page 26; *Perilla Ocimoides* (*thoiding*) black, page 40; *Quercus Fenestrata* (*kuhi*) black, page 42; *Quercus Pachyphylla* used for dyeing and tanning, page 42; *Rubia cordifolia* (*moyum*) red, page 44; *Rubia Sikkimensis* (*moyum*) brilliant red, page 46; *Strobilanthes Flaccidifolius* (*Khuma, Khum, Kum*) for dyeing silk, page 48; *Symplocos Racemosa* (*Kairang*) mordant, page 50; *Tectona Grandis* (*chingjagu*) black, page 52.

Salt.

Salt is the mineral deposit which is of most importance in Manipur. The following description of the salt wells which was given by Dr. Brown in 1869 is still correct at the present day.*

Sources of
supply:
wells.

The principal wells are situated at the foot of the hills to the north-east, about 14 miles from the capital; they are four in number, and are named as Ningel, Chandrakhong, Seekong and Waikhong; they all lie close together, and are surrounded by villages wherein reside those engaged in the salt manufacture.

* Page 22.

Wells have been opened in other parts of the valley, but the supply has not been remunerative.

Last year I paid a visit to two of the principal wells, Ningel and Chandrakhong, and the following description of the mode of manufacturing the salt, &c., may prove of interest: Ningel has three wells, all contained in a somewhat elevated dell of small dimensions, surrounded by a low range of hills covered with grass and scrub.

Description
of the salt
wells.

It is stated by the Manipuris that the situation of an underground salt spring is discovered by the presence of a peculiar mist seen hanging over the spot in the early morning. When the sinking of a well is determined on, large trunks of trees are prepared by hollowing out into cylinders, which are sunk gradually until the water is reached. In the Ningel wells the depth at which water is found is about 35 to 40 feet and the wooden cylinders rest upon rock, the intervening stratum consisting chiefly of loose earth and boulders. In the oldest of the three wells at Ningel in which the cylinder has been sunk, it is said, for about 100 years, the wood has become entirely petrified throughout its whole substance, which is more than a foot thick. The others are only partially petrified, they being newer, and the supply of water being less.

How dis-
covered and
constructed.

The soil and vegetation surrounding the wells shows nothing peculiar, and there is no appearance of any deposit of salt on or near the surface.

Appearance
of soil and
vegetation
near wells.

The water is drawn out by wicker buckets and emptied into large earthenware *ghurrahs* or hollowed-out trunks of trees placed by the side of the wells, from whence it is carried in smaller vessels to the boiling down sheds, situated some distance off. The water, as it is drawn, is quite clear, but from its being stored in mud tanks in the sheds, it soon becomes very dirty: this could easily be avoided, but the Manipuris do not seem to object to impurity, and it is positively relished by the hill-men.

Manufac-
ture of salt.

There are in Ningel, to which this description applies, three boiling-down sheds, nearly always fully employed. The salt water is evaporated in small earthenware dishes, shallow and saucer-shaped. Before the water is poured into them they are lined with plantain leaves, to which the salt adheres, and the contents, when the salt has filled the dish, are thus easily removed. The pans, about 100 in number in each shed, are placed over little holes, and underneath is the fire, which is stoked at one end, the fuel used, as in the Sylhet lime kilns, being dry reeds. The attendants are constantly on the move supplying the pans with water, emptying, and filling them again.

Evaporation
of the salt
water.

Chandra-
khong salt
wells.

The Chandrakhong salt wells, two in number, are much the same as above and somewhat similarly situated, in a village about a mile to the north-west of Ningel. There is one peculiarity worth noting in Chandrakhong, that is, the existence of a

Fresh-water
well in
Chandra-
khong.

fresh-water well in close proximity to the salt ones: this well requires constant pumping to prevent its diluting the salt water in the other wells; it would appear from the existence of this fresh-water well that the very edge of the salt deposit at this place has been struck in sinking. The salt water here does not seem to have the same petrifying power as that of Ningel, and the same observation holds good with regard to the other wells.

Other wells.

The other wells present no peculiar features. Seekong has four wells, Waikhong five; from this well a superior quality of salt is obtained, which is set aside for the Raja and his immediate retainers: it can, however, also be procured in the bazars at a slight advance on the price of the commoner sort: it only differs from it in being cleaner.

Ningel, the
oldest well.

Ningel is the oldest of the wells, and has always given the greatest yields.

In the days of native rule, salt was an important source of revenue. Foreign salt was scarce and costly, and the Brahmans were encouraged to declare that it could not be taken by a Manipuri without loss of caste. The industry was carried on by slaves, or by forced labour, but the work is hard and, when the *corvéé* or *lalup* was abolished, difficulties were experienced in obtaining labour. The opening of the cart-road has cheapened foreign salt, which in January, 1905, was selling in Imphal bazar for seven pice a seer, as compared with the four annas charged for Manipuri salt. The old market women sometimes consult the feelings of the more conservative of their customers by mixing this foreign salt with a little dirt, and selling it in cakes similar in form to the cakes of Manipuri salt. The last few years have shewn a serious decrease in the salt revenue of the State. In 1892-98, Rs. 13,800 were received

under this head; in 1908-04 the receipts were only Rs. 5,800. The wells in the valley are put up to public auction. In the hills, iron cauldrons are supplied by the State, for each of which rent is levied at the rate of Re. 1 per mensem.

Iron is found in the shape of small pisolitic nodules of hydrated oxide of iron intermixed with clayey matter. The best deposits have been discovered at Kameng, Kakchingkulen, and Kakchingkuna, and are generally at a depth of four or five feet below the alluvium. The Manipuris used to dig up these particles of ore, and after washing away the earthy matter, heated them in a fire of straw till they became red-hot. The ashes were winnowed off, the ore pounded till it was reduced to powder, and the powder smelted in a charcoal fire. It is said that the industry is now practically extinct and that foreign ore is almost invariably used by the local blacksmiths. Iron.

There are small deposits of limestone near Shugunu and Bishenpur, but larger quantities are found about 85 miles north-east of Imphal on the road to Ukrul. Limestone.

Copper is found in the south-east corner of Manipur, between Moreh thana and Yangpopki, but is not worked. Coal has not yet been discovered in the valley. Good building stone is quarried from the hills. In Imphal itself there are some low hills which contain an unctuous clayey rock, which is eaten by women when in an advanced stage of pregnancy. Copper and coal.

CHAPTER VI.

ECONOMIC CONDITION OF THE PEOPLE. COMMUNICATIONS AND TRADE.

Rents and wages—Prices—Famine—Food—Houses—Furniture—Dress—
Economic condition of people—Communications—Post and Tele-
graphs—Commerce and trade—Development of cart traffic.

Rents and
wages.

LAND is sublet by Brahmans and Rajkumars, and other residents of Imphal town. The usual rate charged is 18 maunds of unhusked paddy per *pari*,* which, at Manipur prices, does not very greatly exceed the revenue assessed by the State upon the land. There are no statistics available to show the area of land sublet.† The Manipuri villagers will combine to help one another to cut and carry the harvest, but think it degrading to take service with other Manipuris, though they do not object to working for foreigners. Poor people will, however, sometimes take an advance of Rs. 80 or 40, in return for which they will work without wages as domestic servants, their labour being set against the interest on the loan

* A *pari* = 2½ acres.

† The information is available in the land revenue registers, but it has never been compiled.

While they are living with their masters they are treated in all respects as humble members of his family. They are fed and clothed, and arrangements are even made to provide them with wives or husbands. Wages, when paid, are low, but so is the cost of living. A boy will come for as little as one rupee a month, and a grown man will be content with four or five rupees. Domestic slavery was in existence in the days of native rule, but the slaves were generally treated with kindness and consideration, differing from servants only in that they received no wages. Slavery is no longer recognised, and, though the servants whose work is set against the interest of an advance that they will never be able to repay are not unlike the old domestic slaves, there is this important difference that, if they choose to leave their masters, they cannot be recovered. Nagas when employed as coolies, except on the road to Lakhipur and Dimapur, receive four annas a day.

The prices of rice and the natural products of Mani- Prices. pur are extraordinarily low. In January 1905, common rice was selling in the Bishenpur bazar at 15 annas a maund, and unhusked rice was only 5 annas 4 pie a maund. These prices are in no way exceptional, though in Imphal, 18 miles away, they are generally a little higher, and the price sometimes rises a little in the middle of the rains. Prior to the opening of the cart road, salt used to be very dear, and in 1895, only three seers were procurable for a rupee. In 1902, the price fell to $5\frac{1}{2}$ seers, and in 1904, eight seers could be bought for the rupee. Pulses are not very cheap, as Manipur is not a great pulse-producing tract, and the market is subject to considerable

fluctuations. In February 1901, 17 seers of matikalai were to be had for a rupee, but in the same month, three years later, the price had fallen to 9 seers. The normal price seems to be about 11 seers for a rupee. Further details with regard to prices will be found in Table V. Hand-made cotton cloth is also extraordinarily cheap, and in the Manipur bazar stout cotton cloth can be bought at a half-penny the square foot. The one article of daily use that is dear in Manipur is the areca-nut, as it has to pay a heavy charge for transport. The usual market rate is from three to four pice a dozen, and as a Manipuri will often eat twenty in a day, it forms a serious item in the family budget.

Famine.

Manipur has not actually suffered from famine within recent years, but no less than twice the condition of affairs was grave enough to be the cause of some anxiety. Much of the grain that had been reaped in the winter of 1890-91 was destroyed in the disturbances that took place, and, between August and November 1891, more than half the population were subsisting on a single meal a day, and began in consequence to show signs of emaciation. In 1896, there was again a scarcity due to the poor harvest reaped in 1894-95, and to the export of rice to Kohima along the cart road. In the middle of August, rice was practically unobtainable, and the price went up to Rs. 10 per maund. Fortunately the harvest was a good one, and, by the end of December, the price had fallen to Rs. 2-4, though that was very high for Manipur. It is far from likely that actual famine ever would occur, and the high prices asked in 1896 probably merely meant that no one had any surplus grain

to sell. The difficulties of supplying the State from outside would, however, be immense, as all the grain would have to be carried 184 miles from Dimapur, along a road which at present has to be closed to cart-traffic in the rains.

The staple food of the Manipuris is rice, of which they **Food.** consume unusually large quantities. With their rice they generally take a dish of curried chillies, and they are very partial to dried fish, the local supply of which is supplemented by imports from Cachar. They also take milk, molasses, potatoes, and other vegetables, and are very fond of the areca-nut. The areca-palm unfortunately will not grow in Manipur, and many tons of these nuts are carried into the valley every year across the seven ranges of mountains that divide it from Cachar. *Ghi* they dislike, and flesh of every kind they eschew, denying themselves even the venison which is permitted to the Mahapurushiyas of Assam. They prefer their fruit as a rule unripe, and are very partial to lemons. There are two articles of diet, the *thoru* and *yungchak*, which are not usually seen outside Manipur. The *thoru* is an aquatic plant whose roots are eaten raw, and are rather like cocoanut though with a much fainter flavour. The *yungchak*, or monkey rice, resembles a gigantic pea pod. It is generally about one foot long but is very thin in proportion to its length.

The ordinary Manipuri house is always built after **Houses.** the same pattern. It is raised a foot or so above the ground on a neat mud plinth, and is very long in proportion to its breadth; a typical house being 50 feet by 17. The front part of the dwelling consists of a porch

or deep verandah about 15 feet in depth, with walls on either side. It is kept scrupulously clean, and acts as a sitting-room for the family; but, if a European so much as puts his foot upon the plinth, the whole of the house will forthwith be abandoned. The posts and beams in the better houses are made of wood, the roof of thatch, the walls of split bamboo plastered over with mud. But what strikes a visitor from the Assam Valley is the extraordinary neatness of the whole building. There are no holes in the walls where the mud plaster has fallen off, the floor and walls of the porch are scrupulously *leaped*, the door is made of timber and is set in a neat frame of wood, and the whole place looks like the home of a man who takes a pride in himself and his surroundings. In front of the house is a piece of level ground which is carefully plastered with mud and cowdung, in the centre of which there is the sacred *tulsi* plant. Here the Manipuri offers up prayer to Heaven, and paints his caste mark on his forehead after taking food, and in the winter time he generally protects the shrub from frost by erecting over it a light shed of bamboo and thatch. Opposite the house there is a cowshed, or, in wealthier houses, a well-built barn with no wall on the side which faces towards the house. This is used as a sitting-room when guests are too numerous to be accommodated in the main dwelling, and as a place in which looms and similar articles of furniture can conveniently be stored. The premises are generally surrounded by a stout mud wall some four feet high, from which tall *ikra* shoots and effectually secures seclusion for the family. There is often too a hedge of bamboo round the garden, which is much more

neatly kept than the compounds of Assam. There is very little jungle, and the ground is covered with vegetables, tobacco, sugarcane, and even mustard and pulse. Such is the typical house in Imphal, and the houses of the villagers are built on the same plan, though they are smaller and generally not so neat.

But though the houses are well made, the furniture Furniture. is, as a rule, extremely simple. Many people eat off plantain leaves, and in the house of the ordinary villager there are few brass or bell-metal utensils. This, perhaps, is due to the desire of being saved the labour of keeping the metal vessels clean, as the plantain leaf is simply thrown away after use, and the disagreeable process of washing up is thus avoided. The article of furniture in which the Manipuri takes most pride is his bed. The bedstead is made of wood, and in rich men's houses is very neatly carved. On this is placed a mattress, and the thickness of this mattress is a good clue to the wealth and position of the owner. A rich man's mattress is sometimes fully two feet thick, and is covered with a piece of red woollen cloth and a long-cloth sheet broad enough to reach to the ground on either side. For bed clothes they use blankets and Manipuri quilts, and the size of the mosquito curtains is another index of the prosperity of the owner of the house. At the side of this bed a mat is spread upon the floor on which either husband or wife sleep when they are ill, as it is thought that a sick man would be subject to attacks of vertigo if raised above the ground. Apart from this, there is very little in the way of furniture. There are mats and baskets, and perhaps a box or two in the houses

of the poorest, and well-to-do people will have a few chairs and tables, but chairs do not, as a rule, commend themselves to the Manipuri.

Dress.

The Manipuris are a well-dressed people, and even when their wardrobe is not large they try to look as clean and smart as possible. The ordinary dress of a villager is a *dhoti* and a sheet, but in Imphal town shirts and coats are coming into use. In the cold weather most men use a padded cotton quilt as a wrap, and padded coats are also sometimes worn. The ordinary dress of a woman is a cloth called *fanek* folded round the bust and reaching to the feet, while a cotton shawl is thrown over the head and shoulders. In addition they sometimes wear a short jacket which is often made of satin or velvet. The *faneks* are generally made of a striped material, and have a neat border at the top and bottom of embroidered silk. They are, however, strained tightly across the bosom and thus completely spoil the shape of the bust. On *gala* days the *faneks* of the well-to-do are of a bright and pretty pattern, and across the shoulders girls wear nothing but a gauzy wrap of delicate and transparent muslin; a costume which is not unlike a rather low-cut Empire gown. In the days of the late Rajas special merit was rewarded by the right to wear a particular kind of coat or cloth. The silk shawls bestowed on those who distinguished themselves in battle are extremely handsome. The body is red or green, and at either end there is a very deep border of embroidered silk. Men generally wear their hair short, with the exception of the little lock at the back of the scalp which is preserved by all devout Vaishnavites. Unmarried

girls wear their hair long behind. In front it is plastered down over the forehead in a deep fringe which reaches almost to the eyebrows; and, not content with this, they let it hang in a sort of fringe at the side of the head over the cheeks and ears. The effect is thus exactly that of an Egyptian mummy. When a girl is betrothed, this fringe cannot be cut without the consent of the future husband. Married women let their hair grow, and turn it back and knot it over the nape of the neck after the fashion that is usually in force in Eastern Bengal; but here again the husband's rights come in, and he must be the first person to turn back his wife's hair.

Though to outward seeming unusually prosperous, the Manipuris are not really very well-to-do. They live in good houses and are always clean and neatly dressed, but the great majority of them have very little cash. In few places is nature more bountiful than in Manipur, but owing to its isolation the inhabitants are unable to find a market for their produce. The problem that presses most urgently for solution is the introduction of capital into the valley. While heavy expenditure was being incurred on public works, the people had little difficulty in obtaining cash to pay their land revenue, but this source of income has now been considerably curtailed. Given a market, the Manipuris could easily grow rich; but with rice selling at 15 annas a maund, and stout home-made cotton cloth at $\frac{1}{2}d.$ per square foot there must evidently only be a small margin of profit. At the same time there is not much indebtedness, the foreign traders being far from certain whether they would recover any advances they might make.

*Economic
condition of
people.*

Communica-
tions.

There are three roads which connect the town of Imphal with the outside world; the cart road over the Naga Hills to the Assam-Bengal Railway at Dimapur which has a total length of 134 miles; the bridle path to Cachar *viâ* Bishenpur and Jirighat; and the bridle path *viâ* Thobal to Tammu, and thence across the Kubo valley into the valley of the Chindwin.

The cart road enters the Manipur State at Mao thana, which is 67 miles from Dimapur and nearly 5,600 feet above the level of the sea. From there it descends steadily along the contours of the hills, and the next bungalow at Maram, 18 miles from Mao, is only 4,596 feet above sea level. From Maram to Kairong bungalow there is a drop of 1,200 feet in a distance of 18 miles. The road at this point crosses the upper waters of the Barak, which, though but a shallow stream in the cold weather, comes down in heavy spate during the rains. Even when in flood the river is hardly more than four feet deep, but the current is so swift that it is impossible for a ferry to be worked, and carts are sometimes detained for four or five days till the violence of the stream abates. Foot passengers can cross by a light suspension bridge, and a fine bridge capable of carrying heavy traffic is now (1905) in course of construction. From Kairong the road gradually rises to the Maiangkang watershed some 500 feet above the valley, and then drops again to Kangpokpi, 18 miles from Kairong. The next stage is to Kanglatombi 18 miles, and from there it is 15 miles into the town of Imphal. All of the staging bungalows are built of stone, contain three rooms, and are not only furnished with beds, tables, and chairs, but are supplied

with glass and crockery. Only about 85 miles of the road between Imphal and Mao thana are metalled.

The hills through which the road has been carried are largely composed of soft grey shale, and the unmetalled portions become so bad after wet weather, that during the rains the road is sometimes closed to cart traffic. The whole of this road is still under the charge of the Assam Administration, but the State makes an annual contribution of Rs. 30,000 towards its maintenance.

The first 17 miles of the Cachar road from Imphal The Cachar
bridle path. past the Foiching rest-house (9 miles) to the Bishenpur bungalow, lie along the valley and are drivable, but at Bishenpur the road turns sharply to the east and sinks to the status of a bridle path. The stage from Bishenpur to the next bungalow at Laimatak is only 18 miles in length; but the traveller has to ascend nearly 2,000 feet to the summit of the Laimatol range and then drops nearly 8,500 feet to the Laimatak river. The next halting place is at the Kaopum, 12 miles further on over the Loangba range, which entails a climb of 2,700 feet and a descent of 2,000 feet the other side. Then comes a comparatively easy march of nine miles to Irang. To the summit of the Kaopum range it is only a climb of 500 feet, but on the other side there is a drop of 2,800 feet in less than four miles. After leaving the Irang bungalow, the path crosses the Irang range (1,960 feet above the level of the sea), drops to the Lengba stream, and then climbs once more to the Nongba rest-house which is 2,710 feet above mean sea level and 12 miles from Irang. From Nongba there is a march of 18 miles, the greater part of which is on an easy downward slope to the bungalow in

the valley of the Barak. The next stage is only 11 miles in length, but the path mounts 2,600 feet to cross the Kala Naga range, and descends nearly 3,000 feet to the Makru bungalow on the other side. From Makru it is a march of 15 miles with a climb up and down of 1,600 feet to Jirighat, the frontier of Manipur, whence it is another 24 miles to Silohar town. The path thus crosses seven ranges of hills and five main rivers, and in the course of 85 miles the traveller from Manipur has to ascend altogether over 12,000 feet and descend rather more than 14,000 feet. Nearly all the rivers along this road are crossed by wire suspension bridges, with the exception of the Jiri, over which a ferry is maintained.

The Tammu
bridle path.

South south-west of Imphal runs the road to Tammu on the Burmese frontier. There are staging bungalows at Thobal on the 14th, and Palel on the 19th mile, and for the first 81 miles the road is drivable. From there to the Burmese frontier there is nothing but a bridle path, and beyond Aimol on the 85th mile there are no rest-houses. From Tammu it is only 24 miles across the Kubo Valley and a range of hills to Sittang on the Chindwin river.

The only other driving roads in the Manipur valley outside Imphal are the continuation of the Bishenpur road to Moirang, and the road to the foot of the hills below Kangjupkul. None of these roads are metalled, with the exception of the road to Dimapur, and are thus liable to be much cut up if required to carry heavy traffic in the rains. The rivers are generally crossed by wooden bridges, and as the timber is of poor quality and soon rots if exposed to the action of the weather, it is found

cheaper to cover them with a roof of thatch, a custom which gives them a somewhat singular appearance.

There are only two post offices in Manipur which are situated at Imphal and Mao thana. Two lines of post are maintained by the State, to Kohima which is reached in about 40 hours, and to Tammu which is reached in about two days. Government also keeps up a line to Silohar which is reached in 50 hours. The mail is carried in each case by runners. Between Kohima and Imphal the runner carries what is known as an "open bag," so that letters can be received and posted by any person travelling along the road. A telegraph line crosses the Naga Hills, passes through Imphal, where there is an office, and enters Burma *viâ* Tammu.

The internal trade of the State is carried on at markets held in the open air, and outside Imphal such a thing as a permanent shop is practically unknown. Even in the town itself there are only 36 shops, 29 of which are kept by the shrewd merchants of Marwar. The principal articles offered for sale at these shops are cotton goods and thread, umbrellas, brass and bell-metal utensils, oil and fancy goods, with flour and other kinds of grain. Foreigners are not allowed to open shops in the interior, and the Manipuri, though he is fond enough of trade, is not a shopkeeper. Markets are, however, held all over the valley which are largely attended by the villagers. In Imphal itself there are no less than 18, but all are completely overshadowed by the great afternoon bazar. The day bazar is situated near the brick bridge over the Nambol, and is a very respectable market as markets go. The afternoon bazar is only a few hundred yards west of

Post and
Telegraph.

Commerce
and trade.
Internal
trade.

the morning bazar, and is held on a fine level piece of ground in which there is ample elbow room. This is, no doubt, the reason for the change of site, for to the casual visitor it at first seems strange that the business centre of the town should be shifted a few hundred yards just at the close of day. At 8-30 P.M. the place is absolutely deserted. There are the fifty-five low plinths on which the women sit, but there is nothing to suggest that this is a place of business, and the casual visitor could easily imagine that he was looking at the site of rows of unfinished cooly lines. An hour-and-a-half later the place is white with people. There are from 2,000 to 8,000 women sitting behind their wares, and the throng of purchasers is even larger. The prices are extraordinarily cheap and the articles offered for sale most miscellaneous in their character. There is cotton in the raw, cotton thread, creepers that are used as dyes, and enormous quantities of cotton cloths of different colours and patterns. There are cotton-padded quilts and coats, hats, and shoes, and various other articles of dress. Excellent specimens of brass work are on sale, in addition to the sickles, daos, and hoes that the cultivator needs. Mattresses are there, bamboo mats and baskets, jewellery, and pottery. In addition to all these miscellaneous articles, there is a large store of grain of various kinds, fruit, vegetables, poultry, salt, and all the different kinds of food that are generally to be found in a market in Assam.

The Imphal afternoon bazar is held just in front of the old gate into the *pat*, and in former days there was a curious custom under which ten of the Raja's servants

used to take from the market women sufficient supplies to last them for one day. Needless to say these supplies were never paid for, and this irregular toll was felt to be a serious grievance. Efforts were made from time to time to induce the Raja to forego his claim, but it is doubtful whether the custom was ever really allowed to fall into disuetude, and the women are still afraid that it may be revived as soon as the State is placed again under native management. There are very few sheds in any of these bazars, and the market-place consists of rows of plinths on which the vendors sit. In rainy weather each woman brings her own umbrella and plants it in the ground in front of her. Men very seldom sell at these bazars and do not often attend even as purchasers.

The following is a list of the places outside Imphal, ^{Bazar- out-}side Imphal where bazars are held :—

Mayang Imphal.	

Tea seed and buffaloes are imported from Burma, but ^{Foreign Trade.} most of the trade of the State is with Cachar and the Assam Valley. The principal exports to Cachar are cattle, and timber and other forest produce from the State forests on the western frontier. Tea seed was at

one time an important article of export, and in 1896-97 was valued at about Rs. 1,75,000. Almost the whole of this seed came originally from Burma, so that the State suffered comparatively little loss when the depressed state of the tea industry put an end to the trade. Tea seed was, however, a source of considerable revenue to the Raja in the days of native rule, as he kept the monopoly of it in his hands.

The principal imports are cotton piece-goods and yarn, dried fish, and betelnuts. Rice is exported in considerable quantities along the cart road to Dimapur, and, were it not for the fact that all traffic is at present suspended in the rains, the trade would probably be considerably larger. At the same time it must be borne in mind that, cheap though rice is in Manipur, it has to bear a heavy charge on account of freight; and when prices are as cheap in Assam as they were at the beginning of 1905, there is very little profit in the business. The principal imports by this route are cotton yarn and piece-goods, kerosine oil, *ghi*, salt, and sugar. The following statement shows the average value of the principal exports during the past three years to and from Cachar and Assam. Statistics for Cachar are registered at Jirighat, and at Mao thana for Assam.

Develop-
ment of cart
traffic.

Trade with Assam has been enormously facilitated by the opening of the cart road, and by a development of the cart traffic, for which it would be very hard to find a parallel in Assam. The first carts to enter Manipur were sent up in 1896. Rs. 50 was offered for each cart from Nigriting to Manipur, and the owners were certain of a large profit on the load of rice which they could bring back on the homeward journey. In spite of these

liberal terms, scarcely a man was willing to undertake the work. Six or seven years later there were over 1,700 carts registered as plying between Imphal and Dimapur. Sylhet has had excellent cart roads for many years, yet there is hardly a cart to be hired in the district; and it is difficult to recall a single industry in Assam which has been developed by the natives of the Province with such remarkable rapidity. The Manipuris are, however, a very imitative people, and, like the Khasis, are willing to give any novelty a trial. The art of making carts and cart wheels was speedily acquired, cattle in Manipur are cheap and good, and in a surprisingly short space of time a flourishing transport business was established. Freights are in consequence unusually low, and the charge for sending a maund of goods the 184 miles from Dimapur to Imphal is only eight or ten annas in the dry weather. From Imphal to Dimapur the rates are generally higher and are seldom less than Re. 1-8 per maund.

CHAPTER VII.

GENERAL ADMINISTRATION.

Land revenue—Lalup—Revenue administration since 1891—House tax—
Fisheries—Other sources of revenue—Criminal and Civil Justice—
Punishments—Police and jails—Education—Medical aspects.

Land Re-
venue.

THE following description of the way in which land revenue was realized in the days of native rule is taken from the work by Dr. Brown :—

“ The whole land system of the valley starts with the assumption that all the land belongs to the Raja, and is his to give away or retain, as he pleases. Under the Raja is an official, named the Phoonan Saloomba, whose duty it is to superintend all matters connected with land cultivation. He looks after the measurement, receives the rent in kind, and transacts all business matters connected with land on behalf of the Raja. The land is subdivided into villages and their surroundings : the headman of each division or village looks after the cultivation, and is responsible for the realisation of the tax payable in kind by each cultivator ; he holds no interest in the land, and is merely an agent of the Raja.

Besides the land thus directly, as it were, cultivated for the Raja, grants of land are given to officials and favourites, sometimes for their own lives only, or for a specified time, sometimes for themselves and descendants. These hold their lands on payment of the usual tax in kind. Connections of the Raja, Brahmans, and sepoys, pay no rent or tax on a fixed proportion of land regulated in each case, but on any increase on the land cultivated above that proportion rent is paid.

The proportion of land cultivated under what may be called the direct system on account of the Raja is about a third

of the whole; rather more than a third is in the possession of members of the ruling family, Brahmans and sepoys; the remainder is in the hands of the headmen, officials, etc., who hold it by favour from the Raja. Each individual liable for *lalup* or forced labour for the State, is entitled to cultivate for his support one *pari* of land, subject to the payment of the regular tax in kind.

The tax in kind realised from each cultivator, and which goes to the Raja, is liable to many modifications, although in theory the tax is a fixed one. The tax as given by McCulloch varies from two baskets to thirteen from each *pari*.^{*} I am informed that the two baskets, which nominally should only be taken from everyone alike, is realised from favourites, and that the average from others may be set down at 12 baskets yearly: this is seldom exceeded, except in rare emergencies, as war, &c. This, again, will only apply to land cultivated for the Raja or held by those subject to *lalup*. In cases where lands are held by officials, etc., as middlemen, the burdens are more severe, running as high as twenty-four baskets per *pari*, which I am informed is the outside limit. The average yield per *pari* is about 150 baskets annually; each basket contains about 60 pounds."

In addition to this tax in kind each male between 17 and 60 was supposed to render to the State ten days' labour out of every forty. The people seem to have been divided into different guilds, to each of which was allotted the duty of providing some particular article of use or luxury required by the Raja and his numerous retinue. Some, for instance, would build the roads and bridges; to others would be assigned the various crafts, the manufacture of brass or bell-metal utensils, of jewellery, or of leather work. Others again would be deputed to the personal service of the Raja and his followers. A list of the different guilds, as recorded by Dr. Brown, has already been printed on page 55. A similar system was in force amongst the Ahoms, and, were it not for the difficulty of checking abuses in the working, it is a system

The *lalup* or
corvée.

* A *pari* = 2½ acres.

which is not entirely unsuited to the conditions of life upon the North-East Frontier. Labour is the one thing in which the inhabitants are really rich ; it is the one thing that can be taken from them and leave them no poorer than before. Nearly every man sits idle for a considerable portion of the year, and the native rulers did not hesitate to avail themselves of this great store of potential labour which now unfortunately goes to waste. It does not appear from the reports of either Brown or McCulloch that the people found the system of *lalup* particularly irksome or oppressive, though in the case of the Manipuris it was combined with a much heavier tax in kind than was levied from the subjects of the Ahom kings. Major-General Sir James Johnstone, a former Political Agent of Manipur and an officer who was full of sympathy with the natives of this country, described the *lalup* system in the following terms and much regretted that it was entirely abolished not only in Manipur but in Assam :—

“The system was a good one, and when not carried to excess, pressed heavily on nobody. It was especially adapted to a poor state sparsely populated. In such a state, under ordinary circumstances, where the amount of revenue is small, and the rate of wages often comparatively high, it is next door to impossible to carry out many much-needed public works by payment. On the other hand, every man in India who lives by cultivation, has much spare time on his hands, and the ‘*lalup*’ system very profitably utilises this, and for the benefit of the community at large. I never heard of it being complained of as a hardship. The system in Assam led to the completion of many useful and magnificent public works. High embanked roads were made throughout the country, and large tanks, lakes, appropriately termed ‘*seas*,’ were excavated under this arrangement. Many of the great works of former ages in other parts of India are due to something of the same kind.

It was a sad mistake giving up the system in Assam without retaining the right of the state to a certain number of days' labour on the roads every year, as is the custom to this day, I believe, in Canada, Ceylon, and other countries."*

When the State came under British administration the system of *lalup* was abolished. Under the Raja the people were compelled to attend at Imphal, but very little supervision was exercised over the tale of work, and half of them, perhaps, sat idle. The more business-like arrangements of the British put a stop to all this loafing, and thus produced considerable discontent. This discontent took a practical and very objectionable form, and the people began to emigrate to Cachar, a thing which had not been allowed in the days of native rule. *Lalup* was accordingly abolished, and in lieu of it, a tax of Rs. 4 per *pari* was assessed on all settled land in the valley. In 1898-94, this rate was raised to Rs. 5 per *pari* or Rs. 2 per acre. Though low enough in itself, the assessment is probably quite as high as the peculiar economic conditions of the State permit. In 1904, Lieutenant-Colonel Maxwell, who had been Superintendent of the State since 1891, reported that rice was so cheap that it hardly repaid the cost of cultivation, with the result that some difficulty was occasionally experienced in obtaining the money required to pay the revenue. When the State first came under British administration, the land was managed directly from the Superintendent's office. This was, however, but a temporary expedient, and in 1894, the valley was divided into four

Revenue substituted for *lalup* after 1891.

* "My Experiences in Manipur," by Major-General Sir James Johnstone, page 114.

pannas or tahsils, each of which had a revenue demand of about half a lakh of rupees. The tahsildars, or *lakpas*, received a commission of 10 per cent. on their collections, but were required to defray the charges of their establishments, which amounted to between Rs. 1,800 and Rs. 1,700 per annum. A tax of Rs. 2 was levied on each homestead, the garden ground was not assessed to revenue, and a staff of eight amins, under an official known as an Amin *Lakpa* was engaged in measuring up the land.

The measurement of the valley.

Experience showed that the *lakpas* required much closer supervision than so small a staff could give them. At the end of three years, the arrears, good and bad, amounted to no less a figure than Rs. 86,000, or about one-third of the total land revenue demand, and it was obvious that some reform was necessary. The size of the *pannas* was accordingly reduced by the erection of Imphal into a separate *panna*, the *lakpas* were relieved of all work connected with the settlement of new land and the registration of titles, and a Sub-Deputy Collector was appointed with a staff of four kanungos and forty amins to measure up the valley. The measurement was made on the non-cadastral system with a rod, and was completed by March 31st, 1899. After deducting the homestead land which was still assessed to house-tax, it was found that the assessed area had risen from 255,000 *bighas* to 320,000 *bighas*, an increase by re-measurement of no less than 65,000 *bighas*. The survey staff was then reduced to twenty amins under two kanungoes working under the general direction of the Sub-Deputy Collector. In the following year the house-tax was

abolished, and the homestead land was measured up and assessed to revenue at the ordinary rate; a measure which produced a small increase of 4 per cent. on the previous revenue demand.

The principal registers on which the land revenue assessment is based are the *dag-chittas* which record the name of the occupant of each field, and the *jamabandhis* which show the number of fields included in each *patta*. The *patta* or lease confers no title to the holding, but in practice, when land is taken up for purposes of State, it is customary to give the owner compensation. Land is also bought and sold and mortgaged as though the occupant had a valid legal title. For estates which pay more than Rs. 10 in revenue, the revenue is due in two instalments, one-half on January 15th, one-half on March 15th. The revenue on smaller estates is paid in one instalment on January 15th. Revenue is collected by *Lakpas*, who move about through the areas committed to their charge. It was at one time thought that these tours were the cause of some inconvenience to the people, as they were compelled to support the *Lakpa's* large and sometimes needy retinue; and in 1902-08, they were ordered to remain at their headquarters. Experience showed that the Manipuri would not come in to pay his revenue unsolicited, and the system of touring had to be revived. The Manipuris are allowed to resign their land, provided that they give notice to the land revenue authorities on or before December 31st. During the last three years, the average area of land resigned and of new land taken up was 2,049 and 8,248 acres respectively. Further details with regard

to land revenue will be found in Table VII. There is still a considerable area of uncultivated land in the valley. In many cases, however, some capital expenditure would be required either to drain it, or to bring more water on to it, before it would be fit for cultivation. The principal obstacles to the extension of cultivation are scarcity of labour and the low price of rice, which does not offer sufficient profit to stimulate the villagers to further exertions.

House Tax.

Amongst the hill tribes a tax of Rs. 8 is levied on each house, and no attempt is made to measure up the area under cultivation. The hills are divided into five *lams*, each of which is in charge of a Manipuri official called a *Lam* subadar, assisted by some eight Manipuri *lambus* or peons. In the north, there is the Mao *Lam*, and the Tankul *Lam* includes the hills along the north-east of the valley. South of the Tankul country is the Tammu *Lam*; the Moirang *Lam* is in the south-west corner of the State, and the Kapui *Lam* to the north of it. The hill man, like other savages, is not as simple as he looks, and does not pay a tax if he can help it. In 1899, a Manipuri enumerator who was checking the houses in a Tankul village, found that no less than 30 belonged to widows, who, according to the rules in force, are exempted from assessment. This number seemed so disproportionately large that he determined to pursue his investigations further. At the dead of night he returned with the village elders and found seventeen of these so-called widows quietly sleeping with their husbands, who were forthwith assessed to revenue.

After the land and house-tax the principal sources

of revenue to the State are forests, fisheries, foreigner's tax, salt, and the amount which is annually paid by Government in compensation for the cession of the Kubo Valley to Burma. Details for each of these heads will be found in Table VII, and the abstract in the margin shows the receipts in 1908-04. The system under which the land revenue, house tax, salt tax, and forest revenue is raised has already been described.

Fish is an important article of diet in Manipur, and there are no less than 87 fisheries which are regularly put up to auction, in addition to minor streams, *bils*, and the Loktak lake in which anyone is allowed to fish free of charge. The following are the most valuable fisheries: The Waithou Shorien and the Waithou Phoomnow are two *bils* about eleven miles from Imphal, on the road to Thobal, which in 1908-04 fetched Rs. 6,450 and Rs. 1,475 respectively. The Ekope *bil*, south of Thobal sold, in that year, for Rs. 8,170; the Kajipat *bil*, a little to the south of the town, for Rs. 1,410; and the Poomlen *bil*, near the Loktak, for Rs. 1,000. The only other fishery which in that year fetched more than Rs. 1,000 was the Yangoi river, near the Loktak, which was knocked down for Rs. 1,850. The auction purchasers generally admit all the persons likely to frequent the fishery into partnership, and share with them the profit or the loss, if by any chance loss accrues; but in the case of rivers a cess is occasionally levied on each net employed. The *bils* are filled with water in the rains when the rivers are in flood, and generally dry up in the cold season. Most of the fish are caught by the simple expedient of setting wicker-work traps at the

places where the water drains back into the rivers. All the water that enters the extensive Waithou *bil* drains back through a narrow gorge between two hills not more than ten or fifteen yards in width. During the fishing season as many as two hundred women will be seen sitting here every morning, waiting to buy the catch of the previous night. A succession of high floods followed by a rapid fall of the water is the condition of affairs most favourable to the fishing industry. The net that is most generally in use is a square-shaped piece of netting with a pocket in the centre; the opposite corners of which are fixed to the four ends of two flexible bamboos crossed above it in the shape of an X. A stout bamboo is attached to it as a handle, and the net, in fact, differs in no way from the *parangi* of Assam. The ordinary cast net of Assam or *kewali* is also used by the men. Strange to say, the Manipuris in spite of their religious bigotry have not the smallest scruple with regard to the sale of fish. Even Brahman women will act as fishwives, though amongst most Hindus the sale of fish is restricted to the very lowest castes. Anything that cannot be sold or eaten fresh is dried in the sun, or, in the case of large fish taken in the hill streams, over a big fire. The best eating fish are *sareng*, *ngara*, *kharoubi*, *pemba*, *nga khra*, and *ngatel*; but none of them appeal strongly to the European palate.

Other
sources of
revenue.

The foreigner's tax is a tax of Rs. 5 on every adult foreigner settled in the State. Income Tax is only assessed on the salaries paid to Government servants, and does not go to swell the resources of Manipur. Court fees are not charged in cases in which Manipuris are

concerned. There are, at present, no receipts from excise, as the Manipuri does not take either liquor or intoxicating drugs, and no attempt is made to tax the liquor of the hill man. The poppy used formerly to be cultivated by the Muhammadans. It was found that opium was being smuggled into British territory, and orders have recently (1905) been issued to prohibit poppy cultivation. Rice beer is brewed by mixing a yeast made of powdered rice and the roots of a creeper with boiled rice, and leaving it to ferment. Spirit is also distilled from this liquor by primitive native methods.

During the minority of the Raja, the administration Government of Manipur has been vested in the Superintendent of the State. Separate offices are maintained in separate buildings for the Superintendent of the State and Political Agent, though the two functions are united in the single individual. This is necessary, as when the Raja is entrusted with the administration of the country, the State office will be made over to him.

The Political Agent is assisted by a member of the Assam Commission. The land revenue administration is supervised by a Sub-Deputy Collector lent by the Assam Government, and public works are in charge of a State engineer.

For the purposes of the administration of justice the valley is divided into eleven circles, in each of which there is a panchayat court. These courts have power to try civil suits in which the subject-matter in dispute does not exceed Rs. 50; and criminal offences of a minor degree, i.e., simple hurt, assault, trespass, adultery, which, as has already been explained, is not considered a

Criminal and
Civil Justice.

serious offence by the Manipuris; and theft and mischief where the property stolen or injured is not valued at more than Rs. 50. The only penalty which the panchayat courts can inflict is fine, and that must not exceed Rs. 50 in rural areas. The town panchayat at Imphal can impose fines up to Rs. 100 and can decide civil and criminal cases of an equal value. Rural panchayats have been opened at Sengmai, Maklong, Foiching, Kameng, Moirang, Wangoi, Kokching, Chairel, Ningel, and Bamonkombu; but they are said to be of little use, and they only decide a few disputes of a petty character. A special panchayat court also sits at Lilang for the trial of cases between Muhammadan Manipuris. Members of the rural panchayats are remunerated by the allowance of one *pari** of rice land free of revenue while in office, but members of the town panchayat receive no less than twenty-five *paris*. Above the panchayats comes the Chirap, a court composed of five magistrates which sits in Imphal. They can try civil suits up to any value, and all criminal cases except murder and offences against the State, but they cannot award more than two years' rigorous imprisonment, a fine of Rs. 500, or a flogging. Appeals from the town panchayat lie to the Chirap, each member of which is remunerated while in office by the grant of fifty *paris* of land free of revenue.

All cases to which a European British subject is a party are tried by the Political Agent or his Assistant; and the same officer, in his capacity of Superintendent

* A *pari* = 2½ acres.

of the State, decides all disputes in which a hillman is concerned. Appeals from the orders of the Assistant or of the Chirap Court lie to the Political Agent. This officer can pass sentence of death or of transportation for life ; but the confirmation of the Chief Commissioner is required whenever the death penalty is imposed or imprisonment for more than seven years. Manipuri custom is to a great extent followed in the courts, and the penalties prescribed differ to some extent from those laid down in the Penal Code. Adultery, for instance, is only punishable with fine, and petty theft with fine or flogging.*

The present courts are said to be too cumbersome for the prompt despatch of business, and the question of replacing them by Manipuri magistrates and munsifs has been already mooted. Most of the criminal cases consist of petty thefts of property and cattle, and house-breaking. Table VI shows the quantity of criminal and civil work disposed of.

Under native rule the punishments inflicted were ^{Punish-ments.} not unfrequently excessively severe. The murderer used originally to be executed in the way in which he killed his victim ; but Colonel Johnstone, when he was Political Agent, succeeded in inducing the Raja to order all persons sentenced to death to be beheaded. The victim was thrown on his back upon the ground, the back of his neck was placed on the trunk of a plantain tree,

* For further details with regard to the rules for the administration of justice in the Manipur State, see Manual of Executive Rules and Orders, pp. 75-81.

and the head hacked off. Flogging took place in the afternoon bazar, and sometimes as many as 500 lashes were administered; a whipping which occasionally proved fatal to the unfortunate recipient. Women were never imprisoned, and, at the present day, sentences of imprisonment are very seldom passed on women, so strong is the prejudice of the Manipuris on the subject. The form of punishment inflicted was, however, much more opposed to the ideas of decency prevailing in the West. The guilty woman was stripped naked save for a tiny apron of cloth. Her breasts were painted red, and a sweeper's brush fastened between her thighs. A rope was then put round her waist, and she was led in this disgraceful plight through the crowded afternoon bazar. Over her naked buttocks was suspended a small drum, and a second man followed behind beating the drum and proclaiming her offence. Women who had passed through this ordeal generally allowed an interval of several months to elapse before they again appeared in the bazar, and it thus had the affect of confining them for a time to their own houses.

Police and
Jails.

There is a regular system of rural police in the valley; a chaukidar, who is elected by the people subject to the approval of the Political Agent, being appointed to every hundred houses. There is, however, only one civil police station in the State, which is situated at Imphal, and the whole civil police force consists of 19 men under a Sub-Inspector. A battalion of military police is kept up by the State, which has a sanctioned strength of 13 commissioned officers and 364 non-commissioned officers and men. The men wear a neat

uniform of dark green cloth, and are armed with muzzle-loading tower muskets of 1856 and bayonets. The military police hold eight outposts on the three main roads, distributed as follows:—

Cachar Road.		Kohima Road.		Tammu Road.	
Outpost.	Men.	Outpost.	Men.	Outpost.	Men.
Kaopum ...	10	Sengmai ...	4	Sibong ...	9
Barak ...	4	Kairong ...	10	Moreh ...	3
Makru ...	4	Mao ...	8		

The chaukidars are useful as a reporting agency, and sometimes bring to light ingenious frauds which have been perpetrated by Manipuri swindlers. On one occasion, an escaped convict collected Rs. 600 amongst the Nagas to pay for the Political Agent's passage home. The trick was exposed by a Naga, who met the Political Agent and expressed some surprise that he should still be there, as several months before he had paid Rs. 5 towards the cost of his steamer ticket. On another occasion, a bill from a Calcutta tradesman, headed with the various coats of arms that sometimes adorn these documents, was used as a Government parwana, authorising the levy of a cess of Rs. 2 per house to be paid to the bearer of this imposing piece of paper. Another case occurred in 1904, when some convicts, marching with a warder through the valley, collected Rs. 400, on the pretence that it was to be used for the reconstruction of the house of the Assistant Political Officer, which had been burned to the ground a short time before.

The Jail is surrounded by a fine brick wall and has accommodation for 100 prisoners. The walls of the

wards are made of whole bamboos. The prisoners are usually employed on extramural labour.

Education.

Education, it need hardly be said, received little encouragement in the days of native rule. In 1869, Brown reported that there were no schools or any wish for them on the part of the authorities. Offers of assistance in the formation of a school were declined by the Manipuris, who stated that they preferred to remain ignorant. Some of the highest officials did not know how to read or write, and, like the knights of the middle ages, despised such arts as beneath their serious consideration. In 1872, a vernacular school was opened at Imphal, but the attendance was extremely small, and very little was done by the Raja or his officers to stimulate the cause of education. The Johnstone Middle English School was, however, opened in 1885, and, though it was closed for a time during the disturbances of 1891, it was reopened on June 1st, 1892. In the following year two pathshalas were opened; and in 1903-1904, there were in the State one Middle English, and one Upper Primary school and 28 pathshalas. Text-books have been prepared in Manipuri, and instruction is now given in that language. The year marked a great advance in the spread of education, and the Manipuris are evidently becoming sensible of its advantages. The number of pathshalas was increased from sixteen to twenty-eight, and the daily average attendance rose from 897 to 1,257. Female education has as yet made little progress. A girls' school was opened, but was closed again in 1902 from motives of economy. There are no difficulties in the shape of caste scruples or the

restrictions of the purdah to be overcome, but the shrewd Manipuri woman would have to be convinced of the practical value of education before she would send her child to school. In 1901, only 9 per mille of the population knew how to read and write, and the number of literate women was less than one per mille. It must not be supposed from this that the Manipuris are rude uncultured boors. Cut off as they are by their mountain walls from their fellow-men, it is not to be expected that they would take much interest in the affairs of the outer world, and a literary education has few charms for them. But they are well dressed, well housed, and clever craftsmen. Men and women alike are full of enterprise and intelligence, and few people manage better without schooling than the Manipuri.

Manipur is by no means an unhealthy place. In spite of the presence of myriads of mosquitoes, malarial fever is not so prevalent as it is in the neighbouring Province of Assam. The Manipuri is a larger and stronger man than the Assamese; he is generally well developed, and without being lean he seldom runs to fat. He does not age so rapidly as the plainsman of Assam, and once that the perils of infancy have been passed, the mean duration of life is probably considerable. But, if he is fairly free from fever and the general debility with which it is so frequently accompanied, he often pays a heavy toll to cholera. Drinking-water is usually taken from the small pond in the cottage garden into which all the drainage of the compound is deliberately carried. As though this were not enough, the people wash their clothes, their cooking utensils, and their persons in these

Medical Aspects. Manipur healthy, but liable to epidemics of cholera.

filthy pools, and then draw their drinking-water from them. If the rain holds off too long in the spring, these ponds dry up, and the people have recourse to the rivers, which have by this time sunk to little more than ditches creeping between high banks covered with every kind of filth. The first flood brings down this accumulation of impurities, and if they contain the germs of cholera, they are disseminated with surprising rapidity throughout the valley. The infection is still further spread by the custom which dictates that the dead should be burned on the river's bank, and that the corpse of a Brahman, even if he has died of cholera, should be bathed in the river itself. Cholera is first mentioned in the Manipur State chronicles in 1830, when it is said to have been the cause of heavy mortality. In 1850, there was another serious epidemic, and the Maharaja, Nur Singh, was numbered amongst the victims. Outbreaks of cholera are also reported in 1856, 1858, 1872, 1886, 1891, and 1896. In 1898, the disease appeared in the valley in the most virulent form during the months of May and June, and raged in the hills in July and August. The season was a very dry one, there was little drinking-water to be obtained except from the muddy streams flowing along the river beds, and this source of supply was soon contaminated. Many casualties went no doubt unrecorded, but the reported deaths from cholera in the valley were no less than 6,053, or 82 per mille of the population as recorded in 1901; a terrible death-rate assuredly to be caused by one disease, and that too in the short space of two months.

Small-pox.

Small-pox used at one time to be very common, but

the people are fully alive to the advantages of vaccination; and in the five years ending with 1902-03, 60 per mille of the population were successfully vaccinated each year, a proportion which was nearly 50 per cent. higher than that recorded for the Province as a whole. In 1891, when small-pox was raging with great virulence in the valley, the British garrison enjoyed almost complete immunity, and the people were not slow to act upon this admirable object-lesson. At the present day the Nagas soon complain if the vaccinator does not visit their villages with a certain regularity. The Kukis, however, regard the subject from a different point of view. Like Malthus they are afraid that the food supply may not suffice for the ever-increasing number of consumers. It is hard enough, they say, to live as it is, so why keep people alive whom God would kill. In the chapter on the history of the State, it has been shown that the Kukis are always willing enough to assist the Deity in his efforts to keep down the population.

Influenza occasionally causes serious mortality, especially in the hills, and the people suffer a good deal from dysentery. Conjunctivitis and itch are very common, and venereal disease is said to be fairly prevalent, though the troops in garrison have been fairly free of recent years. Measles sometimes causes serious infant mortality. No accurate information is, however, available with regard to the medical aspects of the State. Vital statistics are not recorded, and there are very few data from which conclusions can be drawn. This, at any rate, seems fairly clear, that man, like most other living things, enjoys better health and attains a higher degree

Other diseases.

of physical development than he does in the valleys of the Surma or the Brahmaputra. There is only one hospital in the State. It contains beds for 12 male and 2 female patients, and in 1908, had a daily average of nearly 9 inmates. The Manipuris themselves do not, however, seem to place much faith in European medicine, as the daily average of out-door patients was only 29—a figure which is very small for such a large and populous community as Imphal. To surgery they object on the ground that it is painful, but will consent to be operated on for stone when the disease has actually become worse than the prospective remedy.

PREFACE.

The tenth volume of the Assam District Gazetteer series contains the account of the Khasi and Jaintia, the Garo and the Lushai Hills. These accounts are necessarily brief, for little has been said of the interesting tribes by whom these districts are inhabited, as elaborate monographs on these tribes are now under preparation by officers who are intimately acquainted with their habits. The districts are sparsely peopled, apart from Shillong there are no towns, the system of administration is simple, and there is little of industry or commerce. There is thus but little for a Gazetteer to add to the tribal monograph. I am indebted to the various District Officers for their kindness in examining the proofs, and to Major Shakespear for his courtesy in criticising the account of the Lushai Hills, a district with which he was for so many years so intimately connected. It should be added that these Gazetteers were written before the partition of Bengal, and that wherever the word "Province" occurs it is to the old Province of Assam that reference is made.

SHILLONG :	}	B. C. ALLEN.
<i>October</i> 1905.		

PART I.
KHASI AND JAINTIA HILLS DISTRICT.

CONTENTS.

CHAPTER I.—PHYSICAL ASPECTS.

	PAGE.
Area and boundaries—General appearance and mountain system—River system—Places of interest—Geology—Economic geology—Lime—Marble—Petroleum—Coal—Iron—Gold—Climate and rainfall.—Storms—Earthquakes—Fauna—Flora	1 to 40

CHAPTER II.—HISTORY.

Khasi raids on Sylhet—Mr. Scott's march across the Jaintia Hills—Construction of road through Khasi Hills and massacre of Nongkhlaio—Punitive measures—Submission of all the chiefs by 1833—The Khasi seimships—System of inheritance—The Jaintia Hills—Risings in 1860 and 1862—Subsequent history—Archæology	41—54
--	-------

CHAPTER III.—POPULATION.

Area and density—Towns and villages—Growth of population—Migration—Sex—Marriage—Infirmities—Language—Caste and tribe—The Garos—The Khasis and Syntengs—The Lalungs—The Mikirs—Religion—Animism—Christianity—Other religions—Occupations,	55—69
--	-------

CHAPTER IV.—AGRICULTURE AND FORESTS.

Crops raised—Rice—Millets—Maize and Job's tears—Potatoes—Oranges—Pan and black-pepper—Areca nut—Bay leaf—Cinnamon—Experimental farms—Agricultural implements—Live stock—Beekeeping—Forests	70—84
--	-------

CHAPTER V.—MISCELLANEOUS.

Arts and industries—Lac—Food and dress—Rents and wages—Prices—Economic condition of the people—Communications—Navigable rivers—Post and telegraph—Trade—Shillong—Cherrapunji—Jowai ... 85—99

CHAPTER VI.—GENERAL ADMINISTRATION.

General administration—Land revenue—The Jaintia Hills—Country spirit—Opium—Ganja—Income tax—Public Works—Criminal justice—Registration—Civil police—Jail—Education—Medical 100—112

CHAPTER I.

PHYSICAL ASPECTS.

Area and boundaries—General appearance and mountain system—
River system—Places of interest—Geology—Economic geology
—Lime—Marble—Petroleum—Coal—Iron—Gold—Climate and
rainfall—Storms—Earthquakes—Fauna—Flora.

The district of the Khasi and Jaintia Hills is situated between $24^{\circ}58'$ and $26^{\circ}7'$ N. and $90^{\circ}45'$ and $92^{\circ}51'$ E. and covers an area of 6,027 square miles. On the north it is bounded by Kamrup and Nowgong, on the west by the Garo Hills, on the south by Sylhet and Cachar, and on the east by the North Cachar Hills and Nowgong.

The whole of the district is composed of hilly country. On the northern and western borders these hills take the form of tumbled ranges, which run for the most part north and south, and have a general height of between two and three thousand feet. For the first 27 miles after entering the district the road from Gauhati winds its way amongst these jungle covered hills. The valley bottoms near the road have been cleared and cultivated by settlers, but elsewhere there is nothing but forest to be seen. The great trees are linked together with the coils and loops of enormous creepers, and on slopes that have been cleared for cultivation and left to fallow there is a dense growth of bamboo jungle. From the top of some of the higher ridges a fine view can be obtained over range upon range of hills to the blue plains below, but there are no signs anywhere of the handiwork of man, for this steamy

and malarious tract is very sparsely peopled. Twenty miles from Shillong the road emerges from the forest, and from this point to the southern frontier of the district there are rolling grassy hills and breezy uplands which have nothing about them to suggest the East. Patches of forest are still to be seen in the valley bottoms, and here and there a pine may be descried, the advanced guard of the fragrant woods that surround Shillong. Viewed from above there is something very beautiful about this open country. There are no peaks, or rocks, or ridges, but soft rounded hills covered with fresh soft turf which from a distance take on a delicate blue green tint, and look as soft as velvet. At Barpani, the road starts on a climb of 1,800 feet to the Shillong plateau, mounting through pine woods from which peeps can now and again be had of the beautiful gorge of the Umiam. From Shillong, again, there is another rise of about 700 feet to the high plateau, which stretches from there to the latitude of Dumpep and then gradually declines in height to the edge of the hills at Cherrapunji. Here and there an isolated hill rises four or five hundred feet above the general level, but the country as a whole consists of rolling grassy downs, intersected with river valleys which in the southern portion of the district take the form of precipitous ravines. The general level of the high plateau in the centre of the district is not much below 6,000 feet, though it decreases in height towards the east and west, and the wind blows keenly over these open downs. Further south the traveller passes with strange

rapidity from the temperate to the tropical zone. The enormous rainfall of this region has hollowed out the river valleys into deep ravines, and the hot moist air at the bottom of these gullies stimulates the growth of the most luxuriant vegetation. The road passes along near the summit of the cliffs, but from far below mounts up the roar of the river hurrying to the plains, and as the clouds of mist roll aside, a glimpse is obtained of the rich rank growth of a tropical forest. The bulk of the Khasi tribe live on the high plateaus. The northern half of the district, which consists, first of open rolling hills and further north of hills covered with jungle, is known as the Bhoi country, and the inhabitants as Bhois. These Bhois are for the most part Mikirs and Lalungs, with a sprinkling of Khasis and Kacharis, but Khasis do not thrive on these lower hills and do not care to settle in this malarious country. Between Khyrim and the Bhoi country live a small tribe called the Nongtungs (the stinkers) who seem to be a cross between the Syntengs and the Mikirs. The valleys on the southern face of the hills are known as the War country.

None of the hills in the central and southern portion of the district have anything of the rocky or precipitous about them. Their sides are covered with short grass, and from one direction or another they can generally be ascended by a man on horseback. On the summits of the higher hills there is often a fine grove of oaks, rhododendrons, and other trees hoary with lichen and antiquity. These groves possess a sacred character, and it is this

Principal
hills.

which has preserved them from the woodman's axe. The following is a list of the principal hills with their height:—

- (1) Rableng—height, 5,671 feet. (2) Sohpetbyneng—height, about 4,000 feet. (3) Sywer—height, 6,050 feet. (4) Shillong—height, 6,450 feet. (5) Dingiei—height, 6,077 feet. (6) Kyllang—height, 5,684 feet. (7) Laitblih—height, 5,800 feet. (8) Laitdera—height, 6,000 feet. (9) Thanjinath—height, 4,448 feet. (10) Nongjriong—height, 4,995 feet. (11) U-Mun—height, 6,221 feet. (12) Maoflang—height, 5,931 feet. (13) Maokaling—height, 5,900 feet. (14) Marpna—height, 5,600 feet. (15) Symper—height, 5,700 feet. (16) Maosngi—height, 5,810 feet. (17) Laitmarkhan—height, 5,313 feet. (18) Nongsynrih—height, 5,585 feet. (19) Maskuin—height, 5,306 feet. (20) Nongkrong—height, 5,606 feet. (21) Kyllai—Lyngsngun—height, 5,128 feet. (22) Maolihbah—height, 4,252 feet. (23) Patermylong—height, 5,755 feet.

**Rivers
draining into
the Surma
Valley.**

The high plateau that traverses the centre of the district is the watershed of the hills. The following are the principal rivers that flow towards the south into the Surma Valley. On the west there is the Jadukata, or Kynchiang, which rises on the southern slopes of the hills between Mawthadraishan and Mairang. It flows a tortuous westerly course, then makes a sharp bend towards the east, and debouches through a deep ravine on to the plains of Sunamganj. Its principal tributary is the Ka Blei which joins it from the west. Further east comes the Um Maopa, which rises to the west of the

Maoflang plateau, and falls into the Surma, a little to the west of Sunamganj. The Bogapani rises on the southern slopes of the Shillong peak, and flows westward and southward to the plains of Sylhet. The road from Shillong to Dumpep crosses it on a fine iron bridge, and the bridle path from Maoflang to Cherrapunji by a suspension bridge, situated at the bottom of a gorge of singular beauty. Near the plains the river passes the important village of Shella, and falls into the Surma a little to the west of Chhatak. The Mangot or Maheshkhali also rises near the sources of the Bogapani, but it flows eastwards and then southwards, and for a considerable distance forms the boundary between the Khasi and the Jaintia Hills. In the plains of Sylhet it is known as the Peine Gong. The Hari of Sylhet rises near Jowai and is known in the hills as the Myntdu. Other rivers that make their way towards the south are the Puang, and the Kaw Um or Lubha.

On the north the principal rivers are the Ka-Khri, which rises a little to the east of Mairang, and is known as the Kulsi in Kamrup. The Digru rises near Sohpetbyneng, flows westward crossing the Gauhati road, and then turns north. Near the boundary of the district it again turns east, crosses the Gauhati road at Barnihat, and finally falls into the Kalang near its confluence with the Brahmaputra. The Umiam rises a little to the north of Maoflang, and flows in a deep gorge between the Dingiei range and the plateau of Shillong. At Barpani it is crossed by the Gauhati road, and from that point takes a generally easterly course, till it finally

Rivers
draining
into the
Brahma-
putra.

falls into the Kapili. In the plains it is known as the Kiling. Further west comes the Umkhen which is known as the Barpani in Nowgong. The greater part of the boundary between the North Cachar and Jaintia Hills is defined by the Kapili, which pours its waters into the Kalang and so into the Brahmaputra. Its principal tributaries from the west are the Um Myntang and the Mauriang. The extent to which the waterways of the district are used as routes for traffic is discussed in the section on communications. These rivers possess the characteristics usually associated with hill streams. The bed is rocky and gravelly, the current swift, and after heavy rain even small streams come down in spate. In places the water comes foaming and roaring over huge blocks of granite—in places the river stretches out in still clear pools of blue green water. There are several magnificent cascades in the neighbourhood of Shillong, and at Maosmai, near Cherrapunji, some of the minor streams fall over a sheer precipice many hundred feet in depth into the gorge below.

**Places of
interest in
the district.**

There are several places of interest in the district which are fairly accessible from the station of Shillong. On the further side of the Umiang stands the Dingiei hill. Khasi legend has it that a tree once grew on the summit of this hill which over shadowed the whole world. The Khasis tried to fell the tree in order to let in the sun, but during the night the wood always grew again in the place where it had been cut away by day. After a time the people dis-

covered that every night a tiger came and licked the wounded part, and that this caused the wood to grow again with marvellous rapidity. The Khasis accordingly tied their daos edge outwards round the place, the tiger cut its tongue and forsook the tree, and the work was successfully completed. Heaven and earth were in those days very close together, and heaven was joined by an umbilical cord to the navel of the earth at Sohpetbyneng. When the tree was felled the cord was broken and the two worlds drifted apart from one another. There are two routes from Shillong to the summit of Dingiei. One is a foot path which drops straight to the gorge of the Umiam. For a height of about 1,000 feet on either side of the river the gradient is extremely steep, almost precipitous, and this portion of the path would be quite impracticable for a beast of burthen. By the other route the traveller can drive to Barpani by the Gauhati road, and from there the ascent is much more gradual and can be negotiated by a pony. On a clear day a magnificent view is obtained during almost the whole of the ascent from Barpani, over the rolling Bhoi country which lies some 3,000 feet below the summit of Dingiei. Dumpep, which is close to the high peak of Sywer, from which a magnificent view can be obtained on a clear day over the southern hills and the plains of Sylhet, is also easy of access. So is Maoflang, and from Maoflang there is a charming walk to the gorge of the Bogapani over 1,000 feet below. The river lies in a series of blue green pools connected with short rapids at the bottom of a ravine which recalls the passes on the Italian side of the Alps.

**The Kyllang
rock.**

From Maoflang it is a pleasant trip to the Kyllang rock. There is a bridle path to Mairang 15 miles away, where there is an inspection bungalow. From there it is about seven miles to the hill itself. The Kyllang rock rises out of rolling grassy downs, a sheer cliff of granite upwards of 700 feet in height. On the east and north-east the rock has been to some extent disintegrated, trees have obtained a foothold in the crevices, and the ascent is fairly easy. On the west and south-west it is a sheer dome, with an absolutely smooth and unbroken surface. The effect of this mighty precipice suddenly rising from soft, undulating grass land is singular to a degree, and the spectator cannot but wonder how this huge mass of rock ever found its way into such incongruous surroundings. The explanation offered is that the Kyllang is a gigantic specimen of a phenomenon which, on a very much smaller scale, is extremely common in the hills. Scattered about the whole granitic area are huge boulders of rock imbedded in, and of a similar character to the general mass, though much more highly indurated. The Kyllang rock is simply one of these boulders, but a boulder framed on a titanic scale.* According to Khasi legend the Kyllang rock was originally a man. He is married to Thadlasken, a small pool near Jowai, and when he goes to visit his wife violent storms blow across the hills. The Kyllang rock is also said to have fought with another conical hill in the neighbourhood called Symper and to have been defeated.

* *Vide* Memoirs of the Geological Survey of India, Vol. I, Part III. 55.

Jowai itself is well worth a visit, as the path there runs through charming scenery where grassy meadows and woods of oak recall the parks of England. At Wahjajer, a little to the west of Jowai, a path turns off to Nartiang, where there are remains of the Hinduism of the Jaintia Rajas, while the Khasi religion is represented by some of the largest monoliths in the hills. At Nongkhlih, near the borders of the North Cachar Hills, there are a great number of natural limestone monoliths, which viewed from the hill above look like the ruins of some regimental lines. From Bataw, 28 miles south-east of Jowai there is a magnificent view on one side, over the plains of Sylhet, on the other, across the hills and the gorge of the Myntdu. On the summit of the hill there is a large pond which is almost worthy of the name of lake, and the dense orange groves in the vicinity add much to the charms of a scene already beautiful.

**Places of
interest in
the Jaintia
Hills.**

Nongkhlah has historical associations of interest, and at this point the old Gauhati road crosses the beautiful gorge of the Khri river. There are hot springs on the right bank of the Kapili beyond Jowai. One of the springs is a pool of hot water about six feet square, the other is a sulphur spring which flows into the Kapili. There are springs also near Jakrem in the Maharam State about 14 miles as the crow flies beyond Maoflang. There are interesting caves at Cherrapunji, and also at Rupnath which is about two miles from the inspection bungalow at Syndai, 22 miles from Jowai on the Jowai-Jaintiapur path. Another cave at Lakadong was thus described by Mr. Ringwood in 1876."

**Hot springs
and caves.**

"A hole in the rock leads into a large cavern about 70 feet long, 30 feet broad and 30 feet high. At the further end is another arched opening, which is the entrance to another magnificent hall of beautiful proportions, and almost as regularly formed as if cut out of the rock. This hall is exactly fifty-six feet wide, about eighty feet long, and sixty feet high. It is oval in shape, and the entrance and exit are arched, and much lower than the roof, as well as being narrower than the width of the hall.

The roof is perfectly flat and oval, the sides are perpendicular and even. Passing through this hall, you come to a long passage about forty feet wide and thirty high, which after about 200 feet suddenly slopes down into the ground at an angle of about thirty degrees. The natives would go no further. Steam issues from the passage here, and the heat of the air is very great. Like all the other crooms, this very beautiful cave has evidently been formed by the falling in of the rocks over the limestone."*

These caves have not been visited by a European since the earthquake of 1897, and it is possible that their condition may have been much changed.

Waterfalls

A little to the south of Cherrapunji are the falls of Maosmai, where some of the streams from the plateau are precipitated over a sheer cliff several hundred feet in depth. Even finer falls are to be seen at Dainthlen and Noh-ka-Likai about two miles to the west of Cherrapunji. The name of the latter fall commemorates a woman, Ka Likai, who is said to have thrown herself over the cliff. Her husband was jealous of her love for her child by another man, and killed the poor little thing and served it up as a curry. The wretched mother, in her ignorance, ate freely of this horrid food, and on learning the truth committed suicide. There are also very fine cascades in the immediate neighbourhood of Shillong.

* *Vide Assam Gazette of January, 29th, 1876.*

The geology of a hill tract is too technical a subject to admit of adequate discussion in a Gazetteer, and those interested in the matter would do well to refer direct to the authorities.* The basis of the Assam Range, of which the Khasi and Jaintia Hills form the central section, is a gneissic rock. At its western end sandstones and conglomerates, which are referable to the cretaceous system, are superimposed upon the gneiss, and are themselves overlaid by limestone and sandstone of the nummulitic age. Further eastward, what is known as the Shillong plateau, rises steeply from the Surma Valley, but on its northern face falls away in a series of low hills towards the Brahmaputra. The gneiss is succeeded by the Shillong or transition series, which consist of quartzites, conglomerates, phyllites, and schists, through which appear granite and dioritic rocks. Upon this series have been superimposed sandstones and conglomerates of the cretaceous age, which contain occasional coal seams. These, in their turn, were overlaid by beds of the nummulitic or lower tertiary period, consisting of limestone and sandstone with interstratified shales and coal deposits. Along the southern edge of the plateau, in the neighbourhood of Cherrapunji, a group of bedded basaltic rock, known as the Sylhet trap, has been forced up between the cretaceous and the older formations.

Mr. Oldham's
description
of the hills.

Mr. Thomas Oldham has left on record the following conclusions with regard to the geology of the Khasi and Jaintia Hills.*

"I shall here briefly enunciate a few of the principal conclusions resulting from a general view of the previous descriptions of the geological structure of these hills. These are: that the general basis of the range is granite; resting upon it is a series of metamorphic rocks, gneiss, micaceous slates, quartz rocks, &c., which have been greatly altered, disturbed, and contorted by the granite which now supports them; that in connection with these changes there appears to be evidence to show that the line of greatest elevation caused by this granite, or rather by the forces to which this granite is the index, had a direction east and west. Subsequently to these disturbances and alterations of the older slates, these rocks have been subjected to long-continued and great wear and denudation; and upon their degraded surface was deposited a series of beds of sandy and earthy character, of varying composition, but in the aggregate, of considerable thickness, which have subsequently been subjected to great alteration. Another interval of considerable duration must now have occurred, during which disturbing forces were again exerted; for, upon the upturned and degraded edge of these schistose and quartzose beds, others have been formed of very different character, the prevailing composition of which is sandy, and which, as a mass, give abundant evidence of being shallower water deposits than the lower beds.

Again disturbances have taken place, contortions of these beds have been forcibly produced by the exertion of great forces of intrusion and pressure; and these forces appear to have been accompanied, if not produced, by the exhibition, on a considerable scale, and over a considerable area, of volcanic-like masses, which have been emitted in a highly heated condition, and have consequently exerted those modifying effects which might be expected to result from such an exhibition of heated masses on the large scale.

Above and upon these again, another series of beds of varying character, sandstones, limestones, and coal, of considerable aggregate thickness, was formed. Throughout the whole of this series, from

* Memoirs of the Geological Survey of India, Vol. I, Part II, p. 168.

top to bottom, in the conglomerates found at its base, in the clean sandstones higher in the series, in the fossils found in these beds, in the irregularity of their development and the constantly repeated occurrence of current marking and "false bedding," there is sufficient evidence to prove that the entire group, not less than two thousand feet in thickness, has been deposited and formed in water of no great depth. The same evidence is extended by the organic contents of the limestones. To admit of this occurring, there must have been a gradual and continuous depression of the surface within this area, maintained during the deposition of the whole of the series. These sandstones have subsequently been invaded by igneous rocks which have been forcibly intruded among them, and have produced considerable alteration in their texture and structure. There is no evidence to show the exact period at which such intrusion took place; but it must have been subsequently to the formation of all the sandstones.

The whole succession of groups has been subsequently elevated until it attained its present position. There is no sufficient evidence to show whether this elevation, or rather, the commencement of this elevation, was synchronous with or not, or was caused by or accompanied by, the intrusion of the trappean rocks.

The elevation of the rocks to their present position must, however, have been gradual and long-continued, to admit of the remarkable conditions under which we find them as shown by the many detached and small outlying portions at considerable distances from the main mass.

Coincidentally with and subsequent to this elevation of the hills, *en masse*, the ordinary atmospheric causes of degradation, which, owing to the peculiar climatic conditions of the district, are here exerted with great force, have been in operation to produce and modify the present aspect of the surface. And, further, the action of these forces appears to have been determined, as to the *direction* of its maximum effect, by a series of lines of jointing and fracture, and occasionally of dislocation or faulting, resulting from the earlier intrusion of the volcanic rocks.

The very gradual and continuous slope of the plains at the foot of the hills, will show that long subsequently to the period of their elevation, a sea had washed their base, and formed the widely-extended flats, from which their steep escarpments rise."

**Economic
geology.
Lime-trade
in 18th cen-
tury.**

The geological products of economic value are lime, coal, iron, and petroleum, by far the most important of which are lime and coal. From the earliest days of British rule the lime quarries of the Khasi Hills formed one of the principal attractions of Sylhet. The lime trade drew a large number of Europeans to that district, and it is to the indiscretions of these persons that some of the earlier Khasi forays were attributed. Mr. Robert Lindsay, Collector of Sylhet in 1778, was largely interested in the business, and describes the sources of his wealth in most poetic terms. "The chunam or lime rock is washed by the rapid stream. A magnificent cataract was seen rolling over the adjoining precipice, the scenery altogether was truly sublime. The mountain was composed of the purest alabaster lime, and appeared in quantity equal to the supply of the whole world." Of the trade of the Sylhet district he observed that "the only great staple and steady article of commerce is chunam or lime. In no part of Bengal, or even Hindustan, is the rock found so perfectly pure, or so free of alloy, as in this Province; therefore Calcutta is chiefly supplied from hence. This branch immediately attracted my attention, and I was led to investigate how far the trade could be improved or extended. I found it had hitherto been occupied by Armenians, Greeks, and low Europeans, but to a trifling extent only; while I had so greatly the advantage over them, from the command of the currency, that it was evident the trade might soon centre with me, and it accordingly did so."

Mr. Lindsay's business experienced some vicissitudes owing to the violent conduct of the Khasi chiefs, but lime no doubt contributed largely to the fortune that he was able to accumulate in Sylhet.

At the end of the eighteenth century the lime trade of Sylhet seems to have passed into the hands of the Inglis family, who enjoyed a monopoly of it for many years. The founder of the firm was Mr. George Inglis who died at Chhatak in 1850 after a residence of 56 years in the district of Sylhet. A fine obelisk which stands on a low hill from which there is a magnificent view across the rivers and swamps of Sylhet to the Khasi Hills, marks the last resting place of one of the earliest of the British pioneers in the Surma Valley. He was succeeded by his son Mr. Harry Inglis who was buried at Cherrapunji. The family obtained possession of considerable zamindaris at the foot of the plains, and so strong was their influence that they succeeded in effectually excluding all outside opposition. The administration of the Khasi Hills in the early fifties, was not much hampered by the ordinary usages of law, and the complaints preferred against Mr. Inglis by his would-be rivals form somewhat curious reading*.

Litigation took place with regard to a lime quarry called Choon Chara, which was situated on the boundaries of Sylhet and the Khasi Hills and was claimed by the authorities of both districts as lying within their jurisdiction. Mr. Harry Inglis asserted a title to the quarry

which he professed to have derived from one Sona Khasi, while two other gentlemen, Messrs Duncan and Gibson, laid claim to the land on the ground that they had leased it from the ex-Raja of Jaintia and another person. In the course of this dispute various charges and counter-charges of assault were made, and the young Lieutenant, who was discharging the functions of a magistrate in the Cherra court, undoubtedly acted in a very singular and arbitrary manner. Sona Khasi complained that Messrs. Duncan and Gibson had cut down bamboos standing on his land. Choon Chara had at that time been found by the Collector of Sylhet to lie outside the Khasi Hills, and the dispute was evidently of a civil and not of a criminal nature. In spite of this, the magistrate at Cherra, without issuing a summons, issued a warrant for the arrest of a Mr. Cattell, who was supposed to be connected with the business, and sent a strong party of police to seize his person. A magistrate was then sent from Sylhet to enquire into the question of the disputed boundary, but it is said that Mr. Inglis' men assaulted Mr. Cattell, even in the presence of the magistrate, and upset his boat. The Commissioner of Dacca ultimately decided that Choon Chara was situated in the Khasi Hills, whereupon proceedings were revived against Mr. Inglis' European rivals in the lime trade. They fled the district, but their servants were punished with exemplary severity, and the magistrate even proceeded to attach large quantities of coal belonging to the Company on whose behalf they had been acting

Mr. Mills, an Officiating Judge of the High Court of Calcutta, who had been deputed to visit and report upon the district, recorded the following observations on these cases :

Mr. Mills's
account of
these
transac-
tions.

" Mr. Inglis has the absolute control of the trade in the Cherra and Jaintia Hills, and through his connection with Colonel Lister,* his long residence at Cherra, and the extent of his dealings, has acquired unbounded influence in the country, and I am constrained to add that the Cherra courts have lost the entire confidence of the people. The state of feeling amongst the natives is such that no one would dare to bring an action or give evidence against Mr. Inglis. Every person I have conversed with spoke in this strain, and the proceedings of the court certainly strengthen the impression."

These are the restrained and temperate comments of a Judicial Officer of high standing, but the condition of affairs is described in a much more graphic and sensational manner by a Mr. Sweetland, a gentleman, who seems in some way to have been connected with the business, and who addressed Mr. Mills in a lengthy communication from Calcutta. He describes how Mr. Cattell's house was surrounded by a party of armed police from Cherra, and how he fled by night to avoid being carried to Cherrapunji. "It is a fact," he goes on to say, "that Messrs. Gibson and Cattell were obliged to fly to avoid getting into the hands of the Cherra authorities. Mr. Duncan fled before. I know beyond dispute that they were ruined; they state they fled for their lives; Mr. Jones is said to have done the same and to have died afterwards of a broken heart." 'Fled for their

* Colonel Lister was Political Agent in the Khasi Hills and father-in-law of Mr. Inglis.

lives' is a strong expression to employ, but Messrs. Gibson and Cattell did not hesitate to declare that they were unable to contemplate even a temporary sojourn in the Cherra jail with equanimity. Four days, they said, would have been enough, in that time they would have been no more. The jail officials were all creatures of the man with whom they had been contending, and from the unscrupulous way in which they had been treated, they augured the worst. The picture as drawn by Mr. Sweetland is doubtless overcoloured, but it seems clear enough that in the early fifties Europeans were not wanted in the Khasi Hills, and that the local magnate had effective means for making his displeasure felt.

**Rise in price
of limestone.**

In 1858, Mr. Allen, a Commissioner of Revenue, complained of the excessive price of limestone due to the practical monopoly enjoyed by Mr. Inglis. The total output of stone was placed at 17 lakhs of maunds, 15 of which were quarried by Messrs. Inglis, and the remaining two by a Mr. Sarkies and a Mrs. Stark. Limestone was selling at Chhatak for Rs. 180 the thousand maunds, a price which was said to be 50 per cent in advance of that ruling a few years before. Mr. Allen was much impressed by the inconveniences resulting from the high price of lime, and made certain suggestions for the abolition of the monopoly.* Nothing, however, seems to have been done, and in 1877 the Chief Commissioner

* Report on the Administration of the Khasi and Jaintia Hills by Mr. W. J. Allen, 1858, page 47.

addressed the Government of India upon the subject. The quarry leases had been put up to open auction, but Inglis and Company had bought them in, in many cases at fancy prices, and only worked a few of them. The price of limestone at Chhatak had risen to Rs. 385 per thousand maunds, an enormous advance on the price of twenty years before, though the cost of laying it there was said to be not more than Rs. 90 per thousand maunds.

Government accordingly decided to reserve one quarry for departmental operations, from which the wants of Government in Bengal as well as in Assam could be supplied. Three years' leases of the remaining quarries were to be put up to auction, subject to the proviso that not more than three quarries could be held in the same interest and that quarries which were not worked could be resumed.* The experiment did not, however, prove a success and the new restrictions did not have the effect of putting an end to the monopoly, as Messrs. Inglis and Company arranged to purchase the whole of the output of the lessees. In January 1879, eighteen quarries were put up to auction. Only five of these were actually sold, for a total annual rent of Rs. 23,410 as compared with the Rs. 40,975 which they had fetched under the old *régime*. The remaining thirteen, which had formerly fetched a revenue of Rs. 26,538, were again put up to auction in the following October, but only attracted bids with an aggregate total of Rs. 529. In March 1880, they were again put up, when eight were

Attempts to
break
the mono-
poly.

* File No. 46 J of 1878.

sold for Rs. 630. The auction system was so little satisfactory, that the experiment was tried of calling for tenders for the quarries. This proved a complete failure, and the leases were again put up to auction, but only a few were sold and the prices obtained were very low.* Unsatisfactory though this fall of price was, alike to Government and the seims concerned, it was no matter of surprise. In order to maintain their monopoly Messrs. Inglis had purchased quarries, which, on account of their inaccessibility or the scarcity of labour it would hardly have paid to work. In several cases they had paid exorbitant prices for the leases, as their value had been forced up by persons who bid them up, in the hope that they might be bought off. On the abolition of the monopoly these leases became unsaleable and there was a serious fall in the revenue derived by Government from lime.

The permit system.

A system was then introduced under which the quarries were thrown open to the general public, and royalty levied at the rate of Rs. 20 per 1,000 maunds of stone exported. In Khasi territory half of the royalty realized was credited to the seim. Coincident with the throwing open of the lime quarries there was a rise in the price of lime, and capital and labour were alike attracted to the industry. The natural results soon followed. The supply exceeded the demand, and the trade began to languish. Government accordingly decided to regulate the supply, and in 1889 most of the

* Letter No. 729, dated 19th May 1882, from the Secretary to the Chief Commissioner to the Secretary to the Government of India in the Revenue Department.

smaller lime quarries were closed. The Langrin and Nongstoin quarries were still held on rent by Mr. Inglis, and the Sohbar, Barpunji (Nongjiri), and Shella quarries were worked under the permit system. The western portion of Sohbar was leased to a Khasi named U. Don. Roy, and the eastern portion to Messrs. Inglis and Company. In 1894, Barpunji was leased for twenty years to Babu Jiban Roy for Rs. 3,000 per annum, and no royalty is levied at the present day on the stone extracted from that quarry. In 1899, a monopoly of the Uthma quarry, subject to the payment of the usual rates of royalty, was given to a European gentleman, in the hope that he would invest capital in the industry, but he did not renew the lease, which was for a period of one year only. The revenue derived from lime during the ten years ending with 1901-02 averaged Rs. 15,700 annually which was about one thousand rupees less than the average for the preceding decade. The total output in 1904 was about 123,000 tons of limestone.

The lime quarries are situated all along the southern face of the hills from the Lubha river on the east to the Maheshkhali river on the west. The actual quarrying of the stone is a comparatively simple matter, the difficulty lies in its extraction. The rock is generally trollied down to the banks of the nearest river and conveyed in small flat bottomed canoes over the rapids to Chhatak. The cost of boating is at all times very heavy, and quarries which are situated too far from a navigable stream, or which are cut off by too violent

**Site of
quarries
and cost of
production.**

rapids from the placid waters of the rivers of Sylhet cannot be worked at a profit. The removal of the limestone can, moreover, only take place during the rains, as in the cold weather there is not sufficient water in the rivers.

The following figures give a fair idea of the cost of extracting one thousand maunds of limestone in 1904. Quarrying Rs. 30, dynamite Rs. 2, trollying Rs. 10, boating from Therria Ghat to Chhatak Rs. 50, royalty Rs. 20. Total cost of 1,000 maunds of limestone at Chhatak Rs. 112; price obtained Rs. 120 to Rs. 130. The quarry men are generally Khasis, three of whom can extract 2,000 maunds a month, so that they earn about Rs. 20 per mensem each. Burning costs from Rs. 120 to Rs. 150 per thousand maunds, and lime sells at Chhatak for from Rs. 290 to Rs. 400 per thousand maunds. Freight to Calcutta is from Rs. 200 to Rs. 230 per thousand maunds.

**System of
manufac-
ture.**

The lime is burnt all along the banks of the Surma river from Chhatak downwards. The kilns are semi-globular in shape, and generally hold from 500 to 700 maunds of stone. Reeds from the marshes in the neighbourhood are used as fuel, and the stone is burnt for about four days and nights. There is a considerable waste of heat, as the European system, under which the burnt lime is withdrawn from the bottom of the kiln and fresh stone fed in at the top, is not in vogue. Kilns of this nature would, however, necessitate the use of coal as fuel, and coal would at present cost more than the reed jungle.

The following is a list of the lime quarries situated in the district. In the case of the quarries owned by seims or sardars half of the royalty realized is credited to Government.

* Held on 20 years' lease which expires on November 30th, 1914, by estate of late Babu Jiban Roy, at a fixed rent of Rs. 3,000 per annum.

† Held on lease which expires on April 30th, 1907, by Babu Brajendra Kisore Ray, zamindar of Gauripur, Mymensingh, at fixed rent of Rs. 3,000 per annum.

‡ Worked on permit system.

§ The Komrah and Panitolah quarries in this group are worked on the permit system.

Dr. Oldham points out that much of the limestone **Marble** would produce most durable, and occasionally very handsomely veined, marble, which would be well suited for chimney pieces and other domestic purposes.

Petroleum has been found in the valley of the Khasi- **Petroleum** mara river, on the southern border of the district a little

to the west of Shella. A prospecting license, conveying rights over one square mile of land, was issued to a Syndicate represented by Mr. G. L. Garth in 1902.

Coal.

Coal is found both in the cretaceous and nummulitic formations. The largest deposits of nummulitic coal are found at Cherrapunji, Laitryngew, Maolong, Mustoh, Maosanram, Maodon, Thanjinath, Lakadong, and Narpo. Cretaceous coal is found at Maobehlarkhar (near Maoflang), Borsora (near Laur), Wapung, Leukensuiet, and in the Langrin field on the Jadukata river.

The Cherrapunji field.

The Cherrapunji coal fields have been twice described, by Dr. Oldham in Vol. I, part 2 of the Memoirs of the Geological Survey of India, p. 185, and by Mr. LaTouche, Vol. XXII, part 3 of the Records of the Geological Survey of India, p. 167. The following account of this field is condensed from these authorities. The coal occurs near the top of an isolated ridge between Cherrapunji and Maomluh. It was first worked in 1840 by Captain Lister, the Political Agent in the hills, who sent down about 8,500 tons to Calcutta. In 1844, Government transferred its right in the mines to Mr. Engledue, the Agent for the Peninsular and Oriental Company, but in the following year this gentleman made over his lease to Messrs. Gisborne and Company of Calcutta, who worked this mine for about two years. In 1851, they transferred their rights to Mr. Moran, but, as none of the lessees had worked the mines since 1846, they were resumed in 1859 on the recommendation of Mr. W. J. Allen. Since that time operations have

only been carried on in a desultory manner by Khasi miners. The principal obstacle to the exploitation of the seam lies in the fact that it is situated at a height of 4,000 feet above the level of the sea, and that there is no easy means of transport to the plains. Such coal as is extracted is still carried down the hill by coolies, and it is obvious that till a cheaper and more effective means of transport has been provided, the mines cannot be worked on any considerable scale. Mr. LaTouche calculated that the field contains about 1,200,000 tons of workable coal, though this is only a rough estimate, and the actual quantity may be either rather more or rather less. At present the field is worked by the Khasis in a wasteful and unsatisfactory manner, and Mr. LaTouche recommended that a practical miner should be engaged for a short time to teach the hillmen how to work in a systematic way.* A portion of the field lies in the territory of the seim of Cherra, a portion in the British villages of

* The following suggestions for working were made by Mr. LaTouche : -

A good plan of working the coal would, in my opinion, be to drive parallel galleries along the seam from side to side of the hill at a short distance from each other, which would ensure good ventilation, and then work out the coal in squares between these galleries, propping the roof where necessary, and when all had been removed, allow the roof over that area to fall in. There would be no extra expense in making these galleries over the present method of working, as they would be driven horizontally through the coal itself, and there would be little or no waste rock to be got rid of. The maximum length in any case need not exceed 600 yards, but at first they need not be made so long as this, as portions of the hill may be selected where the distance from side to side is not nearly so great. It is very important, however, that such work should be carried on under the supervision of a practical miner; otherwise great waste of coal is sure to occur, since, if the roof were allowed to fall in over any area before all the coal had been worked out, it would be most difficult and dangerous to reopen that part of the mine to get at the remainder. The system would be somewhat similar to that known as "Long wall" mining in England, but as the conditions under which the coal is found are very different from those of any coalfield in England, it would be necessary to find a man of education and intelligence sufficient to appreciate these changed conditions.

Maosmai and Maomluh. The subjects of the seim have hitherto been allowed to work the coal lying in his territory without restraint, an arrangement which is fatal to the proper exploitation of the measures. The British portion of the coalfield, in which no such right exists, has been properly surveyed and demarcated. The coal was analysed by Mr. Prinsep and gave the following results. Volatile matter, 37·1 per cent ; carbon, 62 per cent ; ash, 0·9 per cent. It is an excellent steam coal, and yields good gas and coke.

The Laitryngew field.

The Laitryngew, Maosanram, and Maobehlarkhar fields are described in the Records of the Geological Survey of India, Vol. XXIII, part 3, page 120. The first named field is situated near Serrarim, and is estimated by Mr. LaTouche to contain about 1,000,000 tons of marketable coal, though it is of inferior quality to the coal at Cherrapunji. The Maosanram field is about 14 miles south-east from Maoflang, on the road to Shella. It was estimated in 1890 to contain about 63,000 tons of coal. A small quantity of coal has been extracted to supply the wants of the lime burners in the vicinity. The Maobehlarkhar field is situated about five miles from Maoflang, near the eastern edge of the Bogapani gorge. The field is estimated to contain about 52,000 tons of excellent coal, and is the source from which Shillong obtains its fuel. The price at Shillong, only 19 miles from the pits' mouth, is very high (12 annas a maund or 27 shillings a ton), but the coal has to be carried across the deep ravine of the Bogapani before it can be put in carts. The Langrin coalfield is situated in the south-west corner of the district

west of the Ka Blei or Jadukata river. It is described by Mr. LaTouche in Volume XVII, part 3, of the Records of the Geological Survey of India, page 143. The seam extends over an area of some 30 square miles, and, lying as it does at the foot of the hills, is fairly accessible, but it is only about three feet thick. The coal, like that in the Maobehlarkhar field, is of cretaceous origin. The Maolong coalfield was taken on lease in 1901 by a Limited Company. It is estimated to contain about 15 million tons * of good workable coal, which, like the coal at Cherrapunji is of nummulitic origin.

The Lakadong field is situated a little to the north-east of Jaintiapur. It was described by Dr. Oldham in the paper which has been already quoted, by Mr. C. H. Ringwood, Assistant Engineer, whose report was printed in the Assam Gazette of January 29th, 1876, and by Mr. LaTouche in November 1889.† Most of the coal is situated on the two plateaus of Umlotodo and Umat. Mr. LaTouche estimated that there were about 850,000 tons in the former field, and about 310,000 tons in the latter. Mr. LaTouche was, however, very doubtful as to the thickness of the Umlotodo seam, and recommended that before any capital was sunk in machinery or in improving the means of communication with the plains, its thickness should be tested by a series of small pits or borings. The Umat coal lies near to the surface and could be very easily removed. The best method, according to Mr. LaTouche, would be to sink

The
Lakadong
field.

* This is not an official estimate.

† Assam Secretariat File No. 48 R of 1889.

shallow pits at short distances from each other, and, on reaching the coal, drive headings from one to the other along the seam. The coal included in the area between these headings might then be entirely worked out, and the roof allowed to fall in. Some propping of the roof would be required, but there is plenty of suitable timber in the neighbourhood. The field is situated at about 2,200 feet above the level of the sea, and a road would have to be made to the plains at Barghat seven miles away. From there the coal could be transported by water. There are several other fields in the vicinity, which were described by Mr. Ringwood, but in none of them are there any very considerable deposits.

Coal is also found at Jarain, a little to the south of Jowai, but communication with the plains is difficult. A seam has also been discovered near the Shillong-Gauhati Cart Road, about eight miles north of Shillong. The following is a list of the places in which coal has been discovered up to date :—

Iron.

Iron is found in the form of a fine sand, consisting of minute crystals of titaniferous magnetic oxide,

which are irregularly distributed in the mass of the softer portions of the granite rocks and also occasionally in some of the gneissose beds. The upper portion of the granite is partially decomposed, and, when it is desired to extract the ore, the iron bearing strata are raked into a stream of water which is carried along the foot of the scarp on which operations have been undertaken. The ore is gradually washed out of the sand and other matter, and is smelted in a primitive furnace. It is either sold in balls, or is worked up into daos, hoes, and other agricultural implements. The process is described in a note recorded in 1885, which was published in a book called Notes on some industries of Assam, at the Shillong Secretariat Press in 1896. A good account of the iron industry will also be found in Memoirs of the Geological Survey of India, Volume I, part 2. The largest deposits of iron were found near Myllem, Laitlyngkot, Nongkrem, and the granite district of that neighbourhood, and more to the west, near Langkoi. The industry was at one time of considerable importance, and the remains of old workings are to be seen on every side in the localities referred to, but at the present day it is in a very languishing condition. The principal places at which iron ore is smelted at the present day are—Nongspung west of Shillong, Umphrup near Nongkrem, and Nartiang in the Jowai subdivision.

Traces of gold were found by Mr. Oldham in connection with the iron ore, but in such minute quantities that they would not admit of profitable extraction.*

* Memoirs of the Geological Survey of India, Volume I, Part 2, p. 207.

**Climate and
rainfall.**

Table I shows the average rainfall recorded at four places in the district. The Khasi and Jaintia Hills enjoy the distinction of containing one of the wettest places on the surface of the earth. The average annual rainfall at Cherrapunji, a village on the southern face of the hills, is no less than 458 inches. Enormous though this rainfall is, it is little more than half of the maximum on record. In 1861, 905 inches fell, 366 of which were assigned to July alone. The maximum for a single day was, however, recorded in 1876, when 41 inches of rain fell in 24 hours. The hills at this point rise straight from the plain, and the south-west monsoon, blowing across the flooded tracts of Eastern Bengal and Sylhet, is suddenly stopped by this barrier of cliffs. The air, which is saturated with moisture, rises, cools, and is precipitated in the form of rain. The village is situated on a plateau overlooking the plains, bounded on either side by gorges, and is thus completely surrounded with cooling vapour. Less than 5 inches of rain ordinarily fall in the four months, November to February, and nearly 300 in the three months June, July, and August. In spite of its enormous rainfall Cherrapunji is neither an unhealthy nor an unpleasant place of residence. The plateau is admirably drained, and the water is quickly carried off. Much of the rain falls at night, and the number of hours of sunshine is considerable. The Civil Surgeon stationed at Cherrapunji, in a report submitted to Mr. Moffatt Mills in 1853, stated that he had a high opinion of the climate of the Khasi Hills, and that an excellent site for a sanitarium could be selected either

at Cherrapunji itself, or at a place a little further to the north. He pointed out that the temperature varied little from the mean, the maximum in summer being 83° , the minimum, registered at sunrise in January, 43° . The rainfall certainly was heavy, but even of this the Civil Surgeon made light.

“During four months in the year a great quantity of rain falls at Cherra; on an average about five hundred inches in the twelve months. Nevertheless I do not consider that it rains here for a greater space of time, if so great, during the year, as it does at other hill stations. The two I allude to are Mussoorie and Darjeeling, with both of which I am well acquainted. When rain falls here it usually comes down in great quantities (as much as 24 inches sometimes fall in 24 hours); but in consequence of the hard and sloping nature of the surface, the station is perfectly dry an hour or two after the rain has ceased. Also the rain falls here principally in the night, as a proof of which I may mention that up to the present date (24th August) 348 inches have fallen this year; of this quantity 276 inches have fallen during the night between the hours of 6 P.M. and 8 A.M. and the remainder, *viz.*, 72 inches and 85 cents only has fallen during the day between the hours of 8 A.M. and 6 P.M.

Also Cherra is very much more free from being constantly enveloped in clouds and mist than the hill stations above alluded to generally are during the rainy season. From this circumstance and from the good coal fires kept here, a well built house with a good thatch is much drier than houses in the plains of Bengal are during the rainy season, as a proof of which, paper which was placed on a room four years since now looks as good as new.”

But, though the rainfall may not have a prejudicial effect upon the health of the inhabitants, its action on the physical features of the country is in proportion to its violence. This action has been admirably described

**Effects of
heavy rain-
fall.**

by Mr. Oldham, in the paper to which reference has been already made and from which the following extract is reproduced.*

“It will not be easy for those who have been accustomed to investigate countries where the average annual fall of rain amounts to thirty or forty inches, distributed with tolerable equality over the whole twelve months, to form a fair estimate of the immense forces brought into play in these hills, where the fall of rain in 24 hours is not unfrequently two feet six inches, or equal to the whole year’s fall in most places in Europe, and where the annual fall, not distributed over the twelve months but concentrated into four or five, amounts to some fifty feet, or six hundred inches!

I took an opportunity of visiting one of the streams in these hills after a heavy and sudden fall of rain. The water had then risen only about thirteen feet above the level at which it stood a few days previously; the rush was tremendous—huge blocks of rock measuring some feet across, were rolled along with an awful crashing, almost as easily as pebbles in an ordinary stream. In one night a block of granite, which I calculated to weigh upwards of 350 tons, was moved for more than 100 yards; while the torrent was actually turbid with pebbles of some inches in size, suspended almost like mud in the rushing stream.

To the denuding force of these heavy and sudden falls of rain is also due the almost total absence of any soil in the flats of the hills near the southern escarpment. All has, in fact, been washed away, and a thin crop of coarse grass alone finds sustenance on the rocky surface. The marked absence of trees, the growth of which is cut off as with the axe along the edges of every flat, is largely due to the same causes but also largely to the blighting storms which sweep over these hills. On the sloping sides of the valleys trees grow abundantly, and at many places luxuriantly: there they are sheltered, and abundantly supplied with moisture.

But this water exerts its degrading forces not only on the surface of the flats, or where, in rushing over the precipitous scarps it excavates deep basins beneath, but it pours through the many fissures and clefts in the sandstone and limestone, and springs from the solid face of the rocks at different levels, tearing with it fragments of the hardest masses, and precipitating them into the gorges below.

* Memoirs of the Geological Survey of India, Vol. I, Part 1, p. 174.

The rapid degradation which these hills must undergo is well shown by the vast amount of suspended matter, which is carried down by the streams issuing from them during the rains. I have more than once seen streams which in the drier weather, were beautifully pellucid, so turbid and charged with suspended matter, that a white card was invisible at the depth of one inch and a half! that is, through a stratum of water of that thickness. I have also measured the bulk of such sediment allowed to subside in a carefully divided tube, and found it more than once to amount to one-fifth of the total bulk, and in one case to very nearly one-third. In all cases this sediment was a fine clayey sand. Taking these facts in connection with the enormous fall of rain, it will be readily seen how rapid must be the degradation and denudation of these hills."

Jowai, which lies north-east of Cherrapunji, also suffers from an excess of moisture, and the average rainfall there is about 237 inches. But these enormous rainfalls are by no means common to the district as a whole. The clouds are soon drained of their moisture, and, though Shillong is only 22 miles as the crow flies from Cherrapunji, the average rainfall there is only 82 inches in the year, a figure which, for Assam, is comparatively low. April is a drier month than is usual in that Province, and more than five-eighths of the total rainfall is precipitated in the four months June to September. The climate of the higher hills is exceedingly salubrious. There are no records of temperature available, but on the hottest days in summer the thermometer in a bungalow in Shillong seldom rises above 80° Fahrenheit. On the high plateau which extends from Upper Shillong to Serrarim, the temperature is appreciably lower, and it is cold enough to make fires pleasant on a wet evening even in the height of summer. In the winter there are often frosts at night, but snow

Rainfall in
other part of
district.

seldom falls. The total rainfall for December and January is only three quarters of an inch, and the advent of the rain clouds is generally accompanied by a rise in temperature. There was, however, a fairly heavy snowfall on January 9th, 1899.

Storms.

Destructive storms are practically unknown. Strong winds, however, blow from the west from the middle of February to the middle of April.

Earth-quakes.

The Khasi Hills like the rest of Assam is a seismic area, and slight earth tremors are so common as to excite little attention. Considerable damage was done to houses by a shock which occurred in September 1875, and widespread havoc was wrought by the great earthquake of June 12th, 1897. This earthquake was felt over an area of 1,750,000 square miles, from Rangoon on the south-east to Kangra on the north-west, and serious damage was done to masonry buildings over an area of 145,000 square miles.* The area of maximum disturbance was a tract of country of the shape of a cocked hat, whose base line ran from Rangpur to Jaintipur, while the top of the crown was near Barpeta. The first shock was felt at Shillong about 5-12 P.M. Its advent is thus described by the Deputy Commissioner. "The first shock, which was comparatively slight, was preceded by that rumbling underground noise since so familiar, but was accentuated within a few seconds with such severity that every masonry

* Memoirs of the Geological Survey of India, Vol. XXIX, page 52.

building in Shillong was levelled with the ground. The direction was roughly from south-west to north-east. The Secretary's residence on the hill above the Ward lakes, in which my wife and I were living, collapsed at once, as we stepped out upon the lawn, and the magnitude of the disaster was revealed immediately by the roar of the water escaping from the Ward lakes, which rushed down a ravine, and damming up the stream Umkra, destroyed the iron bridge leading to the polo ground, driving the heavy iron girders a considerable distance up stream." Government House was converted in a few seconds into a heap of stones, and the Chief Commissioner and his wife, who were seated in their dog cart under the porch, but narrowly escaped from death.

It was most fortunate that the earthquake occurred as it did, in the afternoon, when, after a wet day, nearly every one was out of doors. In spite of the collapse of every masonry building, there were only 29 deaths in Shillong, 10 of which occurred in the Secretariat Press. The only Europeans killed were Mr. McCabe, C.S., the Inspector-General of Police, and Mr. Rossenrode, a pensioner of the Survey Department. The sufferings of the people, who had suddenly been rendered homeless, were increased by the inclemency of the weather. Rain fell continuously for twenty-four hours, and people were compelled to seek shelter in huts, out-houses, and stables. Food, clothing, bedding, and all that goes to make life comfortable were buried under heaps of stones. There was a complete, though temporary, dislocation of the water supply, and this, coupled with the exposure and hardships

to which all were subjected, was the cause of much sickness. The telegraph line was broken, many of the bridges on the Gauhati road were wrecked, and for a short time Shillong was completely cut off from communication with the outer world. Telegraphic communication with Gauhati was, however, resumed on June 16th, and on the 8th of July the road was once more open to cart traffic. Outside Shillong there were 887 deaths most of which occurred in the villages which are situated in the deep valleys amongst the southern hills. These casualties were principally due to the falling of the hill sides, which carried the houses with them, or buried them in a shower of rocks and earth. The villages in which the mortality was highest were Shella (117), Laitiam (86), Nongwar (59), Cherrapunji (31), Maosmai (27), Sohbar (24), and Laitkynsew (19). Shella is situated on a steep slope overhanging the Bogapani, and the northern end of the village subsided in a landslide. Most of the other casualties were due to avalanches of rocks and earth, which buried the houses in the villages and the people working in the fields. Public health was bad for a year or two after the earthquake, but, except in the southern hills, the natives of the district lost but little. To people living in the neighbourhood of Shillong it was a positive source of wealth as labour for some time commanded fancy prices. The station was soon rebuilt and in a very short space of time there was nothing to suggest that such a thing as an earthquake had ever taken place. A full account of this terrible catastrophe will be found in Vol. XXIX of the Memoirs of the Geological Survey of India.

The fauna of the district include elephants, mithan **Fauna.** (*bos gaurus*) buffaloes, tigers, leopards, bears, probably *ursus torquatus* and *ursus malayanus*, wild pig, wild dogs, of which there are two varieties, the smaller and the larger, presumably *cyon dukhunensis* and *cyon rutilans*, the serow, which is, however very rare, and four kinds of deer called by the Khasis *ka sir*, *ka bthong*, *ka bthel*, and *ka skei*. Sir William Hunter states that wolves are found,* but it is probable that these so called wolves are only the larger variety of wild dog. Foxes, too, are occasionally seen in the hills. Small game include duck and teal in the lower valleys, black and marsh partridge, jungle fowl, dorick, woodcock, and snipe. In 1903 one person was killed by an elephant and 8 by tigers, and rewards were paid for the destruction of 1 elephant, 7 tigers, 30 leopards, and 40 bears. Elephants are captured either in kheddahs, or by what is known as *mela shikar*. In the latter case staunch trained elephants pursue the herd. The younger animals after a time begin to lag behind, when two of the pursuers come up on either side, and the mahouts pass a noose of strong rope round the animal's neck. For the purpose of elephant hunting the district is divided into ten *mahals*, which are put up at intervals to auction. In addition to the purchase price of the *mahal* the lessee has to pay a royalty of Rs. 100 on every animal captured. In independant territory the proceeds are divided between Government and the seims.

* A Statistical Account of Assam, Vol. II, p. 214.

Flora.

The following paragraphs on the flora of the district are based on notes received from the Director of the Botanical Survey of India.

The great undulating plateau, which constitutes the southern half of the Khasia and Jaintia range, is generally bare of trees, and the slopes of the hills are covered with grass. Here and there, however, occur open forests of the Khasia pine, often mixed with oaks especially *quercus fenestrata* and *quercus griffithii* in the western half and *quercus serrata* in the eastern. The flanks of the deep valleys and ravines intersecting the plateau are generally covered with the trees already mentioned and with other varieties such as *schima wallichii*, *castanopsis hystrix*, *evodia fraxinifolia*, as well as species of *ilex ligustrum*, and *cinnamomum*.

The broken hilly ground which forms the northern half of the district contains large stretches of dense evergreen forests in the valleys, in which nahor (*mesua ferrea*), dingnan (*schima wallichii*) *vatica lanceaefolia*, *castanopsis hystrix* and *castanopsis tribuloides* predominate, while other common trees are *engelhardtia spicata*, *stereospermum chelonoides*, *bombax malabaricum*, *lagerstrœmia parviflora*, *semecarpus anarcadium*, *careya arborea*, and *gmelina arborea*. Sal (*shorea robusta*) is found as far east as the Shillong Gauhati road. The broad ridges and spurs between the valleys are covered with high grass with clumps of forest here and there. The outer ranges of hills on the north are covered with bamboo and deciduous trees such as *dillenia pentagyna* and

gmelina arborea. Palms are abundant, belonging chiefly to the genera *phœnix*, *licuala*, *areca*, *arenga*, *calamus*, *caryota*, *chamærops*, *wallichia*. At higher elevation rhododendrons occur. Orchids epiphytic and terrestrial abound at all elevations and *sitamineæ* are very numerous. Above 5,000 feet are found species of such herbaceous genera as *raminculus*, *anemone*, *thalictrum*, *delphinium*, *geranium*, *potentilla*, *sanguisorba*, *astragalus*, *saxifraga*, *valeriana*, *senecio*, *pedicularis*, *primula*, *tofieldia iris*, and many ferns.

Dr. Hooker gives the following account of the vegetation on the southern slopes of the hills.* Dr. Hooker's account.

"Palms are more numerous here, upwards of twenty kinds being indigenous; the cultivated betelnut especially, raises its graceful stem and feathery crown, 'like an arrow shot down from heaven,' in luxuriance and beauty above the verdant slopes. This difference is at once expressed to the Indian botanist by defining the Khasia flora as of Malayan character; by which is meant the prevalence of brilliant glossy-leaved evergreen tribes of trees. Figs abound in the hot gulleys, where the property of their roots, which inosculate and form natural grafts, is taken advantage of in bridging streams, and in constructing what are called living bridges, of the most picturesque forms. Oaks, oranges, gamboge, diospyros, figs, jacks, plantains, and screw-pines are more frequent here, together with vines and peppers, and above all palms, both climbing ones with pinnated shining leaves and erect ones with similar foliage (as cultivated cocoa-nut, and Areca), the broader-leaved wild betelnut, and beautiful *Caryota* or wine-palm, whose immense leaves are twelve feet long. Laurels and wild nutmegs are frequent in the forest, with the usual prevalence of parasites, mistletoe, epiphytical orchids, ferns, mosses, and Lycopodiums; and on the ground grow ferns, beautiful balsams, and herbaceous and shrubby nettles. Bamboos of many kinds are very abundant, and these hills further differ remarkably from those of Sikkim in the great number of species of grasses."

* Himalayan Journals, Vol. II, p. 271.

According to Dr. Hooker the Khasi flora is, in extent and number of fine plants, the richest in India, and probably in all Asia. He and his companion collected upwards of 2,000 flowering plants within ten miles of Cherrapunji; in addition to 150 ferns, and a profusion of mosses, lichens, and fungi. There were 250 kinds of orchids, 25 of balsams, 20 of palms, and 150 of grasses. Wild apples, birches, and scarlet and white rhododendrons are found in the higher plateau, and in the tropical forest on the north there are figs, birches, horse chestnuts, oaks and nutmegs.

CHAPTER II.

HISTORY.

Khasi raids on Sylhet—Mr. Scott's march across the Jaintia Hills—Construction of road through Khasi Hills and massacre of Nongkhlao—Punitive measures—Submission of all the chiefs by 1833—The Khasi Seimships—System of inheritance—The Jaintia Hills—Risings in 1860 and 1862—Subsequent history—Archæology.

The history of our dealings with the Khasis and Syntengs will be found detailed in the North-East Frontier of Bengal by Mr. (afterwards Sir Alexander) Mackenzie, (pages 217-244), and need therefore only be summarised very briefly here.

We were first brought into relations with the Khasis by our occupation of Sylhet. The hillmen seem to have lived in a state of intermittent warfare with the Muhammadan fauzdar of Sylhet, and they did not abandon this objectionable practice, when that district passed into the possession of the British. The magnificent lime quarries in the hills near Cherrapunji attracted European traders to Pandua, which is near the modern mart at Bholaganj. Taken as a body these men were hardly calculated to raise the prestige of Englishmen in the eyes of the savage mountaineers, and some of the disturbances which occurred are ascribed by the Collector to their injudicious conduct. Raids and murders were by no means uncommon, and the Khasi

**Khasi raids
on Sylhet.**

problem was one of the most troublesome questions which confronted the Collector of Sylhet at the beginning of the nineteenth century. The subject is discussed at greater length in the Gazetteer of that district, to which it more properly belongs.

**Mr. Scott's
march
across
the Jaintia
Hills.**

It was, however, the Syntengs, as the inhabitants of the Jaintia Hills are called, whose country was first traversed by an official of the Company. When war was imminent between the British and the Burmese, Mr. David Scott, the Agent to the Governor-General on the north-east frontier, entered into an agreement with the Jaintia Raja. In 1824, Mr. Scott marched from Sylhet into the Brahmaputra Valley across the Jaintia Hills, and, after the cession of Assam to the British by the treaty of Yandaboo, the linking up of the Brahmaputra and Surma Valleys by a road across the hills became a question of considerable importance.

**Construction
of road
through
Khasi Hills
& massacre
of Nong-
khiao.**

In 1826, Mr. Scott won over Teerut Singh, the seim of Nongkhiao, to his side, by promising to allow him to rent some land in the Brahmaputra Valley. This chief induced the inhabitants of the States concerned to authorise the construction of a road across the hills. Bungalows were erected at Nongkhiao, the work was pushed on under the supervision of Lieutenants Bedingfield and Burlton, and for a time nothing could exceed the harmony of the relations between the Khasis and their visitors. The savage is, however, alike treacherous and suspicious, and a chance remark let fall by a chaprasi, threatening the hillmen with taxation, is said to have been the spark that fired the mine. The Khasis invited

the British officers to a conference. Burlton, suspecting treachery, declined to go, but his comrade entered the assembly unarmed, and was forthwith put to death. Burlton defended himself in his bungalow with his small guard and when night came endeavoured to draw off his party to Assam. He was, however, followed, and after a prolonged resistance overpowered and his followers to the number of about 60 killed.

This wanton outrage called for speedy retribution. **Punitive measures.** Troops were quickly hurried up from Sylhet and Assam, and the Khasis were defeated and dispersed. The course of these operations are thus summarised by Captain Pemberton: "Captain Lister, commanding the Sylhet Light Infantry, with a mere handful of men, drove the Khasis from post to post, stormed their entrenchments, penetrated into their caves and fastnesses, and by the rapidity of his movements, and the boldness of his assaults, so completely destroyed the confidence in their own prowess with which they had commenced the contest, that they latterly confined themselves to attacks upon small parties of five or six individuals for whom they lay in ambush, and rarely ventured to contend openly with any detachment, however inferior to them in numbers."*

In 1831, raids were made upon the plains of Kamrup **Submission of all the Chiefs by 1833.** and of Sylhet, but they were promptly punished, and this was the last time the Khasis dared to descend upon our territory. It was impossible for a people, divided as they were, to offer any serious opposition to

*Pemberton's North-East Frontier, p. 225.

our troops, and in January 1833 the last of the important seims, Teerut Singh, tendered his submission. Teerut Singh was confined in the Dacca jail for the remainder of his life, but his state was handed over to his nephew and heir, and engagements were entered into with the other Khasi chiefs.

These engagements will be found in the first volume of a Collection of Treatises, Engagements, and Sanads relating to India and neighbouring countries compiled by Mr. C. U. Aitchison C.S. The general clauses, which are common to most of these agreements, acknowledge the authority of the Deputy Commissioner as the local representative of Government. The right to all minerals is surrendered, on condition that Government makes over to the seim half of the royalties received, and the seim undertakes to provide Government rent free, with all land required for cantonments, and sanatoria, and to give every assistance which may be required in opening roads.

**The Khasi
Seimships.**

There are altogether twenty-five of these little states in the Khasi Hills, and they are probably some of the smallest and most insignificant communities which have ever been dignified by such a title. Not a single state amongst the twenty-five has a gross revenue of Rs. 1,000 per mensem, and in no less than twelve the gross revenue is less than Rs. 1,000 per annum. The largest states are those of Khyrim, Myllem, and Nongkhlaio. The smallest is Nonglewai, which in 1901 had a population of 169 persons, who yielded to the

seim a gross revenue of Rs. 40 per annum. The following list shows the population, revenue, and principal products of these little states.

Bhowal.—The population in 1901 was 865, and the gross revenue in 1903, Rs. 900. The principal products are rice, millet, bay leaves and black pepper, the most important mineral deposit lime. The title of the native chief is seim.

Cherra.—The population in 1901 was 8,155 and the gross revenue in 1903, Rs 7,900. Coal and iron are found, but are not largely worked. Other products include potatoes and oranges, in which there is a considerable trade, cotton, millet, betelnut, pan, chillies, ginger, and honey. The title to the seimship of the state is disputed, and on the occasion of the appointment of a new seim in 1901 there were serious riots involving loss of life.

Dwara Nongtyrmen.—The population in 1901 was 362 and the gross revenue in 1903, Rs. 100. The principal products are rice, millet, and oranges. The most valuable mineral deposit is lime. The title of the native chief is sardar.

Jirang.—The population in 1901 was 723 and the gross revenue in 1903, Rs. 2,045. The principal products are rice, millet, ginger, caoutchouc, and cotton. The native chief is known by the title of sardar.

Khyrim.—The population in 1901 was 31,327 and the gross revenue in 1903, Rs. 10,161. The principal products are potatoes, rice, millet, Indian corn, lac,

oranges, cotton and silk cloths, and iron hoes and bill-hooks. There are deposits of lime, coal and iron in the state, but they are not worked. The title of the native chief is seim.

Langiong.—The population in 1901 was 596 and the gross revenue in 1903, Rs. 120. The principal products are potatoes and millet. The native chief is known as lyngdoh.

Langrin.—The population in 1901 was 1,138, and the gross revenue in 1903, Rs. 2,050. The principal products are rice and millet. There are deposits of coal and lime in the state but only the latter is worked. The chief is known by the title of seim.

Maharam.—The population in 1901 was 8,464 and the gross revenue in 1903, Rs. 1,570. The principal products are pepper, bay leaves, honey, rice, potatoes, millet, and maize. Lime and iron are found in the state, but are not worked, but imported iron is manufactured into hoes and bill-hooks. The title of the chief is seim.

Malaisohmat.—The population in 1901 was 491, and the gross revenue in 1903, Rs. 200. The principal products are rice, millet, bay leaves, betelnuts, and oranges. There are deposits of lime in the state, but they are not worked. The title of the chief is seim.

Maodon.—The population in 1901 was 296, and the gross revenue in 1903, Rs. 1,490. The principal products are millet, oranges, betelnuts, pine-apples, and bay leaves. There are deposits of lime and coal in the

state, but they are not worked. The native chief is known by the title of sardar.

Maoftang.—The population in 1901 was 947, and the gross revenue in 1903, Rs. 145. The principal products are millet, rice, and potatoes. The title of the native chief is lyngdoh.

Maoiang.—The population in 1901 was 1,856, and the gross revenue in 1903, Rs. 300. The principal products are potatoes, millet, and honey. Lime and iron are found in the state, but are not worked. The title of the chief is seim.

Maolong.—The population in 1901 was 1,472 and the gross revenue in 1903, Rs. 1,800. The principal products are oranges, millet, betelnuts, and pine-apples. There is a trade in lime and the coal mines of the state have been leased for 30 years. The state is administered by a committee of three sardars.

Maosanram.—The population in 1901 was 1,414 and the gross revenue in 1903, Rs. 2,930. The principal products are potatoes, millet, and honey. Lime, coal, and iron are found in the state, but are not worked. The title of the chief is seim.

Marriw.—The population in 1901 was 2,289 and the gross revenue in 1903, Rs. 380. The principal products are rice, millet and maize. Lime is found in the state, but is not worked. The chief is known by the title of seim.

Mylliem.—The population in 1901 was 17,863 and the gross revenue in 1903, Rs. 7,930. The principal products are rice, potatoes, Indian corn, and millet.

The manufactures are iron hoes and baskets. There are deposits of iron in the state, but they are not worked. The station of Shillong is situated in this state and seim is the title of the native chief.

Nobosphoh.—The population in 1901 was 1,555 and the gross revenue in 1903, Rs. 500. The principal products are rice, maize, and potatoes. Lime is found in the state, but is not worked. The title of the native chief is seim.

Nongkhlah.—The population in 1901 was 9,715 and the gross revenue in 1903, Rs. 2,300. The principal products of the state are potatoes, rice, millet, and maize. The only manufactures are iron axes and hoes. The native chief is called seim.

Nonglewai.—The population in 1901 was 169 and the gross revenue in 1903, Rs. 40. The principal products are millet, rice, and potatoes. The native chief is called sardar.

Nonspung.—The population in 1901 was 1,859 and the gross revenue in 1903, Rs. 880. The principal products are rice, potatoes, and honey. Iron is found in the state but is not worked. The title of the native chief is seim.

Nongstoin.—The population in 1901 was 9,606, and the gross revenue in 1903, Rs. 7,560. The principal products are lac, honey, cotton, bay leaves, rice, and millet. The manufactures include rough pottery, cotton cloth, bill-hooks, and hoes. Lime and coal are found in the state, but only the former is worked. The native chief is known as seim.

Pamsanngut.—The population in 1901 was 288, and the gross revenue in 1903, Rs. 50. The principal products are potatoes and millet. The title of the chief is sardar.

Rambrai.—The population in 1901 was 2,697, and the gross revenue in 1903, Rs. 550. The principal products are rice, millet, cotton, and maize. The chief is called sardar.

Shella.—This state consists of a confederacy of villages ruled by four officers called wahadadars, who are elected by the people. Many lives were lost in the earthquake of 1897 and the population, which was 6,358 in 1891, had fallen to 4,358 in 1901. The principal products of the state are pine-apples, betelnuts, and oranges, which prior to the earthquake were a source of great wealth to the people. In 1897 much damage was done to the orange groves by deposits of sand. There is a trade in lime and the Mustoh coal fields are of some value. The gross revenue in 1903 was Rs. 4,172.

Sohiong.—The population in 1901 was 2,014, and the gross revenue in 1903, Rs. 600. The principal products are millet, rice, and potatoes. The title of the chief is lyngdoh.

The chiefs of these little states are generally taken from the same family, inheritance going through the female. A uterine brother usually has the first claim, and failing him a sister's son. The appointment is, however, subject to the approval of a small electoral

System of
inheritance.

body, and the heir apparent is occasionally passed over, if for any reason, mental, physical, or moral, he is unfit for the position. The electors are generally the mantries or lyngdohs, the representatives of the clans which go to form the state. The seims derive the bulk of their revenue from tolls levied at markets, the rates varying from one pice to one anna per cooly load. Their functions are chiefly magisterial, and in the discharge of these duties they are assisted by their mantries. A detailed report on the right of succession in the different states was prepared by the Deputy Commissioner in 1903. In the winter of 1901-02, there was serious rioting at Cherra in connection with the disputes of two rival claimants to the seimship. The adherents of one of these men, Roba Singh, occupied the village of Cherrapunji, and the Deputy Commissioner had to proceed to the spot with a detachment of the 43rd (now 7th) Gurkha Rifles to restore order. On April 2nd and 3rd, 1902, the two factions again broke out, houses were burnt, and three men and one woman on the side of Chandra Singh, one of the claimants, were wounded, and one man was killed and two wounded on the side of Roba Singh. The ringleaders were, however, arrested without difficulty and Roba Singh was confirmed as seim of the state.

**The Jaintia
Hills.**

The Jaintia parganas in the plains of Sylhet were annexed in 1835, as it was found impossible to obtain adequate satisfaction from the Raja for the murder of three British subjects. When deprived of his territories in the plains, that potentate resigned his possessions in

the high lands, and the Jaintia Hills were accordingly incorporated in the territories of the Company.

The rule of the Jaintia Raja over these Syntengs was of the lightest. The only taxes he received were a he-goat from each village, a little rice and wood, and the labour needed for the cultivation of the Raja's lands. The bulk of his revenue was, no doubt, obtained from dues levied on goods passing from the plains into the hills, and from the hills into the plains. For the first twenty years of our occupation, though occupation it can hardly perhaps be called, the system of administration was practically left unchanged. The hill-men continued to bring in their goats, and their various disputes were decided by the local headmen. About 1850, some slight attempt was made to administer the country by the establishment of a thana at Jowai, and in 1860 it was decided to impose a house tax.

This was an incident of British administration that ^{Risings in} had no attractions for the people, and they forthwith ^{1860 and 1862.} rose in rebellion. A large force of troops was, however, close at hand, and before the revolt could make any head it was stamped out. The house tax was, however, closely followed by the income tax, which was imposed in 1860-61. Only 310 persons in the Jaintia Hills were brought upon the assessment list, and the total demand was less than Rs. 1,300. The tax for the first year was paid without a protest, but on January 17th, 1862, the stockade at Jowai was suddenly surrounded by a large body of men, who threatened to attack the guard. They dispersed on a few shots being fired at them, but on the 23rd a

riotous mob once more assembled and burnt down the thana. Troops were then gradually brought into the hills. The rebels stockaded themselves in their villages, and these positions were then carried by the troops. There was little loss as a rule on either side, as, as soon as the sepoys had succeeded in forcing their way into the stockade, the Syntengs disappeared into the jungle. There was never any opportunity of striking a decisive blow, and it was not till November 1863 that the last of the insurgents had surrendered. An account of the proceedings will be found in the selections from the Records of the Government of Bengal, Vol. XXXIX, but the story of this indecisive guerilla warfare is of no particular interest at the present day.

**Cause of
rising.**

The impatience of the hillmen of restraint seems to have been the main cause of the rising. The rule of their own Raja had been of the lightest. At the beginning of the eighteenth century the Jaintia Raja had owned himself the vassal of the Ahom king, but he had been unable to carry his own people with him. He submitted, but they rose as one man and massacred the Ahom garrisons that had been posted in the hills. After the Jaintia Raja had abandoned his possessions in the highlands, we left the people practically undisturbed for a quarter of a century. The only representative of the British Government was the thanadar, and all that Government did for the people was to tax them, though the imposts levied were certainly of the lightest. The Syntengs had never been conquered, and had no conception of the resources of the Indian

Empire. The Jaintia Hills had been British territory for a generation, but it had been British only in name. As long as the people were left entirely to their own devices, they had no excuse for giving any trouble, but they were prompt to resent anything so offensive as taxation. Since 1863, a European officer has been stationed in the Jaintia Hills, and the Syntengs have never on any occasion been the cause of any anxiety to the Administration.

The subsequent history of the district has been un- **Subsequent history.**
eventful, and the only incident of importance that has occurred is the great earthquake of 1897, which has already been described. After the suppression of the Khasi rising in 1833, Captain Lister was appointed to the political charge of the hills, and his headquarters were located at Cherrapunji. This place remained the headquarters of the district till 1864 when they were removed to the drier plateau of Yeodo at the foot of the Shillong range. In 1874, when Assam was formed into a separate Province under a Chief Commissioner, Shillong was selected as the headquarters for the new Administration.

There are no remains of archæological interest in the **Archæology.**
hills, apart from the memorial stones of the Khasis, and the monuments erected in memory of a few Europeans. The Khasi monoliths are a prominent feature in the landscape in almost every portion of the district. They are generally arranged in rows, varying in number from three to nine. The centre stone is invariably the tallest

and is sometimes crowned with a piece of stone the size and shape of a plate. A flat table like stone, supported on small pillars about one foot high, is placed in front of each group of three monoliths, and for each extra pair of monoliths there is an additional flat stone.

Some of these monoliths are of enormous size. At Nartiang there is a stone which is 26 feet 6 inches high, 6 feet 9 inches wide, and 2 feet 3 inches thick. These memorial stones fall into two classes, those which are elected by the family or clan in memory of their ancestors, and those erected by children in honour of their parents. They are generally placed near paths where they will be continuously in the public eye, and are often far away from the place where the ashes of the person in whose honour they have been erected, are buried. At Cherrapunji there are several fine platforms built of solid masonry on which the seims of the Cherra State, or their near relations, have been burned. There is a large obelisk of solid masonry in Cherra station, erected to the memory of Mr. David Scott, the Agent to the Governor-General on the north-east frontier, and an almost equally imposing monument, a little to the north of the village, which commemorates an old Khasi woman who died in 1903. At Nongkhlaoh there is a monument to Lieutenants Bedingfield and Burlton, who were murdered by the Khasis in 1829, and at Shillong there is a monument erected in memory of the Chief Commissioner, Mr. Quinton, and the other officers who were killed during the disturbances in Manipur in 1891.

CHAPTER III. POPULATION.

Area and density—Towns and villages—Growth of population—
Migration—Sex—Marriage—Infirmities—Language—Caste and
tribe—The Garos—The Khasis and Syntengs—The Lalungs—
The Mikirs—Religion—Animism—Christianity—Other reli-
gions—Occupations.

The area of the district is 6,027 square miles, the **Area and density.**
population in 1901 was 202,250, and the density is thus
34 to the square mile. The density in the two sub-
divisions of Shillong or the Khasi Hills, and Jowai or
the Jaintia Hills is practically identical. Figures are
not available for any minor unit, but the bulk of the
population is probably living in the central and southern
portions of the hills.

The district contains one small town, Shillong, and 1,839 **Towns and villages.**
villages. These villages are quite unlike the fortified
posts which are occupied by the Nagas on the east.
Head hunting, with all its attendant horrors, was unknown
even before our occupation of the country, and there was
nothing to keep the population together. The result is
that nearly all these villages are small hamlets with less
than 500 inhabitants and in many of them there are not
more than three or four houses,

**Growth of
population.**

Mr. Mills, in 1853, reported that the population of the district was estimated to be 119,000 souls. The abstract in the margin shows the population recorded in 1872 and at the subsequent enumerations, and the percentage of increase in each

Population.	Per- centage variation.
1872 ... 140,356	
1881 ... 167,804	+19.5
1891 ... 197,914	+17.9
1901 ... 202,250	+2.1

decade. A synchronous census in these hills has up to the present day been found impossible, and a part of the large increase that occurred prior to 1891 was possibly due to the perfecting of the machinery of enumeration. The great earthquake of 1897 was chiefly responsible for the want of progress during the last decade of the century. Less than a thousand people were actually killed, but the earthquake was succeeded by a period of exceptional unhealthiness. It was followed by incessant rain, and owing to exposure, anxiety, want, and bad food, dysentery and fever were prevalent throughout the district. The water-supply seems to have been in some way affected, and bowel complaints were unusually common. The Reverend Dr. John Roberts, whose experience of the district extended over nearly thirty years, reported that he had never seen such a high mortality as occurred in 1898 and 1899. The earthquake was also followed by a marked decline in the birth rate, a fact which received ample confirmation from the census tables. In the Khasi Hills the increase was less than one per cent, but in the Jowai subdivision, where the effects of this great disturbance were not so severe, it was over five per cent.

There is very little movement into or out of the hills, **Migration.** and over 96 per cent of the persons censused there in 1901 had been born within the boundaries of the district. There were less than 4,000 immigrants from other districts of the Province, nearly 1,300 of whom came from Sylhet, while Kamrup and the Garo Hills accounted for about half of the remainder. More than three-fourths of the foreigners, or persons born outside the Province, were living in Shillong. Further details with regard to immigration will be found in Table III.

Women in the hills considerably exceed the men in **Sex.** numbers, and in 1901 there were 1,080 females to every 1,000 males. Were it not for the foreign population the proportion would have been much higher, as amongst the Khasi and Synteng tribe there are 1,143 women to every 1000 men. Amongst the Garos and Mikirs who were living in the district, the men slightly exceeded the women in numbers. Women amongst the Khasis enjoy a position of unusual dignity and importance. Inheritance is traced entirely through the female line, women and girls move about as freely and enjoy quite as full a life as men, and their numbers are not reduced, as in some other parts of India, either by premature parturition or neglect.

The following is a brief description of the marriage **Marriage.** customs of the Khasis. For further details reference should be made to the monograph on the tribe.

At a marriage the parties are pronounced man and wife in the presence of their friends, and a feast usually

follows. The essential part of the ceremony consists of the mixing of liquor from two different gourds, representing the two contracting parties, and the eating by the bride and groom out of the same plate. The bride at first remains in her mother's house, where she is visited by her husband, but when children are born, the parents, if they continue satisfied with one another, set up housekeeping together. This union between the sexes is, however, hardly worthy of the name of marriage as it can be terminated at will by the contracting parties, and, as the initial ceremony costs but little, a man is not deterred from changing his wife by the expense of obtaining a new partner. Divorce is very common, and is effected by a public declaration, coupled with the presentation by the man to the woman of five cowries or copper coins, which she returns to him with five similar coins of her own. He then throws them away, and the whole ceremony is complete. The public proclamation is occasionally dispensed with, and the marriage is dissolved by the simple tearing of a pan leaf. The temporary character of the Khasi marriages can be judged from the fact that one man, who did not look more than 35 or 40 years of age, admitted to a missionary that he had been married 37 times. In such cases the women remain in their own homes, and suffer no material inconvenience from the departure of their fickle husbands. The facility with which divorce can be obtained renders adultery or intercourse prior to marriage, uncommon. Marriage, in fact, is merely a union of the sexes, dissoluble at will, and the people have no

temptation to embark on secret intrigues. A woman who commits adultery is, moreover, regarded with extreme disfavour, and according to the Khasi code of morals, there is only one thing worse, and that is to marry in one's own clan. A widow is allowed to remarry, but not into the family of her late husband, a practice exactly the converse of that prevailing in the Garo Hills, to the west. Infant marriage is practically unknown, and in 1901 out of the 38,000 married women in the district only 516 were less than 15 years of age. The proportion of potential mothers, *i.e.*, married women between 15 and 40 is comparatively small. In 1901, they formed only 144 per mille of the total population, as compared with 157 per mille in the Province as a whole, and 169 per mille in the Central Provinces.

The abstract in the margin shows out of 10,000 males **Infirmities.**

	Out of 10,000 males number afflicted with—				the number in the

Assam ...	10	9	13	5	the Indian Empire
India ...	12	6	5	3	afflicted with the

four special infirmities selected for record at the census. Blindness is the only infirmity which is at all common. The proportion of blind people has always been higher in the hills than in the valley, and it is probable that the confined and smoky atmosphere of the hillman's hut has an injurious effect upon the eyes. The district has always been unusually free from leprosy. This is somewhat noteworthy as large quantities of dried but

most malodorous fish are imported into it from Sylhet, and, according to Doctor Jonathan Hutchinson, it is to fish of this description that leprosy is largely due.

Language.

The principal languages spoken in the hills are Khasi, which in 1901 was returned by 59 per cent of the population, Synteng, which is closely akin to it (27 per cent), and Mikir (6 per cent). Khasi and Synteng are said to belong to the Mon-Khmer family to which Mon-Palaung and Wa belong. At the present day these languages are spoken in Pegu, in the hilly country near the Mekhong, and in Cambodia. In Assam this special form of speech is only found in the Khasi and Jaintia Hills, and nearly all the other aboriginal languages with which it is surrounded belong to the great Bodo family. The Mon-Khmer languages have something in common with the Munda family, and, though it would be too much to say that they have a common origin, they have a common substratum over which have settled layers of other speech. Garo is a member of the Bodo group and Mikir occupies an intermediate position between the Bodo and the Naga languages. For further details with regard to these various forms of speech reference should be made to the Linguistic Survey of India by Dr. Grierson.

**Caste and
Tribe.**

From the racial point of view the population of the district is extraordinarily homogeneous. Khasis, Syntengs, and Native Christians, who are all practically one tribe, form 85 per cent of the total population, Mikirs form 6 per cent, Garos 3 per cent, and Lalungs another Bodo people, 2 per cent.

The Garos are members of the great Bodo family, and **The Garos.**

Males	...	...	3,001	are akin to the Kacharis,
Females	...	...	2,767	Rabhas, Meches, and cognate

tribes. They are said to be a section of the Thibeto-Burman race, whose original habitat, it has been suggested, was the country near the upper waters of the Yang-tse-kiang and Ho-ang-ho, and who spread in successive waves of immigration over the Assam Valley. Though akin to most of the aboriginal tribes of the Assam Valley, they belong to quite a distinct stock to that from which the Khasis sprang. According to their own traditions they came from Thibet and settled in Kuch Behar. Here they lived for about 400 years, but were finally driven southwards into the hills which bear their name. In appearance the Garos are squat and sturdy, with oblique eyes, large head, thick lips, and large and ugly features which have a peculiarly flattened appearance. Their costume is of the scantiest. The men wear a narrow cloth which is passed between the legs and fastened round the waist, and which does not really cover the part it is intended to conceal. The woman's cloth, which is of the scantiest description, is fastened round the body below the navel, and only reaches a few inches down the thigh. But what they save in clothing they spend in jewellery, and there are few women in the world who are so prodigal in earrings, though it is for quantity not quality that they are conspicuous. Girls will sometimes wear in a single ear as many as 60 brass rings, each $6\frac{1}{2}$ inches in circumference and weighing altogether nearly 2lbs. The result of this

custom is that the lobes are enormously distended, and the bottom of the ear almost reaches to the shoulder. The Garos live as a rule in long houses built of bamboo, and are most omnivorous feeders. The tribe is divided into certain local groups called *jals*, and the Garos who have settled amongst and intermarried with the Khasis are known as Migams. A more detailed account of the Garos and their customs will be found in the monograph on that tribe.

**The Khasis
and Syntengs.**

The Khasis and Syntengs are a short and sturdy race.

Males	...	...	72,492
Females	...	...	82,906

They have flat noses, thick lips, eyes which are generally obliquely set, and fair complexions. Their language differentiates them from the other tribesmen of Assam, and their indifference to tradition and readiness to accept new customs, is a dividing line which separates them from the other peoples of India. A detailed monograph on the tribe is under preparation by Major Gurdon, the Deputy Commissioner of the district, and, as they form the great bulk of the population of the district, their manners and customs will be found described in the appropriate sections of the Gazetteer.

The Lalungs.

The Lalungs are a Bodo tribe, the great bulk of whom

Males	...	...	1,582
Females	...	...	1,679

are living in Nowgong. A certain number of Lalung villages are, however, to be found in the hills to the north of the Jowai subdivision. Most of the tribal legends describe them as having been originally located in the Khasi and Jaintia Hills, and as moving into the

plains because they disliked the principle laid down by the Khasis that all property should descend through the female. According to another tradition they were originally settled near Dimapur, but moved into the hills to escape the disagreeable duty of providing the Kachari Raja with a daily ration of six seers of human milk. The tribe is divided into a number of clans whose names suggest a totemistic origin, and all of which, except the Masorang, are exogamous. The rule of inheritance is peculiar. A woman may either enter her husband's clan, or the husband may enter the wife's, but all property and children of the marriage belong to the clan which was adopted at the time of the wedding. In the days of native rule the Lalungs are said to have offered eight human victims annually to their gods.

According to Colonel Dalton, the Mikirs were origi- **Mikirs.**

Males	...	...	6,583	nally settled in the North
Females	...	...	6,260	Cachar Hills, but were
				driven westward into Jain-

tia territory by the Kacharis. Dissatisfied with the reception accorded to them there, they sent an embassy to the Ahom governor at Raha, offering to place themselves under the protection of his master. But the luckless delegates were unable to make themselves understood and they were, forthwith, buried alive in a tank which that officer happened to be excavating. Hostilities ensued, but the Mikirs were soon suppressed, and were settled in the hills that bear their name, though a considerable colony are still

to be found in south Kamrup and the northern slopes of the Khasi Hills. They are divided into four tribes—Chintong, Ronghang, Amri, Dumrali—and these tribes are again subdivided into various exogamous groups. In the hills the Mikirs live by *jhum* or shifting cultivation and raise crops of cotton, chillies, rice, and vegetables. All the members of a family live in one house, which is thus of considerable size. Their religion is of the usual animistic type, and is chiefly concerned with the propitiation of evil spirits. Infant marriage is unknown, and sexual license within the tribe prior to marriage is tolerated. Further information with regard to the Mikirs will be found in the monograph on that tribe.

Religion.

Classified by religion the population of the district in 1901 was distributed as follows:—Animistic 88·2 per cent, Christians 8·5 per cent, Hindus 2·7 per cent, and Muhammadans 0·6 per cent.

The natural religion of the Khasis does not differ in essentials from that of the other tribesmen of Assam. They believe in a future state, but do not trouble themselves much about it. Misfortunes are attributed to evil spirits, and steps are at once taken to ascertain who it is who is offended and how he best may be propitiated. Egg-breaking is the system of divination usually employed, and is thus described by Mr. Shadwell:—

“ Each case of sickness or other calamity is attributed to the influence of some evil spirit, and the first step is to ascertain what particular spirit has been at work, and for this the great institution of egg-healing is brought into play. An expert (but not a professional) sits down before a board, in the centre of which he places an egg on a few grains of rice; after invoking the egg to

speak the truth, he sweeps the rice off the board, excepting one grain left on any spot fancy dictates. Then naming a particular spirit, he asks that if he be the cause of evil, a part of the shell of the egg may be deposited near the grain of rice; he then strikes the egg sharply on the centre of the board. This process is repeated, if necessary, till the required information is obtained. The next thing is to discover what sort of offering will be acceptable to the spirit. This is ascertained in a precisely similar way, but the desired result is often not arrived at till much time and many eggs have been expended."

A Khasi will not start on a journey or undertake any business of importance, without first ascertaining by this means whether the result is likely to be favourable.

The Khasis recognize a principal god or creator, to whom a cock or goat should be sacrificed each year. The ancestors of the family and clan are also worshipped, but the whole question of the religion and customs of the Khasis is discussed at length in the monograph on the tribe, so that any detailed disquisition here would be out of place. One of their superstitions is, however, so curious that it cannot be allowed to pass unnoticed. The tradition runs that there was once in a cave near Cherrapunji a gigantic snake or *thlen*, which caused great havoc amongst men and animals. At last, one man, more venturous than his fellows, took with him to the cave a herd of goats, and offered them one by one to the monster. The snake soon learnt to open its mouth to be fed at a given signal, and the man then made a lump of iron red hot, threw it into its mouth, and killed it. The body was then cut up and eaten, but one small piece remained, from which sprang a multitude of *thlens*. These *thlens* attach themselves to different families, and bring wealth

and prosperity, but only if they are from time to time fed on human blood. To satisfy this craving a human being must be killed, and the hairs, the tips of the fingers, and a little blood offered to the snake. Many families are known or suspected to be *Ri thlen*, or keepers of the *thlen*, and murders are not unfrequently committed in consequence of this awful superstition. Another quaint superstition which exists among the Syntengs is that of *Taro*, or the casting out of the devil. In olden days a person who considered that his persistent ill-fortune was due to the presence of some malignant spirit in his house, threw all his property out of doors and abandoned it, in the hope that the devil would go with his goods and chattels. At the present time such a person contents himself with throwing away one or two worthless articles.

Christianity. The Khasis have, however, shown themselves peculiarly susceptible to the influences of Christianity. The Welsh Calvinistic Methodists opened a mission in the hills in 1841. During the first quarter of a century they made very little progress, and by 1871 they had only succeeded in converting about 500 persons. The work then received a great impulse from the labours of the Reverend Jerman Jones and Dr. Griffiths, a medical missionary, and the number of converts grew apace. In 1881, there were 1,895 Native Christians in the district, in 1891, there were 6,941, and in 1901, no less than 17,125. Classified by sect, the mission had, according to the census returns, 1,796 converts in 1881, 6,766 in 1891, and 15,937 in 1901. In 1905, according to their own returns, the missionaries

had a following of about 23,000 souls, while from 1,000 to 1,500 converts are annually admitted into the church. The process of conversion originally seems to have been fairly logical. The Khasis ascribed most of their misfortunes, physical and material, to the agency of evil spirits, and their religion largely consists of the propitiation of these demons. When they found that the medicines of the early medical missionaries did them more good than their ancestral pujahs, they were inclined to question the truth of their own beliefs. The Khasi religion in itself possesses few attractions, and there are no ties of caste or social or family restrictions to act as an obstacle to conversion. On the other hand, the fact that converts are debarred from attending markets on a Sunday, that they are deprived of the benefit of unrestricted divorce, and that drunkenness is forbidden, acts as a deterrent to the less spiritually minded members of the tribe. The Christians are, however, the most prosperous and the most civilized section of the community, and this is a fact which is bound to exercise a great influence upon the people. It would hardly be too much to say that now-a-days it is the correct thing in the Khasi and Jaintia Hills to be a Christian. Good houses, good clothes, cleanliness and prosperity are the outward and visible signs of the members of the church. The old Khasi religion is becoming a genuine paganism, a religion of the villages. The more advanced and better educated section of the community have outgrown it, and Christianity is the only religion ready to their hand to take its place. The schools of the district are in the hands of the missionaries,

and the children thus come early under the influence of Christian thought and principles.

In addition to the Welsh Calvinists, there is a Roman Catholic Mission which in 1905 had, according to their own returns, about 900 converts. There is also a small community of members of the Church of England, numbering altogether about 400 souls, who have two small churches at Sokha and Jowai. The Welsh Mission employ altogether twenty-one missionaries in the hills, eleven of whom are ladies. They are stationed at the following places :—Cherrapunji, Jowai, Laitlyngkot, Mairang, Maoflang, Shangpung, Shella, Wajijer, and Shillong. The Roman Catholics have six missionaries and ten sisters in the district. The missionaries are stationed at Shillong, Cherrapunji, and Laitkynsew, and at Raliang and Lamin in the Jowai subdivision. Work was first begun by the Roman Catholics in 1890.

Other religions.

More than three-fifths of the Hindu, and more than half of the Muhammadan population of the district were enumerated in the town of Shillong. Neither of these creeds possess any attractions for a Khasi. Other religions which had a few followers were—Sikhs (9), Jains (3), Buddhists (55), and Brahmos (83).

Occupations.

In 1901, 76 per cent of the population returned agriculture as their means of occupation, a proportion that was lower than that returned for any British district in the Province. This was partly due to the fact that in a sparsely populated district like the Khasi and Jaintia Hills, the inhabitants even of a little town like Shillong

form an appreciable section of the total population. Over 11 per cent of the people, considerably more than half of whom were women, described themselves as supported by general labour. Some of these persons were, no doubt, employed in the coal mines and lime quarries of the district, and others in carrying loads to the different markets situated in the hills, for the Khasi is an indefatigable trader, but most of them were to some extent supported by cultivation. The occupations of the people in 1901 were distributed under 520 heads, details for which will be found in the report on the census taken in that year. Such a classification is, however, too elaborate for a district like the Khasi and Jaintia Hills, and an examination of these figures would serve no useful purpose. The number of persons returned under each of the eight main orders was as follows :— Government, 2,490 ; pasture and agriculture, 155,641 ; personal service, 2,553 ; preparation and supply of material substances, 12,108 ; commerce, transport and storage, 3,420 ; professions, 2,295 ; unskilled labour, not agricultural, 23,131 ; means of subsistence independent of occupation, 612.

CHAPTER IV.

AGRICULTURE AND FORESTS.

Crops raised—Rice—Millets—Maize and Job's tears—Potatoes—Oranges—Pan and black-pepper—Areca nut—Bay leaf—Cinnamon—Experimental farms—Agricultural implements—Livestock—Bee-keeping—Forests.

Crops raised. The staple crops raised by the Khasis are wet and dry rice, various kinds of millets, maize, potatoes, a small tuber called *sokphlang*, cotton, pineapples, oranges, betel-nut, pan, and bay leaves, and in the gardens round their houses vegetables, pulse, and occasionally sugarcane. There are no statistics to show the area under each crop.

Rice : wet rice.

Wet rice is grown in the valleys with which the hills are intersected, both in the Bhoi country and the northern portion of the high plateau. The inhabitants of the hills near Cherrapunji depend for their rice supply upon the plains of Sylhet. About the middle of February, or even earlier, the villagers turn the water on to their fields. This water is allowed to remain for three or four weeks till the soil is thoroughly saturated, and is then drained off. The land is hoed up twice, and the water turned again on to the fields for another ten or fifteen days. The ground is then hoed up two or three times, and harrowed till it has been reduced to a fine puddle, and the seed is sown in May or June. The system followed varies, however, in different portions of the district. On the

higher plateau the villagers often hoe the ground only once and puddle the soil by driving cattle over it. When the plant is about six inches high, water is again introduced, and allowed to stand for about two months, when it is let off for a few days to allow the field to be weeded. After weeding it is again let in, and is not drained off till the crop is ripe for the sickle in October or November. Rice is hardly ever transplanted, except to a small extent in the Bhoi country, and the plough is only used in the Bhoi country and the Jaintia Hills. The fields on which wet rice is grown are usually well manured with cowdung.

Upland rice is grown on the hillsides. About the middle of September, the soil is lightly hoed up and the grass with the earth attaching to the roots allowed to dry. In February, these sods are collected into little heaps and burnt, and a few weeks afterwards, when the spring rains fall, the ashes are scattered over the ground. The field is then hoed up, and the rice sown in April or May. In the neighbourhood of Shillong dry rice is generally sown on land from which a crop of potatoes has been already taken, and where this is the case only a light hoeing is required. Harvesting goes on on the high plateau in October and November, but in the lower hills it sometimes lasts till the end of December. High land rice is seldom grown twice running on the same spot, and after one crop a fallow period of four or five years is usually allowed.

After the paddy has been reaped it is piled up in stacks in the field and left for two or three weeks, as that

Dry rice.

**Threshing,
etc.**

renders it easier to thresh. Cattle are not used for this purpose as in the plains, and the villagers either tread out the grain with their feet, or beat it out with a stick, or take it up in handfuls and beat it against a stone. The grain is then winnowed by being allowed to fall from some height on to the ground, and is stored in great drums made of bamboo mats. When required for food it is husked in a large wooden pestle and mortar. The straw is sometimes used as fodder, or is burnt and used as manure, but is more generally thrown away.

Millets.

Millets are of three kinds—*raitruh* (*eleusine coracana*), *raishan* (*paspalum sanguinale*) and *raisoh*. The first and the last are grown on land covered with bamboos or trees which have been felled and burnt as they lie. The soil, which has been manured by the ashes of the jungle, is not even hoed up, and the seeds are dibbled in amongst the ashes. The crop is sown in April and May, and reaped about six months later. On the Shillong plateau *raitruh* is generally sown amongst the potato plants, whereas in the War country it is raised in separate fields. *Raishan* is grown on the hillsides of the high plateau after the ground has been well hoed up and pulvarized. It is sown about a month later than the other two varieties, and reaped at the same time. Millet is threshed in the same way as rice.

**Maize and
Job's tears.**

Maize is either grown in garden ground or is sown in the potato fields at the time when the tubers are earthed up. It is usually sown in April and May and ripens

in August or September. The maize fields are well hoed, and are treated with manure. Job's tears (*coix lachryma*) are usually sown on high grass land, in conjunction with potatoes, *raitruh* or *sohphlang*. After a single crop the land is allowed to lie fallow for four or five years. The seed is sown between May and June and reaped in November and December.

Potatoes are extensively grown on the higher slopes, and **Potatoes.** in lower land which has been well drained. They were first introduced in 1830 by Mr. David Scott, and were much appreciated by the Khasis. In 1881-82, the recorded export of potatoes from the Province amounted to 127,000 maunds. Five years later the tuber was attacked by a disease due to the presence of a fungus (*phytophthora infestans*), and in the following season the crop is said to have rotted in the ground. In 1887-88, the total export of potatoes fell to 42,000 maunds, or little more than one-third of the exports of the previous year. This was a great decrease, but it was followed by a still further depression in the potato trade, and for the next thirteen years the annual exports never amounted to as much as 30,000 maunds. Bottom was reached in 1899-00, when the total reported exports only amounted to 5,000 maunds. The tide then turned, and in 1903-04 the exports nearly reached 51,000 maunds. This great improvement was due to the introduction of the Naini Tal potato in 1897. This tuber yields a fine return, and is not nearly so susceptible to disease as the indigenous variety. In considering the figures of export it must be borne in mind that these figures are

for the Province as a whole, and that owing to the system under which they are collected they cannot lay much claim to accuracy.* It is, however, doubtful whether any appreciable quantity of potatoes is exported from any portion of the Province except the Khasi Hills. Two crops are raised in the district. The first is sown in February and March, and is gathered in June and July, the second is sown in July and August, and is harvested in November and December. The turf is pared, and the sods are laid in long ridges and burnt. Holes are then dug about nine inches deep, and the same distance from one another. These holes are partially filled in with loose earth, and a potato, which is often divided into two halves, is placed in each. They are then filled up with dry manure and soil. When the plant is about six inches high, the ground about the roots is loosened and the plant earthed up. Potatoes are also grown on land which is cropped from year to year. Each hole receives a handful of cowdung, and the yield is greater than when grown on the hill-side. The *sohphlang* (*flemingia vestita*) is either grown between the Job's tears, or on land which has already yielded a crop of potatoes. It is sown in March and April and gathered in the winter months, and is always eaten raw.

Oranges.

Oranges are grown along the southern base of the hills from Nongjri in the east to Law on the border of

* Most of the potatoes are carried by country boat, and the traffic registrar at Bhairab bazar has no means of compelling the boatmen to answer his enquiries or of testing the accuracy of their replies. No effective check can be exercised upon his tables.

the Garo Hills. The plantations extend from the foot of the hills to a height of about 1,500 feet, and are carried up the ravines which score the southern face of the high plateau. A few trees are grown in the neighbourhood of Shillong, 5,000 feet above the level of the sea, but at this elevation they do not do well. The soil of the War country, as the southern face of the hills is called, is very fertile, though outwardly it seems to be composed of rocks and pebbles. Oranges do best on limestone soil, and the trees at Tyrna enjoy a great reputation, but many of the plantations have been put out on soil in which there is very little lime. The trees are generally raised from seed which is selected with great care. The pips are placed in water, and only the ones that sink are used. They are sown on a layer of earth about nine inches thick, which is shaded from the sun and sprinkled with water at night. The plants are left here for four months or so till May or June, and are then transferred to a nursery where they stay till they are two or three years old. Trees are also occasionally propagated from cuttings, a somewhat speedier method than that of raising them from pips.

The first step to be taken when preparing a plantation is to cut and burn the jungle and weed out the roots of *ikra*. The ground is then put out with plantains, and when they have attained a reasonable size, orange trees, jack-fruit trees, areca palms, and bay trees are planted in their shade. This transfer from the nursery to the plantation takes place in May or June, and at the end of the rains, the young orange trees are pruned. After

three years the plantains are dug out, as by this time the other trees are firmly established, and periodical weeding is all that is required for the upkeep of the plantation. Orange trees begin to bear when they are six or seven years old. They suffer much from the depredations of a borer, and heavy rain in April is injurious.

The export trade is in the hands of Bengalis, most of them natives of Sylhet, who visit the gardens and the local markets such as Therria, Bholaganj, Maodon, Lyngkhat, Shella, Ballat, Ranikar, Maobang, and Tallab. Chhatak is the centre from which oranges are consigned to Calcutta. In 1903-04, it was said that more than sixty million oranges were exported from the Province. Little reliance can, however, be placed upon these figures. Thirty to thirty-two oranges make one *bhar*, and 100 *bhars* one *shispah*. A *shispah* sells in ordinary years for from Rs. 10 to Rs. 20, but when the crop has been a poor one the price sometimes runs as high as Rs. 45.

**Pan and
black-pep-
per.**

Pan and black-pepper are very much alike. The first is a very important crop and is grown extensively along the southern border of the district. The cultivation of black-pepper is very limited. Both are creepers, and require trees for their support. Poma (*cedrela toona*), jack, betel-nut, and two or three other kinds of trees are generally thought to be most suitable. Both *pan* and pepper are propagated from cuttings, which require a moist and shady situation, and in dry localities recourse

is had to artificial irrigation, the water being carried to the gardens in bamboo pipes. Decayed wood, which also serves as a manure, is placed over the roots of the vines to keep them moist and cool.

Pan begins to yield leaf two or three years after it has been planted. The leaves are gathered at intervals of three or four months from fully matured plants, and are counted as follow :—one bundle or *tap* contains 160 leaves and 20 *taps* make one *kuri*. The normal price of a *kuri* of *pan* is from Re. 1 to Rs. 3, prices being lowest in the rains and highest in March and April. Black-pepper begins to bear four years after it has been planted. The berries ripen in December and January and, after plucking, are cured by drying in the sun.

Betel-nut is a profitable crop and ranks in importance **Areca nut.** with oranges and *pan*. It is grown all along the southern face of the district up to an elevation of 1,500 feet. The betel-nut tree is raised from seed. The seed-nuts are taken from selected trees, and are sown in a nursery and the seedlings, when two or three years old, are transferred to their permanent quarters. The palms are planted out with oranges and other trees, and the plantations require no cultivation beyond a weeding twice a year. The trees begin to yield when eight to ten years old. A good tree will bear four bunches containing about 600 nuts, but two bunches per tree is the more usual rate. The nuts ripen at the beginning of the year and are collected between February and May. Green nuts

also are plucked for sale. Ripe nuts are cured, when so desired, by steeping them in a tank for several months.

Betel-nuts are counted as follows :—10 nuts make 1 *gai* or *kynti* ; 40 *gais* make one *bih* or *kani* ; 16 *bihs* make one *lynti*. A *kani* of nuts (400) sells from As 10 to Re. 1.

Bay leaf:
tespat.

Bay trees are generally allowed to seed themselves, and the young shoot, when required, is dug up and transferred to the plantation in May or June. The trees begin to yield when from eight to ten years old. The twigs are lopped off with a *dao*, and the leaves, when dry, are packed in long bamboo baskets each of which holds about 25 seers. The usual price obtained by the growers for bay leaf is Rs. 4 to Rs. 5 per maund.

Cinnamon.

The Khasi cinnamon is not a cultivated product but the tree grows wild in the warmer parts of the district. When it is proposed to convert it into spice, the tree is cut down, the twigs are cut into sticks about two feet long, the outer skin or cuticle is scraped off with a knife, and finally the bark is stripped off and dried.

Experimental farms.

In 1873, an experimental farm was opened on the high plateau of Shillong at an elevation of about 5,900 feet above the level of the sea. Experiments were made with new varieties of potato and different kinds of fruit trees, but the farm was not successful. It had been started on somewhat ambitious lines with a European Superintendent, and in the two years 1874—76 it showed a deficit of Rs. 23,000. Financial considerations at that time

rendered it impossible to devote so large a sum to agricultural experiments, the Superintendent was discharged and the farm, after being carried on for a few years on a much more modest scale, was finally abandoned altogether. Cattle, sheep, and pigs had been imported at considerable cost from England, but in 1875-76 disease broke out in a virulent form and nearly all the animals died.

In 1897-98, an experimental farm was opened once more in almost the same locality. Experiments made with wheat, barley, and oats were not successful, but a considerable stimulus was given to agriculture by the introduction of new varieties of potato. The old Khasi potato had seriously deteriorated, and the Naini Tal variety, which was imported to the farm, has practically become the potato of commerce in the hills. The plant is liable to blight, and new varieties have to be imported to the district at intervals of a few years. The system of storing fodder in silos for use in the dry months of winter was introduced and is being adopted by the Khasis. A model dairy was started in 1900 in connection with the farm and proved extremely profitable. The Khasi cows are poor milkers, but such milk as they give is unusually rich, and the butter made was of exceptionally good quality. Two private dairies were subsequently opened, and the Government dairy was abandoned. With the object of improving the indigenous breed of cattle a herd of cross bred English cows and a bull were imported from Patna in 1902, and two Bhutia cows in 1903. The latter are a cross between a

mithan bull (*bos frontalis*) and a Thibetan cow. English and Australian pigs were also purchased in December 1902, and have been breeding well.

An experimental fruit garden was opened in 1902, at an elevation of about 5,300 feet above the level of the sea. Fruit trees of all kinds have been planted, but the fact that the rains break so early in the year is a serious obstacle to their due development. A tropical plantation was opened in 1904 at Wahjain on the southern face of the Khasi Hills, at an elevation of about 1,000 feet above the level of the sea. A large number of spices and tropical fruits have been planted out. Coffee and arrowroot have already been grown successfully by Khasis in this locality. Experiments have also been made with tea on the high plateau, and attempts have been made to introduce the cultivation of silk. Seed of the univoltine worm was procured from France, and the cocoons were sent to that country for valuation. They were priced at about Rs. 240 per maund of dry cocoons, which is equivalent to Rs. 80 per maund of green cocoons, or four times the price ordinarily obtained in the silk-rearing districts of Bengal. It is hoped that the industry may be adopted by the Khasis and steps are being taken to plant mulberry trees in the hills.

**Agricultural
implements.**

The ordinary agricultural implements of the Khasi are a hoe with a short handle and a triangular head, affixed not at a right but at an acute angle to the shaft, a sickle (*rashi*), three or four kinds of daos or bill-hooks, a

harrow (*ka moi*), a crowbar, which is used for the construction of irrigation channels, sieves, and winnowing baskets. The plough used by the Syntengs resembles the one in use in the plains of the Province.

The livestock of the Khasis consist of cattle, goats, **Livestock.** pigs, and poultry. The cattle are a sturdy little breed, and are only kept for food and for their manure, the indigenous Khasi leaving all the milk to the calf. Buffaloes are kept in the neighbourhood of Shillong by Nepalese herdsman. They are not used as draught animals and the bullocks used on the Shillong-Gauhati road are all of the white Hissar breed. The small and sturdy Manipuri ox, which is not unlike the Khasi animal has proved most successful as a draught animal on the Imphal-Dimapur road, a fact which suggests that a trial might be given to the animals of the Khasi Hills. The Khasi pig is of the ordinary black variety. Sheep and poultry, including turkeys, are reared for the Shillong market.

Considerable quantities of honey are consumed and **Bee-keeping.** sold in the Khasi Hills, the ordinary price paid for honey in the comb in the Shillong bazar being 3 to 4 annas per lb. The bees from which this honey is obtained are of two kinds, the *lywai* or large wild bee, and the *ngap*, a smaller variety which is not unfrequently domesticated. The *lywai* invariably make their nest in the clefts of high and inaccessible rocks, and are smoked out and generally suffocated before any attempt is made to take

the comb. The *ngap* live in hollow trees and in holes under stones. The Khasis take advantage of this habit to prepare suitable nests for the swarms when they come up from the valleys in the summer, and when they have settled in these places catch and hive them. This is done by simply searching for the queen bee and carrying her off, and if the swarm offers any resistance they are smoked enough to stupefy but not to kill them. The nests are generally traced by the deposits left by the bees. When once these have been found the Khasis go to the spot early in the morning while the air is still quite clear, and note the direction from which the insects come. The native form of hive is a hollow piece of wood about two and a half feet long and one foot in diameter, with a door at either end. The bees are of a migratory character and generally spend the winter in the valleys, returning to the high plateau towards the end of May.*

Forestr.

The hills were probably at one time covered with a dense growth of timber, but fires and the system of *jhum* cultivation have practically denuded the high plateau, and the remains of the forest are only to be seen in the magnificent sacred groves which now crown the summits of the higher hills. In 1874, when the Viceroy visited Shillong he directed that steps should be taken to reserve certain tracts for the growth of timber, and in 1877 the following areas in the Khasi Hills were set

* *Vide* enclosures to letter from Secretary to Chief Commissioner No. 4431, dated 16th August 1882, to the Government of India in the Revenue and Agriculture Department.

aside for the purpose; twenty blocks were also reserved in the Jaintia Hills.

Subsequently the Jirang and Narpuh forests were added to this list. In these reserved tracts trees can

only be cut under a pass from the Deputy Commissioner, but the villagers are themselves expected to keep the fire lines clean. In 1878, a block of land, fifty square miles in area, near Saipung in the south-east corner of the Jaintia Hills, was constituted a reserve. This forest is said to contain a quantity of nahor (*mesua ferrea*), and sam (*artocarpus chaplasha*), but up to date it has not been worked. Certain forest blocks which cover altogether a few square miles of land have also been reserved in the neighbourhood of Shillong. They contain little but pine, and have been taken up with the object of protecting the station water-supply, or of forming a fuel reserve, or for some other purpose. These blocks are (1) Upper Shillong; (2) Riat Laban and Kench's trace; (3) Laitkor, Laitumkhrah, and Block No. II; (4) a tree nursery reserve; and (5) the Barpani forest. A staff consisting of one deputy ranger, one head guard, and eight guards is maintained in the district, and royalty is levied on all forest produce imported into the plains. If this produce has come from Khasi territory royalty is levied at half the usual rates and the Seim is allowed to collect the other half.

The forests on the northern ranges and on the southern faces of the hills have already been described in the paragraphs on the flora of the district. The most valuable timber trees are, on the north, sal (*shorea robusta*), and nahor; and on the south nahor, poma (*cedrela toona*), champa (*michelia champaca*), and gundroi (*cinnamomum glanduliferum*)

CHAPTER V.

MISCELLANEOUS.

Arts and industries—Lac—Food and dress—Rents and wages—
Prices—Economic condition of the people—Communications—
Navigable rivers—Post and telegraph—Trade—Shillong—Cher-
rapunji—Jowai.

The arts and industries of the Khasis are described **Arts and industries.** in the monograph on the tribe. They include the manufacture of earthenware pottery, iron implements, baskets and mats, jewellery, and cotton cloths. The Khasis make pots, like the Hiras, by laying on the clay in strips without using the wheel. Reference has already been made to the iron industry in Chapter I. Baskets and mats are made of bamboo and cane, and durable nets from the fibre of the pineapple. The jewellery is decidedly artistic, and includes coronets, belts, and silver tassels which are hung from silver ropes. A description of this jewellery with illustrations of the different articles manufactured will be found in a monograph on the Gold and Silver Wares of Assam published at Shillong in 1905. An account of the system of weaving will be found in a monograph on the Cotton Fabrics of Assam, published by the Superintendent of Government Printing at Calcutta in 1897. The fishing industry, as is only natural in a mountainous country, is not of very great importance. Fish

are occasionally netted but more often poisoned with plants called *khariw*, *sohramthein*, *jaiur*, and *sohlew*, or occasionally with lime.

Lac.

Lac is generally reared on arhar (*cajanus indicus*), and on two shrubs which are called by the Bhois *snam nongdak* and *thesit*. The method of propagation is as follows:—Pieces of stick lac containing living insects are placed in baskets, and tied on to the twigs of the tree on which the next crop is to be grown. After a few days the insects crawl on to the young branches, and begin to feed and secrete the resin. They are left undisturbed for about six months, and the twigs encrusted with the secretion are then picked off. Ants and the caterpillars of a small moth sometimes do much damage to the insect, and a heavy storm at the time when they are spreading over the tree will destroy them altogether. The lac produced is exported in the crude form of stick lac. Most of it is reared by Bhois and Mikirs in the Bhoi circle on the Nowgong and Kamrup borders.

Food and dress

The staple food of the people is rice and curry. They also consume considerable quantities of dried fish and are fond of most kinds of meat, and more especially of pork. Some of the Syntengs abstain from beef, but the Khasis have no scruples on the subject. Milk, like the rest of the hill tribes, they will not touch, and unlike their neighbours on the east and west they do not eat dogs. The unconverted hillmen are heavy drinkers, and distil a strong spirit from rice. Native Christians and Pagans alike consume large quantities

of tamul pan, a proceeding which has a most disfiguring effect upon their mouths. The ordinary village man wears a small kilt, a sleeveless coat, and a cloth cap with peaks in front and at the rear. Khasi women wear a narrow cloth as underclothing, a striped cloth tied round the waist, and another cloth with a fringed border knotted on both the shoulders. Synteng women wear a cloth smoothed round the body fastened above the bust and reaching to the ankles, with a shawl that is thrown over the shoulders and knotted in front. Both Khasi and Synteng women wear a cloth tied over the head, and chemises are now coming very generally into fashion. Civilized Khasis affect knickerbockers, which are often of white flannel, stockings, and boots, with European coats and waistcoats. Their calves and thighs are generally designed upon a very ample scale and the effect is not artistic.

The ordinary villager's house is a low dirty building. The thatched roof reaches nearly to the ground, and the walls are of planks or plastered reeds. On the southern portion of the high plateau, the walls are sometimes built of stone. There is a porch in front flush with the ground, and behind are two rooms with boarded floors. Wealthy Khasis build very comfortable cottages of a European pattern.

Land is not often sublet amongst the Khasis, but flat **Rents and Wages.** rice land in the valleys is occasionally leased out, the owner generally taking about a quarter of the gross produce. For land required for orange groves on the

southern slopes of the hills, the proportion of the produce taken by the landlord is one-third. The customary rate of wages in the villages for hired labour is six annas a day for a man and four annas for a woman.

Prices.

Prices, as is only natural, are high, as the district does not produce sufficient grain to feed the inhabitants, and the cost of transport from the plains is heavy. The ordinary price of common rice in Shillong ranges from 8 to 10 seers for a rupee. In Jowai it is generally about two seers a rupee cheaper. Of recent years there has been a general tendency for the price of rice and salt to fall. In 1880, only 5 seers of salt were procurable at Shillong for a rupee; in 1905 the same sum would purchase $8\frac{1}{2}$ seers. Salt is much dearer at Jowai than at Shillong, as that place is not connected by a cart road with the plains. The prices of rice and salt in 1880, 1890, 1900, and subsequent years will be found in Table V.

Economic condition of the people.

The people as a whole are well-to-do. They are enterprising and industrious, and are not hampered by that spirit of conservatism which in many parts of India is so fatal to all progress. On the southern slopes of the hills, the Khasis, prior to the earthquake, made large profits from lime, oranges, and areca nut. Since that date their profits have been reduced but are still considerable. The fact that the headquarters of the Administration are located at Shillong puts a large sum of money in circulation from which the people in the neighbourhood cannot fail to reap their profit. The Khasis have succeeded in keeping nearly the whole of

the trade of the district in their hands, and this in itself must be a considerable source of wealth.

A fine cart road runs through the district from Gauhati, on the Brahmaputra, to Cherrapunji. From here a bridle path connects the high plateau with the plains of Sylhet. This road enters the district at Barnihat 16 miles from Gauhati. There are dak bungalows at Barnihat, Nongpoh (30 miles from Gauhati) and at Umsning or Naia Bungalow (45 miles). Shillong itself is $63\frac{1}{2}$ miles from Gauhati. The road has been carefully aligned, and is metalled and bridged throughout. Pony tongas ply between Gauhati and Shillong, the journey being usually performed in between eight and nine hours. The introduction of a service of motor cars is under consideration. From Shillong it is $33\frac{1}{2}$ miles to Cherrapunji. There are dak bungalows at that place, and at Dumpep $17\frac{3}{4}$ miles from Shillong. Six miles south of Shillong a driving road branches off to the westward to Maoflang, 9 miles further on. There is a dak bungalow at Maoflang, and the place is connected by a bridle path with the Cherrapunji cart road, which it joins $1\frac{3}{4}$ miles north of the rest house at Serrarim, and 10 miles north of Cherrapunji. The scenery through which these roads pass is extremely picturesque. Forty-two miles from Gauhati the road emerges from the forest, and winds its way through rolling grassy hills. The Umiam is crossed 9 miles from Shillong, and the road then mounts to the Shillong plateau, through fragrant pinewoods from which a magnificent view is obtained of the gorge of the

Communica-
tions. Cart
roads.

Umiam and the slopes of the Dingiei hill. From Shillong there is a climb of about 900 feet along very easy gradients to the high plateau, and from there to Dumpep the route lies through grassy downs. From Dumpep the road runs for the most part along the edge of the deep ravine of a tributary of the Therria river. The bridle path from Maoflang to Serrarim traverses the beautiful gorge of the Bogapani, and crosses that river by a suspension bridge.

Bridle paths. From Maoflang a bridle path runs north and westward through Sohiong (7 miles), Mairang (15 miles), and Nongkhlao (25 miles) to the border of the Kamrup district 30 miles beyond Nongkhlao. There are inspection bungalows at Mairang and Nongkhlao. This was the old road which connected Assam with the Surma Valley before the headquarters of the district were transferred to Shillong. From Sohiong a road runs westward through Nongstoin to Swangiri near the frontier of the Garo Hills, a total distance of 85 miles, and connects with a bridle path running west from Tura. There are inspection bungalows at Kynchi (13 miles), Nongkasen (24 miles), and Nongstoin (35 miles). From Shillong a bridle path, the first three miles of which are fit for wheeled traffic, runs eastward to Jowai, 34 miles away. There is an inspection bungalow at Maolyngkneng, 16 miles from Shillong. From Jowai a bridle path runs southwards to Jaintiapur in the plains of Sylhet 30½ miles away. There are inspection bungalows at Jarain, 12 miles, and Syndai, 22 miles from Jowai.

Another path runs eastward through Shangpung, Raliang, and Khonshnong, up to the bank of the Kapili river opposite to the hot springs. It is 32 miles in length, has one inspection bungalow at Shangpung, 13 miles from Jowai, and connects with a bridle path that runs westward from Haflang in the North Cachar Hills. These are, however, only the principal bridle paths maintained, and all over the country there are Khasi paths which are generally passable by a mounted man.

Across some of the streams that intersect these hill paths the Khasis have constructed living bridges. A rubber tree has been planted on either bank and the tendrils have been trained across the stream and have taken root on the further side, thus forming a bridge to which all the repairs are done by Nature herself.

In 1903-04, 94 miles of cart road and 356 miles of bridle path were maintained in the district.

The rivers of the district are not very largely used for the purposes of navigation, but canoes penetrate for a short distance into the hills from the district of Sylhet. The Hari is navigable for canoes carrying from 25 to 30 maunds as far as Borghat. The Lubha is navigable for canoes as far as Lahalein, but is dangerous when the river is swollen in the rains. Canoes can go up the Therria river, as far as Therria ghat in the winter time, and up to Sohryngkew when the river rises. They can also go up the Lakhat to Lakhat bazar. Somewhat larger boats can go up the Shella river to Shella bazar, and up the Jadukata to Rilang bazar.

**Post and
telegraph.**

In 1904, there were post offices in the district at Shillong, Cherrapunji, Nongpoh, Jowai, Laitkynsew, Maoflang, and Ishamati. The offices at Cherrapunji, Nongpoh, and Ishamati are combined post and telegraph offices and there is a departmental telegraph office at Shillong. Nearly 33,000 letters and post-cards were delivered from the post offices in the Khasi and Jaintia Hills in 1903-04. More than 1,000 savings banks' accounts were open and the total volume of deposits amounted to Rs. 1,60,000.

Trade.

The Khasis are keen traders and a considerable proportion of the population earn their living by travelling round to the markets held at different places in the district. A list of these markets will be found in the appendix. The chief centres of business are Shillong, Jowai, Cherrapunji, and Laitlyngkot. The principal exports from the district are lime, potatoes, oranges, betel-nut, pan, and bay leaves, which leave the district on the south, and cotton and lac which are raised in the northern hills. The imports are rice and other food grains, dried fish, salt, tobacco, general oilman's stores, cotton piece-goods, kerosine oil, corrugated iron, and hand woven cotton and silk cloths from the plains.

**Development
of the shop.**

The development of the shop can be traced in the Khasi and Jaintia Hills from its very earliest beginnings. Along certain roads there is always a large traffic on market days, and an enterprising woman takes her seat with a basket full of goods at the roadside. When the rains break she erects an umbrella to protect her from the inclemencies of rain and sun, and if her undertaking

proves remunerative she builds a little shelter. These tiny hovels are scarcely bigger than a dog kennel, and are only large enough to contain a human being squatting on the ground and a basket or two of goods. Yet none the less they form one end of the scale of trade whose higher notes are represented by Liberty or Harrod's stores. The Khasis even have their restaurants, and along the more frequented paths there are little sheds where tea and rolls can be purchased by the thirsty traveller. At Mahadeo, too, between Cherrapunji and Therria ghat, it is the regular custom for coolies coming up the hill to halt for a substantial meal of fish and rice.

There are only three places in the district that have any title to the name of town, Shillong, Cherrapunji, and Jowai. **Towns.**
Shillong. Shillong is situated in $25^{\circ} 34' N.$, and $91^{\circ} 53' E.$, 4,908 feet above the level of the sea. The station lies at the foot of the Shillong Peak, an elevated tract of land about four miles in length and rather more than 6,000 feet in height. It is situated on a fine plateau from two and a half to four miles in breadth, which is bounded on the north by the gorge of the Umiam. The level of the plateau here falls sharply to the river bed about 1,500 feet below, and on the north-west the view is bounded by the great mass of the Dingiei hill, whose summit is 6,077 feet above the level of the sea. To the north-east there is a magnificent view on a clear day across rolling hills to the Assam Valley. Forty-five miles away the broad stretches of the Brahmaputra gleam in the middle distance, half way between Shillong and the blue wall of hills which shuts in the valley on the north. Beyond

the outer ranges there is a chain of snowy peaks where over a hundred miles away the giants of the Himalaya tower into the air. The Shillong plateau is broken up with hills, and streams, and valleys. It is watered by the Umshirpi and Umkrah, both of which are precipitated in magnificent cascades, known as the Bishop and the Beadon falls, into a deep gorge and then unite in one stream to join the Umiam. These falls are situated a little to the west of the Gauhati road, about two miles from the cutcherry. The path to them leads through tame and uninteresting fields, which suddenly terminate in a precipitous ravine several hundred feet in depth. The station has been very tastefully laid out amongst the pinewoods, and since 1897 all the buildings have been constructed of timber, reeds, and plaster, and so are practically earthquake-proof. Shillong possesses various attractions which are not to be found in most of the hill stations of the Himalayas. There is a full sized polo ground and a fine race course. There is a charming cricket ground, excellent golf links, beautiful roads along which to drive, and fine breezy downs for a morning gallop. A hotel has recently been opened, and as soon as the place has been rendered more accessible to the outside world it will probably become one of the most popular summer resorts in India.

Shillong became the *sadr* station of the district in 1864, and ten years later the headquarters of the newly appointed Chief Commissioner. But, strictly speaking, the name is a misnomer, as the town is

situated on the plateau of Yeodo,* and Shillong is the name of the peak and of the high plateau to the west of the present station. This plateau is only about five miles from the cutcherry, not as the crow flies, but by a beautifully graded road, which, after crossing the Umshirpi, winds its way through bracken and pine-woods to the higher levels. The Committee who were appointed in 1862 to report on the desirability of Shillong as the headquarters of the district, proposed to locate the station and the sanatorium on the high plateau of Shillong, and to reserve Yeodo for a dépôt for invalid European troops and for the lines of a native regiment. Shillong is about 900 feet higher than Yeodo, and though the average rainfall is a little higher,† there is a very perceptible difference in the temperature. Most people will probably regret that effect was not given to the original proposal, and that the station was not built on the higher of the two plateaus. From a perusal of the correspondence it would appear that the difference between the two places was not clearly borne in mind. The Committee distinctly recommended that the civil station and the sanatorium should be located on the plateau of Shillong and the slopes descending thence towards Yeodo, but the Lieutenant-Governor, in his letter acknowledging the receipt of their report, expressed his approval of the removal of the *sadr* station of the district from Cherra to Yeodo. A beginning was no doubt

* Properly Yewduh, from Yew, a bazar, and duh, abbreviation of khadduh, last, i.e., the last bazaar of the series.

† In the six years 1899—1904 the average rainfall of Upper Shillong was only 13 inches more than that of Shillong station, i.e., 95 inches instead of 82.

made on the lower plateau, and when once houses and offices had been erected there, people were, doubtless, loathe to start building five miles away.

The dense pinewoods which are now such a feature in the scenery of the station do not seem to have been in existence in the early sixties. The steep sides of Shillong hill are said to have been partially clad with jungle and brushwood, but the slopes and plateau of Yeodo were mostly devoid of trees. Before the advent of the British the valley of Yeodo seems to have been very sparsely peopled. Some of the Khasis, in fact, considered it to be part of the Bhoi or low country and it was said, though apparently quite erroneously, to be a feverish place. The bazar at Yeodo, the present *burra hat*, was largely attended as it was connected with the religion of the Khasis. The place was said to be a sacred one and solemn sacrifices were offered there and dances held. On these occasions the people attending the bazar had the privilege of paying double the ordinary toll.

Shillong was constituted a station under Act V (B. C.) of 1876 in 1878. Its affairs are managed by a committee of 12 members, presided over by the Deputy Commissioner. Five of the members hold their seats by virtue of their office, and the remaining seven are nominated by the Chief Commissioner. The principal sources of revenue are a tax on houses at $7\frac{1}{2}$ per cent of their annual rental, a water and latrine rate, and a grant from Government. The total income of the station in

1903-04 was over Rs. 25,000. The rates are heavier than in other towns of the Province, and the incidence per head of direct taxation, excluding the house tax assessed on Government buildings, was Rs. 2-11-2 in 1903-04. Details with regard to the income and expenditure of the station in 1890-01 and 1900-01 will be found in Table X.

The total area of the town, including the cantonment, is nearly $4\frac{3}{4}$ square miles, and it is served by $16\frac{1}{2}$ miles of metalled and nearly 6 miles of unmetalled roads. An excellent supply of drinking water is obtained from springs rising in the Shillong range, and is distributed in pipes all over the town. The cantonment covers an area of 445 acres, and had an average annual income during the eight years ending with 1902-03 of about Rs. 6,250.

Cherrapunji is situated in $25^{\circ} 15' N.$, and $91^{\circ} 44' E.$ **Cherrapunji.** on a small plateau, from three to four hundred acres in extent, and 4,455 feet above the level of the sea. On the west it is shut in by a low range of hills, while, on the three remaining sides, the cliffs drop steeply to the river gorges by which the station is surrounded. The view from the eastern edge of the plateau is particularly striking. The ravine terminates in a semicircle of precipices, whose slopes, for a considerable height above the river, are covered with brilliant herbage or dense tree forest. Some five hundred feet below the summit, this natural glaciis ends, and an absolutely sheer wall of rock, as smooth and perpendicular as though chiselled by the hand

of the most careful mason, shuts in the valley on this side. Lower down the ravine is joined by other gorges, all of which have been carved out of the limestone rock by the rivers hurrying towards the plains, and the view is bounded by ridge upon ridge, whose precipitous slopes are clothed with luxuriant vegetation. The roar of the torrent rises from its bed several thousand feet below, like the distant thunder of surf upon the coast, and, perhaps, is most effective when the valleys are filled with mist, and there is nothing but the distant voice of the waters to tell of the depths beneath. To the south the eye travels for mile upon mile over the levels of Sylhet. The cliff rises sheer, 4,000 feet and more, from the plain, and there are no outlying ranges of lower hills to soften the transition from the mountain to the valley. On a clear day in July the spectacle is sufficiently bizarre. The whole surface of the plain seems one broad lake, dotted over with clumps of trees, and it is almost impossible to realize that this inland sea is in reality a densely peopled district. Cherrapunji itself is a grassy, marshy, plateau, with streams and pools on every side, and huge masses of lime stock rock covered with ferns and moss. The ruins of the old bungalows, which were built of solid masonry, still remain, to recall the time when in spite of its rainfall it was a small but gay European station, and the site of the jail, the cutcherry, the mess, and various other houses can still be seen. At the upper end of the plateau there is a large church and school belonging to the Welsh Presbyterian mission, while the Khasi village nestles on the crest of the first range of hills. The place is rich

alike in monuments and memories. There is a fine stone pillar erected in memory of David Scott, and a massive tomb which covers the remains of Mr. Harry Inglis who most successfully exploited the immense stores of limestone in the neighbourhood. The cemetery, which is set on a hill, affords abundant evidence that many of the poor invalids who were sent to this hill sanatorium, arrived too late to shake off the fevers of the plains. The Khasi tombs are, if anything, more noticeable than those of the Europeans.

Jowai is a prosperous village which stands on a fine ^{Jowai} triangular plateau 4,422 feet above sea level, and on three sides drops sharply to the Myntdu, or Hari river. It is situated in $25^{\circ} 26' N.$ and $92^{\circ} 12' E.$ and in 1901 had a population of 3,511 souls. It is the residence of the Subdivisional Officer and the centre of a considerable trade. The excellent houses in which nearly all the people dwell is ample evidence of the prosperity of the inhabitants.

CHAPTER VI.

GENERAL ADMINISTRATION.

General administration—Land revenue—The Jaintia Hills—Country spirit—Opium—Ganja—Income tax—Public Works—Criminal justice—Registration—Civil police—Jail—Education—Medical.

**General
administra-
tion.**

For general administrative purposes the district is divided into two subdivisions, the Khasi Hills or Shillong and the Jaintia Hills or Jowai. Shillong is under the immediate charge of the Deputy Commissioner, who is allowed one subordinate magistrate as his assistant. The greater part of the subdivision is, in theory, independent territory, and, as will be subsequently explained, some of the criminal and civil work is disposed of by the seims. The Deputy Commissioner is in political relations with these petty chiefs, but as the whole system of administration is of a very simple character, it is very seldom necessary for him to interfere.

**Land
Revenue.**

The Jaintia Hills and the following villages in the Khasi Hills are British territory :—Bairong, Jirngam, Laitkroh, Laitlyngkot, Lankadieng, Maobehlarlhar, Maomluh, Maopunkyrting, Maosmai, Maothang Sohkhylum, Marbisu, Mordon, Mynteng, Nongbah, Nongiri, Nongkroh, Nonglait, Nonglang, Nonglongkien, Nongpoh, Nongriangsi, Nongriat, Nongshluit, Nongthymmai, Ramdait, Saitsohpen, Sinai, Sinai Maoshanrut, Sohbar, Tymar, Tynriang, Tynrong, Tyrna, and Umniuh.

In the British villages in the Khasi Hills cultivators pay a tax of Rs. 2 per house. This is collected by sirdars who receive a commission of 10, and in a few cases of 20, per cent. The total receipts under this head are shown in Table VIII, and amount to nearly Rs. 6,000 per annum. Special rules are in force for the leasing of land in Shillong station.* Building sites are sold at an upset price of Rs. 100 per acre to the highest bidder, or are leased for a term of 99 years. Land not fit for building purposes can be sold at an upset price of Rs. 20 per acre. The purchaser of a building site is bound to expend a certain sum on the construction of a house, but this amount in no case exceeds Rs. 1,000 for every acre or portion of an acre and for smaller areas is less.

The Khasi system of land tenure has not as yet been sufficiently explored, and for information on this important subject reference should be made to the monograph on the tribe. According to Khasi custom land apparently belongs not to the seim or to the individual but to the clan. An individual may possess a right of occupancy, but he cannot alienate his land without the permission of a durbar of the clan.

The Jaintia Hills were resigned to the British Government by the Raja in 1835, at the time when the Jaintia Parganas were confiscated as a punishment for the murder of three British subjects. Till 1860, the only tax imposed was one he-goat, which was levied from each village, under a system dating from the times of native

**The Jaintia
Hills.**

* *Vide* page 441 of the Assam Land Revenue Manual.

rule. In 1860, a tax was levied on each house, which was stoutly resisted by the people, and, as soon as this insurrection had been quelled, the imposition of an income tax gave rise to a second revolt which was not suppressed till 1863. After the pacification of the Jaintia Hills house tax was levied at the rate of Re. 1 from the Syn-tengs, and of Rs. 2 from the Mikirs, Lalungs, and Kukis. In 1883, a full report on the land tenures of the subdivision was submitted by Mr. Heath, the Subdivisional Officer. His report and the action taken on it is summarized as follows in the Introduction to the Assam Land Revenue Manual by Sir William Ward, K.C.S.I., page clxxviii :—

“It was then ascertained that the following tenures existed, classing all lands either as low (*hali*) or high :

Hali lands were subdivided into—

(1) *Raj land*, the private property of the Raja and commonly known as *rajhali*;

(2) *Sanna and bandhari land*, being apparently land held by a kind of middlemen between the Raja and the occupants, called *Sannas* and *Bandharis*, who collected the rent and paid it to the Dalais who paid it to the Raja, the middlemen being rewarded for their trouble by rent-free grants of such land ;

(3) *Service lands*, given rent-free to Dalais, Pators, and other officers who carried on the administration ;

(4) *Village puja lands*, being land the occupants of which paid rent, which was set apart in each village for purposes of worship ;

(5) *Private lands* held by individuals, and which had been transferred from time to time by mortgage, sale, or otherwise, at the will of the owner ;

High lands were subdivided into—

(1) *Private lands*, held like *hali* private lands ;

(2) *Unclaimed land or Government waste*, which anyone might cultivate on payment of rent. This rent was supposed to go to the Raja, but the Dalais often appropriated it.

The final orders of the Chief Commissioner on this report may be summarised thus :—

(i) The house-tax on the Syntengs was raised from Re. 1 to Rs. 2 a house from 1st January 1886, the commission paid to the Dalais for collecting the enhanced tax being at the same time reduced to 10 per cent.

(ii) No land-tax was to be paid on high lands where shifting cultivation took place. The Syntengs were, however, to be given to understand that, while Government sanctioned such shifting cultivation, it would not permit any permanent occupation of high lands, or admit the growth of private rights in them, or pay compensation if such land was taken up by Government for any purpose. Where, however, foreigners or aliens cultivated such lands on payment of rent, the Dalai must pay the rent to Government, retaining only his commission.

(iii) *Rajhali* lands were to be assessed at 10 annas a *bigha*.

(iv) In the case of *private lands* it was decided not to assess a land-tax, but to maintain the principle that the form of direct taxation approved by Government in the Jaintia Hills was a house-tax, that a Synteng paying that tax is charged nothing more for cultivating private land of his own, but that anyone permanently occupying the Government land must pay rent, or revenue, in recognition of the Government right.

(v) In regard to *service lands* it was decided that the service lands of those village officials whom Government appointed or recognized, *i.e.*, Dalais and Pators, should be retained; also those occupied by Lyngdohs, *paju* officials, and Raja's servants, the latter being too insignificant to be worth touching; but that the occupants of all other *rajhali* land should pay rent."

The total area of the *Rajhali* lands is not known, and the private lands have never been surveyed or demarcated. The area of *Rajhali* lands on which revenue was assessed in 1904-05 was 12,209 *bighas*. Land newly taken up is measured up from time to time either by temporary amins or by the head clerk of the subdivisional office. The

question whether such land is *Rajhali* or private land is decided by summary enquiry on the spot. Land revenue and house tax are collected by twenty *dalais* and three *sirdars* who are elected by the people from certain specified clans, subject to the confirmation of the Deputy Commissioner. These people are remunerated by a commission of 10 per cent on their collections.

**Country
spirit.**

Country spirit is largely manufactured by the hillmen for home consumption, just as beer is brewed on farms in Europe. The still consists of a brass retort to which is fitted an earthenware still-head. Two tubes, made of wood covered with plaited straw, lead to two earthenware receivers, which are placed in two vessels of water. Spirit is distilled from rice or millet by the following method.* The rice is boiled till quite soft, and is then drained and spread in thin layers on bamboo trays. When cool it is mixed with a malting preparation and put in a square basket. This preparation saccharifies the rice. The syrup, which drips from the basket, is collected and mixed with the rice and water, and is left to ferment for five or six days. It is then distilled and yields a fairly strong spirit which is sold for from four to six annas a quart. The sale of liquor at markets and by the roadside is prohibited, and the desirability of limiting the number of stills is under consideration. The unlicensed distillation of spirit within a five mile radius of Shillong is prohibited, and the right to distil and sell liquor at three shops in that

* *Vide* Report on the manufacture and quality of country spirits in Assam by J. Weinberg, Esq., Shillong, 1904, page 15.

town is put up to auction. The prices paid for these licenses in 1900-01 and subsequent years will be found in Table IX. They generally fetch from five to six thousand rupees per annum.

There are only five opium shops in the district situated at Shillong and Nongpoh, and at Umkarto, Mynser and Langjut in the Jowai subdivision. The Khasis are not opium eaters, and the Mikirs and Lalungs in the low hills to the north are the principal consumers of the drug. Only about ten or twelve maunds are annually issued, which is not more than 3 per cent of the consumption of such districts as Sibsagar and Lakhimpur. Details of consumption and the revenue obtained will be found in Table IX. Opium.

There is one shop for the sale of ganja, which is situated at Shillong. The drug is only taken by foreigners and the total quantity issued is quite insignificant. Ganja.

The receipts from income tax in 1900-01 and successive years will be found in Table VII. For a hill district they are considerable, but this is due to the fact that Shillong is the headquarters of the Administration, and more than three-fourths of the total were realized from salaries and pensions paid by Government. The great majority of the thirty persons assessed in 1903-04 under the head "other sources of income" were traders or contractors. Income tax.

Public works are entrusted to an Executive Engineer, who is also in charge of the Kamrup district, assisted by Public Works.

three upper and three lower subordinates. In addition to the care of the public buildings the Executive Engineer is concerned with the maintenance of the line of communications from Gauhati to Companyganj in Sylhet, *viâ* Shillong, Dumpep and Maoflang, Cherrapunji, and Therria ghat. He is also in charge of the bridle paths from Shillong to Jowai, and from Cherrapunji to Shella, and of one or two other roads in the neighbourhood of Shillong.

**Criminal
Justice.**

The rulers of the petty states in the Khasi Hills are empowered to try criminal cases in which only their subjects are concerned, and which are not punishable under the Indian Penal Code with imprisonment for five years or some severer penalty. All other cases are referred to the Deputy Commissioner for disposal. Fine is the form of punishment which a Khasi seim most frequently employs. Sentences of imprisonment are occasionally awarded, but the culprit is then, as a rule, detained in the seim's house and compelled to work for him without pay. These cases are heard by the seim and his mantries in open court. The fines imposed consist of sums of money ranging from Rs. 15 to Rs. 1,100, plus in each case a pig. The fines are appropriated by the seim and his assessors, so that they have every inducement to convict and to impose heavy sentences. The Khasis are, however, a very democratic people, and any open injustice of this kind would be very speedily resented. The accused person is represented by a friend who pleads his case. Rupees 1,100 was the fine imposed for murder before the advent of the British.

If the prisoner was unable to pay so large a sum he was put to death. In the Jaintia Hills, the Subdivisional Officer is the principal judicial authority subject, of course, to the usual right of appeal to the Deputy Commissioner, and to the maximum punishment that he is empowered to impose. Petty cases are, however, often settled in the village. The jurisdiction of the High Court is barred, except in their criminal capacity over European British subjects, and the Deputy Commissioner exercises the power of life and death. Capital sentences and sentences for a term of seven years' imprisonment and upwards require, however, the confirmation of the Chief Commissioner. Appeals lie to the Deputy Commissioner from the orders of his assistants, if preferred within thirty days. No appeal lies from sentences imposed by the Deputy Commissioner of less than three years' imprisonment. The criminal work of the district is light. In 1904, 183 cases were tried by the Deputy Commissioner and his assistants, in the course of which 293 witnesses were examined.

Civil suits are decided by the seims or other local authorities provided that both parties to the case are subject to their jurisdiction, and that neither party is related to the members of the court. Other cases are heard by the Deputy Commissioner or his assistants. In 1904, 144 civil cases were tried.

The Registration Act is only in force in the civil station and cantonment of Shillong. The total number of documents registered in 1904 was only 59.

Registration.
tion.

- Garrison.** A native infantry regiment is stationed at Shillong, and there is a small volunteer corps which in 1904 had a strength of 34.
- Civil police.** The sanctioned civil police force of the district in 1903 consisted of 23 officers and 183 men, 130 of whom were armed with breech-loading smooth bore carbines. The actual police duties are light, and a considerable proportion of these men are employed on guard duty. The following stations and outposts are maintained. The figures in brackets indicate the strength of the force, at each place: Shillong (16), Jowai (22), Cherrapunji (9) Ishamati (4), and Nongpoh (6).
- Jail.** There is only one jail in the district which is situated at Shillong. It contains accommodation for 12 under-trial prisoners, and 49 male and 7 female convicts.
- Education.** The history of education in the Khasi Hills is the history of unusual progress. The Welsh Mission commenced their labours in the district in 1844, but, for some time, their efforts were not attended by any considerable measure of success. In 1853, the missionaries drew but a gloomy picture of the state of education in the Khasi Hills. The Reverend Mr. Lewis wrote as follows to Mr. Moffatt Mills:—"I regret to say that there is no regard paid to education in this country; we have tried to induce them by giving prizes, etc., but nothing seems to avail..... The chiefs give us no help, nor do they give any good example to the people.....Not one of the chiefs are able to read themselves, and the Cherra chief is a great opponent to education; both he and his headmen

are always speaking to the people of the unprofitableness of education.”* Few people are, however, less conservative than the Khasis, and during the ensuing twenty years there was a great change in their attitude. In the Report of the Inspector of Schools for Assam for 1874-75 it is said “that a much larger proportion of the Khasis know a little of reading, writing, and arithmetic than is the case, probably, in any other district of either Assam or Bengal.” There were, in that year, 73 schools attended by 1,666 pupils. Since that date the number of schools and pupils has steadily increased, and in 1900-01 there were 325 schools in the hills and 6,535 pupils. To such an extent has education spread that, in 1901, the proportion of persons able to read and write (57 per mille) was larger in the Khasi and Jaintia Hills than in any other district in the Province. This was partly due to the unusually large number of educated women. In 1901, 34 per mille of the female population could read and write, a figure nearly seven times greater than that reported from any other district. The schools are divided into four grades, high, middle, and upper and lower primary. There is only one high school in the district which is situated at Shillong. There are five middle English schools, two at Maokhar, one at Laitkynsew, one at Cherrapunji and one at Jowai.

The primary schools are scattered about the district. The number of schools of different grades, and the

* Report on the Khasi and Jaintia Hills by A. J. Mills, Esq., p. 10 .

number of pupils reading in them in 1900-01 and subsequent years will be found in Table XIII; while details of the expenditure on education will be found in Table XIV. The educational arrangements in the Khasi and Jaintia Hills are still, to a great extent, in the hands of the Welsh Mission. Government maintains a middle school for European children, a high school, and a training school at Shillong, and makes a grant to the mission for the purposes of education. But, whereas the amount expended on this object by the mission in 1903-04 was nearly Rs. 65,000, the cost to Government was less than one-third of this sum. The European school was opened in 1881, closed after the earthquake of 1897, and re-opened three years later. The number of pupils on the rolls in May 1905 was 22.

In the Jowai subdivision education is not much in favour with the unconverted tribesmen, and the majority of the children who attend school are Christians. This is not the case in the Khasi Hills, where the number of unconverted school children considerably exceeds the number of those who are Christians. The inspecting staff maintained by Government consists of two sub-inspectors. Instruction is given in the Khasi language and the text-books are printed in that tongue, but in the English character, as Khasi does not possess any character of its own. At the present day (1905) no less than six Khasis have taken the degree of Bachelor of Arts.

Vital statistics are recorded in various scattered areas **Medical.** which in 1901 had a population of 47,294.* In 1903, the figures returned show a birth rate of 30 per mille, and a death rate of 18 per mille. The latter figure is obviously too low, but it is probable that the Khasis on the high plateau enjoy a fairly long mean duration of life. Malaria is common in the Bhoi and War country, but is rare amongst the inhabitants of the higher hills. Excessive consumption of betel-nut tends to produce dyspepsia, which is occasionally followed by dysentery, and bowel diseases are not uncommon. Round worm and itch are common, ring worm is rare. Heart disease is unusually common amongst men, and difficult labour due to malformation of the pelvis amongst women. Both of these calamities are probably due to the practice which prevails amongst both sexes of carrying heavy loads, from a very early age. Cholera does not often appear in the hills, and is regarded by the Khasis with a wholesome terror. In 1879, there was a severe epidemic in the neighbourhood of Shillong. In Maokhar there were 144 deaths, which was equivalent to a death rate of 154 per mille of the population. In the village of Maopat there were 105 deaths, and many other villages in the neighbourhood of Shillong suffered terribly. On the appearance of the disease the villagers in many cases abandoned their homes, leaving the dead unburied and the sick to tend for themselves.

* The areas in question are :—Shillong station and cantonment, Jowai station Nongkrem, a group of 25 villages in the Khyrim State, Nonkhiao, Nongstoin, Maharam, Mylliem group, Marriw, Maoflang, Jirang, Sohiong group, Lait-lyngkot, Nongpoh, Cherra village and station, Shella, Maolong, Borpanji, Sohbar, Ishamati, Bhoi, Nangtalang, Nartiang, Nongbah, Mynso, Shangpung, and Nongjungi.

Dispensaries.

There is a Government hospital at Shillong with accommodation for 13 male and 4 female in-patients, and Government dispensaries at Cherrapunji, Shella, and Nongpoh. Private dispensaries are maintained by the Welsh Calvinistic Mission at Jowai and Laitlyngkot. Statistics showing the expenditure on these dispensaries and the number of cases treated will be found in Tables XV and XVI.

A vaccine depot is maintained at Shillong from which lymph is supplied to other districts in the Province. Five vaccinators under an inspector were employed in the district in 1903-04. The Khasis suffer to a considerable extent from small-pox, but, in spite of this, they do not avail themselves to any marked extent of the opportunities afforded to them. The average number of persons annually vaccinated during each of the five years ending with 1902-03 was only 25 per mille, as compared with 44 per mille in the Province as a whole. This is largely due to the fact that the unconverted Khasis regard small-pox as a powerful god, and, far from trying to avoid the disease, deliberately expose themselves to the risk of infection. This curious belief is carried to such a pitch that, amongst the Syntengs, to be heavily pitted with small-pox is looked upon as adding to the physical beauty of the sufferer.

CHAPTER I.

PHYSICAL ASPECTS.

Area and boundaries—General appearance of district—Mountain system—River system—Lakes and marshes—Geology—Economic geology—Climate and rainfall—Tornadoes—Earthquakes—Fauna.

The district of the Garo Hills is bounded on the north and west by the district of Goalpara, on the south by the Bengal district of Mymensingh, and on the east by the district of the Khasi and Jaintia Hills. It lies between 25°9' and 26 1' N, and 89°49' and 91°2' E. and covers an area of 3,140 square miles.

Almost the whole of the district consists of hilly country, though here and there along the frontier there are stretches of flat land and valleys which run up between the hills. The largest blocks of flat land are to be found at the point where the Bogai debouches on the plain, near Mahendraganj on the southern frontier of the district, and near the Rajabala and Phulbari *hats* on the western frontier.

The main range, on a spur of which the station of Tura has been built, runs through the district from north-west to south-east. Nokrek (4,652 feet), the highest peak in the range, is situated about eight miles to the south-east of Tura, and from this point the hills gradually decline in height. Kailas, east of the Someswari, is 3,375 feet above the level of the sea, and Balpakuram, on the border of the Khasi Hills, 2,831 feet. About five miles north of the Tura range, there is a much

shorter chain of hills, known as the Arbela range, whose highest peak is about 3,277 feet above sea level. The rest of the district consists of a tumbled mass of hills, whose general tendency is to run north and south. Several of the peaks are between 1,500 and 2,000 feet in height, but the general level is considerably less than this. In their original state the whole of these hills must have been covered with dense tropical forest, and much of this forest still remains. Where, however, the hillsides have been cleared for cultivation, bamboos and high reed jungle cover the sites of the fallowing *jhums*. The sides of the hills are usually fairly steep but not precipitous, but an exception should, perhaps, be made in the case of the Tura and Arbela ranges. Here, though there are few rocks or precipices to be seen, the ascent to the summit except by one of the recognised paths would be by no means easy even for a man on foot. The hills, as a rule, take the form of ridges sloping steeply to the valleys with which they are intersected, but any boldness of outline which they may possess is effectually concealed by the luxuriance of the vegetation in which they are enshrouded. The Kailas hill, which is called Chitmang by the Garos, stands out an abrupt hog-backed mass, which towers above most of the hills in the vicinity. It thus appears to be higher than it really is, and it is probably on this account that it is regarded by the Garos as the home of the spirits of the dead.

**River system. The
Krishnai.**

The district contains no river navigable by boats of four tons burthen throughout the year, and only

five which can be said to be navigable at all in their course within the hills, viz., the Krishnai, Kalu, Bhugai, Nitai, and Someswari. The Krishnai, which is called Damring by the Garos, takes its rise in the hills to the north of the Arbela range, near the village of Mandalanggiri, whence it flows in a northerly direction past the villages of Rongrengiri, Thapa, and Songma to Jira, a frontier village, where it leaves the district and enters Goalpara. This river is navigable by canoes in the cold season as far as Rongrengiri, but there is very little traffic. During the earthquake of 1897, the greater part of the bed of the Krishnai between Dekachang and Jira sank and formed a lake about eight miles long and in places nearly a mile in width. The river enters this lake near Dekachang.

The Kalu is known to the Garos as the Ganol. It **The Kalu.** takes its rise at Domagitok on the northern face of the Tura range about nine miles from Tura station. It leaves the district near Putimari and flows for about ten miles through Goalpara. It again appears near the Rangapani hill, and for about two miles forms the boundary of the district from the village Rangapani to Peshkar Bhita. It then falls into the Jinjiram, near Kakripara in the Goalpara district. Its principal tributary is the Rongkon, which rises near Tura station. The Kalu flows past the villages of Maheshgiri, Durangiri, Damalgiri, and Garobahda. It is navigable for a distance of ten miles in the hills from Harigao as far as Damalgiri, which is within twelve miles of Tura, by boats of two

tons burden, but only during the rainy season. Snags in the river bed make navigation difficult.

The Bhugai.

The Bhugai is known to the Garos as the Bugi. It takes its rise on the south face of the Tura range near Nokrek, about 8 miles in a direct line from Tura. It passes the Dalu *hat* and falls into the old bed of the Brahmaputra above the station of Nasirabad in Mymensingh.

The Nitai.

The Nitai is known to the Garos as the Dareng and takes its rise on the southern slopes of the Tura watershed. It passes the villages of Adapgiri, Chakpatgiri, Sembu, Chota Sembu, Silkigiri and Bamongiri, and at Ghoshgaon enters the district of Mymensingh, where it falls into the Kanks river. Canoes can proceed as far as Chakpatgiri when the river is full of water.

The Someswari.

The Someswari, or, as it is called by the Garos, the Simsang, is the largest stream in the district. It takes its rise on Nokrek, and drains the country between the Tura and Arbela ranges and the valley of the Rongdi. The river follows a very winding course and at first flows in an easterly direction for about thirty miles. It then takes a turn to the south and runs generally in a southerly direction, till it emerges on the plains in pargana Susang of Mymensingh. It is navigable for fair sized boats as far as Siju, about twenty miles from the point where it issues from the hills. Beyond this point dug-out canoes can occasionally be used as far as Rongkaibibra, the point of junction of the Someswari and the Rongkai river. The upper reaches of the river can hardly be described as

navigable, as the rapids are long and dangerous. The principal tributaries are the Rongkai, the Rongdi, and the Chibok.

The banks of the rivers in the hills are usually steep, and in some places they flow through deep ravines. The bed is rocky, and the scenery generally wild and beautiful. The Maheshkhali river, which forms a part of the eastern boundary of the district, flows a subterranean course for many miles under the limestone rocks which form its bed. It disappears not far from the Yindka peak, and reappears again near Billar Dhoba.

The only lake in the district is the one to which **Lakes and** reference has been already made, and which has been **marshes.** formed by the subsidence of the valley of the Krishnai. The lake was originally the site of a dense forest, but in places it is now as much as twelve feet deep. The only other *bils* of any importance are the Bara *bil* in the Kalumalupara pargana, and the Katta *bil* between Kalaichar and Mahendraganj.

The greater part of the Garo Hills are formed of **Geology.** gneissic rocks. Upon them are superimposed strata referable to the cretaceous system, which consist of sandstones and conglomerates with subordinate clays and occasional coal seams. The cretaceous beds are overlaid by rocks of nummulitic age, consisting of limestone and sandstone with interstratified shales. Above the nummulitics there are upper tertiary rocks, composed mainly of sandstones, which form low hills along the border of

the Mymensingh district. Marine fossils have been met with in the lower beds of these sandstones.*

Near Siju, on the Someswari, there is a large cave called by the Garos Dobakkol or the cave of bats, as it is haunted by thousands of these creatures. The entrance is small but it leads into a large chamber hung with stalactites, which stretches away gradually decreasing in size into the hill. The Garos have a tradition that there is an exit near Tura, but the cave has never been properly explored.

**Economic
geology.**

So far as has been at present ascertained all the coal of these hills is of cretaceous origin. There are outcrops along the southern edge of the Tura range, but the principal coalfield is situated in the valley of the Someswari near Daranggiri. This field is described by Mr. Tom De La Touche in the Records of the Geological Survey of India, Vol. XV, Part III. It is situated on both sides of the Someswari river, where it turns south in a long reach, before cutting through the main range near Jankaray village. The field is about ten miles in length from west to east extending from a little to the west of Daranggiri to Rongdim in the Khasi Hills, and about six miles from north to south from the Rongdi

* I am indebted to Mr. Bose for this brief account of the geology of the Garo Hills. The following works on the subject may be consulted. Records of the Geological Survey of India, 1868, Part I. This contains a somewhat incomplete account of the coal of the Garo Hills, but the district at that time had been neither pacified nor properly explored. Memoirs of the Geological Survey of India, Vol. VII, Part I, 1869. This contains a good account of the Shillong plateau and incidentally of the Garo Hills. Records of the Geological Survey of India, Vol. VII, Part II, which contains an account of the coalfields of the district, and a note on its general geology. Records of the Geological Survey of India, Vol. XV, Part III, which contains an account of the Daranggiri field; and Records of the Geological Survey of India, Vol. XX, Part I, 1887, which contains a note on the general geology of the Garo Hills.

stream to the Rongkai. The coal measures cover an area of about fifty square miles, but the only area in which they could be profitably worked is a tract, about twenty square miles in area, between Daranggiri and the Rengchi stream. Near Daranggiri village there is a seam exposed which is seven feet thick. Mr. De La Touche calculates that the total quantity of coal in the field must be about seventy-six million tons. This estimate is, however, framed upon very imperfect data, and it would be unsafe to act upon it without further verification. The coal varies very much in quality. Certain samples yielded as much as 52 and 48 per cent of fixed carbon, while other pieces taken from the portion of the field which Mr. De La Touche condemned as quite unfit for paying operations, had only 14 and 4 per cent of fixed carbon. Mr. De La Touche has recorded the following observations on the facilities for working the principal seam.*

“Except in the south-west corner of the field, where the strata are bent up sharply against the gneiss of the main range, they are either horizontal or dip at very low angles, and there seems to be an absolute freedom from faults over the whole area. The greater part of the seam is above the level of the principal stream, so that the coal might be economically extracted, and the mines drained by adits. Moreover, as the rock immediately above the coal is generally a fine clay rock, tolerably impervious to water, the mines would to a certain extent be kept dry by it. That part of the seam which dips below the surface of the rivers would have to be got at by shafts, but the strata above the coal, consisting of about 300 feet of sandstone and shales, would present no difficulty to the sinking of these.”

* Records of the Geological Survey of India, Vol. XV, Part III, page 178

In 1900 a prospecting license over this field was issued to Mr. G. L. Garth of Dacca, but no attempt has as yet (1905) been made to work the coal. ,

**Limestone
and pottery
clay.**

Limestone has been found on the high ground to the east of Daranggiri, but the thickness and extent of the deposit has not been ascertained. At Siju, to the south of the main range, there is a large deposit of limestone of good quality. A white, shaly indurated clay, or lithomarge, which would probably be useful as a pottery clay, occurs in most places where the cretaceous rocks are exposed, in bands of two or three feet in thickness. There is a thick deposit of it in the station of Tura, where it has been used for whitewash.*

**Climate and
rainfall.**

The station of Tura is situated on a spur of the main range, and, as it is only about 1,300 feet above the level of the sea, the temperature at certain seasons of the year is fairly high. The highest maximum and lowest minimum temperature in each month in 1884 will be found in Table I. March and April are for Assam unusually warm, and in 1885, the thermometer in the latter month rose to nearly 100°, an exceptionally high temperature for Assam. It is thought that the fact that the *jhums* are being burnt about this time may possibly tend to produce a rise of temperature. From November to February are the only really cold months in the year, as though the heavy rainfall in the summer months keeps down the temperature, it renders the atmosphere exceedingly steamy and oppressive. The average rainfall recor-

* Records of the Geological Survey of India, Vol. XX, Part I.

ded at Tura will be found in Table II. 125 inches of rain falls in the year, more than two-thirds of which are precipitated in the four months, May to August. In four other months, November to February, there are altogether less than two inches of rain.

In 1900, the northern portion of the Garo Hills was **Tornadoes.** visited by a tornado of most exceptional violence. On the 18th of April, a violent storm traversed the portion of Goalpara which lies between the Brahmaputra and the Garo Hills, and finally disappeared into the latter district. The path of the storm was only about a quarter of a mile in width, but within this limited area the strength of the hurricane was quite phenomenal. Thirty persons were killed outright in Goalpara, and eighty-eight injured. In the Garo Hills the village of Shondana, which was exposed to the full force of the wind, was utterly demolished and six persons were killed and nine injured. This storm occurred about 4 p.m. in the afternoon, and on the following day, but about two hours earlier, there was a second hurricane, which followed a line a little to the north of the storm of the 18th. It struck the village of Silkata, killing eight persons and injuring one, and blew down trees and houses. One of the killed, a boy, had his head torn off and his back broken, while three others had their heads completely smashed and their brains dashed out.

The earthquake of July 14th, 1885, was distinctly felt **Earth-quakes.** in Tura. No serious damage was done, but the record room was so severely shaken that it became unsafe, and the roofs of all the Government buildings were strained.

On June 12th, 1897, the district did not escape so lightly. Fortunately, owing to the time at which the shock occurred, *i.e.*, about 5 P.M. on a Saturday afternoon, and to the fact that there were no masonry buildings in the district, the loss of life was comparatively small, and the total death roll only amounted to twenty-seven. The public offices and the residences of the officials were rendered uninhabitable, the posts supporting them were wrenched loose, the floors buckled, and the roofs sagged. The damage done to the treasury is thus described by the Deputy Commissioner :*

"This building stood on a gentle slope, a few feet from the top of a steep hill side. It had a strong frame of timber, walls and roof of corrugated iron, and a massive plinth of cement and large stones. The plinth was 70 feet long, and 32 feet 6 inches wide, with a maximum and minimum height of 8 feet and 1 foot 6 inches respectively. The floor was of concrete and cement to a depth of 9 inches. Solid as it was, it crumbled away like a pile of sand before the first shock had stopped. The stones rolled out on all sides, and the floor was broken into little pieces. The whole building tilted over towards the *khud*, wrenching the main posts in every direction, and uprooting or breaking the smaller ones which supported the verandah."

The houses owned by the American Baptist Mission escaped, however, with comparative immunity. The reason, was, perhaps, to be found in the fact that the posts instead of being driven deep into the ground, rested, for the most part, on stones almost flush with the earth, while some of the walls were protected with stout planks, a fact which must undoubtedly have added to their capacity for resistance. There were serious landslips in the hills, and much damage was done to

* Letter No. 100 G., dated 24th July, 1897.

roads and bridges. In the plains, culturable land was damaged by sand, but, as a set-off against this, *bils* were silted up and rendered fit for cultivation. The attitude of the Garos towards the earthquake is thus described by the Deputy Commissioner :—

“The Garos generally were thrown into a state of stolid bewilderment by the earthquake. They left their fields, and retired into their village houses to await further catastrophes. The Garo belief is that the world is a square flat body, hung up by a string at each corner. There is a squirrel always trying to gnaw these strings, but to prevent it a demon was appointed. This demon, however, neglected his duty, and in order that his attention might not in the future be diverted from his work, he was struck blind. Now that he can't see, the squirrel, of course, has the best of it, and it is feared that when one or two of the strings are gnawed, the earth will be turned upside down. Another story is that Her Most Gracious Majesty, not content with the last earthquake, has ordered another and more vigorous one to be followed by a cyclone. That it is in the power of the Maharani to do so is never doubted. One man asked for a *parwana* to forbid the hill behind his house from slipping down on to him. Had the houses of the European officials in Tura not been wrecked, the Garos would have made up their minds without doubt that the recent catastrophe was the work of the Sahebs, and excited by the wild stories in common circulation they might have given some trouble.”

The larger kinds of game are common in the hills, the **Fauna-** list including elephants, tigers, leopards, bears, wild pig, and deer, of which the principal varieties are the sambar (*cervus unicolor*) and the barking deer (*cervulus muntjac*). The swamp deer (*cervus duvauceli*) is also found in the low country at the foot of the hills.

The serow (*nemorhaedus*) is sometimes seen, and wild dogs are occasionally met with. Wild buffalo are found in the valleys of the Bhugai, Nitai, and Someswari, and mithun (*bos gaurus*) are fairly common on the main

range and far down the slopes on either side. Small game include peafowl, wild duck of various kinds, snipe, partridges, pheasants, and jungle fowl. Wild elephants are much feared by the Garos, as they often injure the crops and occasionally cause loss of life. In 1904, 8 persons were killed by wild elephants, 5 by tigers, 2 by bears, and 2 by wild pigs. If the returns can be relied upon it would appear that the number of deaths due to wild animals has decreased considerably since our occupation of the country, as in the two years 1883 and 1884 it is said that 70 persons were killed by tigers alone. Rewards were paid for the destruction of 1 wild elephant, 12 tigers, 38 leopards, and 54 bears in 1904. Between 1877-78, and 1902-03, elephants were hunted on no less than 20 occasions by the Government Khedda Department, and about 190 animals were annually captured. In 1886-87, over 300 animals were caught, no less than 136 having been impounded in a single drive. Since the withdrawal of the Department from Assam, the right of hunting in the different mahals, of which there are altogether five, has been put up to auction when it has seemed expedient.

CHAPTER II.

HISTORY.

Early legends of Garos—Oppression by the Goalpara zamindars—
Enquiry by Mr. Scott into Garo raids—The Paghul riots—
Garo raids and expeditions—Posting of officer at Tura—Survey
of hills in 1870—Murder of a coolie in 1871, and punitive mea-
sures—Subsequent history uneventful.

The history of the district cannot be disassociated **Early legends of Garos.** from the history of the tribe, who form the immense mass of the inhabitants, and have given their name to the hills in which they live. The Garos are believed to be members of the great Bodo family, who are said to have entered Assam from the North-East, and to have spread in successive waves, not only over the valley of the Brahmaputra, but even beyond it to the hills of Tippera. According to their own traditions, the Garos came originally from Thibet and settled in Kuch Bihar. From there they were driven to the neighbourhood of Jogighopa, but they were again compelled to fly towards the south by the king of the country, and his ally the Raja of Kuch Bihar. Their next wanderings were towards Gauhati, where they were enslaved by the Assamese, but released by a Khasi prince, who settled them in the neighbourhood of Boko. The place was, however, infested by tiger-men, and the Garos then moved into the Habraghat pargana, whence they finally wandered into the hills in which they now are found.

**Garos
oppressed
by Goulpara
Zamindars.**

The story of the dealings of the Bengal zamindars and of Government with the Garos will be found in the pages of Mackenzie's "North-East Frontier of Bengal," (pages 245-268) and need only be briefly summarised below. In the days of Mughal rule the country lying between the Brahmaputra and the Garo Hills was occupied by powerful zamindars, who only paid a nominal tribute to the Imperial Government and enjoyed a position of semi-independence. The border chiefs with whom the Garos were principally brought in contact were those of Karaibari, Kalumalupara, Habraghat, and Mechpara. One of their duties was to protect the plains from the aggressions of the hillmen, but their principal object was to enrich themselves with trade, cotton being a valuable article of export from the hills.

**Mechpara
and Karaibari
zamindars subdue
outer hills.**

In 1775-76, the zamindars of Mechpara and Karaibari entered the hills to avenge some Garo raids of more than usual atrocity. They remained for some years in the hills and brought a considerable tract of land under their control. The principal chief of the southern hills at that time was a man called Renghta, and even he became subject to the Karaibari zamindar. This zamindar was an individual of much force of character, who tried to obtain for himself a position of absolute independence. He declined to pay his revenue, opposed all attempts to determine the boundaries of his zamindari, and it was not till 1815 that he was finally arrested.

**Enquiry by
Mr. Scott
into Garo
raids.**

The lawlessness of the zamindars in the plains was naturally enough reflected in the hills, and, in 1816, Mr. Scott, afterwards Agent to the Governor-General on

the North-East Frontier, was deputed to enquire into the matter. It could hardly be denied that action of some kind was called for, as during the ten years ending with 1816, 157 villages had been burnt by Garo raiders and 178 persons killed. The condition of affairs is thus summarised in his report—

1. Karaibari.—The chaudhury of this estate having been the most vigorous and least under control had reduced nearly all the Garos actually living on his estate to the condition of ordinary ryots, but a few of the frontier chiefs still remain merely tributary, subject to the provision of cotton on terms highly favourable to the zamindar, and paying sums of money on the occasions of Hindu festivals. Of these the chief was Renghta, who had been prevented as before shown from emancipating himself from the chaudhury's supremacy.

2. Kalumalupara had been in feeble hands. The Garos on its borders were virtually independent, though some paid a nominal cotton tribute.

3. The Mechpara chaudhury had in 1776-77 effected large conquests, but was succeeded soon after by a minor, and now only a few outlying Garo villages in the plains remained in the condition of ordinary ryots' villages, and in these the Regulations of Government were current. But in the hill tracts the Garo chiefs were merely tributary, paying cotton on terms favourable to the zamindar and occasionally admitting him as their criminal judge.

4. Habraghat.—Here the Garos on the first ranges of hills had been reduced to unconditional submission, but had been liberally treated and their Sardars transformed into Jagirdars, charged with the defence of the passes against the tribes of the interior. They were quite under the Regulation of Government.

As a result of this enquiry it was decided to completely remove the Garos from the control of the zamindars, to prohibit the levying of the illegal dues which had been the cause of so much friction, and to place the frontier markets under the direct management of Government. Mr. Scott entered into relations with 121 Garo chiefs

living west of the Someswari, and as long as he was able to give the matter his personal attention, the peace of the frontier seems to have been undisturbed.

The tribe at this time was divided into the following three sections : the Garos settled in the plains who did not differ materially from ordinary raiyats, the Garos in the outer ranges who had to some extent been subdued and were assessed to tribute, and the independent or *bemulwa* Garos who occupied the higher hills in the interior.

**The Paghul
riots, 1825.**

In 1825, there was some trouble near Sherpur on the borders of Mymensingh, in which the Garos inhabiting the lower ranges were implicated. At the end of the eighteenth century, a Muhammadan Fakir had settled here and had attracted a small following, called in derision by their neighbours *paghuls* or fools. In 1813, he died and was succeeded by his son Tippu, who, with his mother, laid claim to miraculous powers. The villagers, many of whom were Garos, were much oppressed by the zamindars. In 1825, a body of 700 men assembled to attack their landlords at Sherpur, and serious rioting took place. The *paghuls* were ultimately subdued, the country they inhabited was held to be outside the borders of the permanently settled estates, and the agrarian grievance was removed. In 1833, the *paghuls* again attempted to stir up a peasant rising, but it came to nothing.

**Unrest on
frontier.**

About this time there was a certain amount of unrest upon the frontier. On enquiry being made it was found that it was largely due to the oppressive conduct of the

officials at the Garo markets. An expedition was sent up into the hills in 1837 under a Mr. Strong. The arrears of tribute were realized without difficulty, many of the Garo villages tendered their submission, and all this was effected without any loss of life on either side.

Occasional murders still took place, and in 1848 it was found necessary to send an expedition to subdue the Dassanni Garos, who had murdered one of their headmen with all his family for the somewhat inadequate reason that he had requested the tribe to pay tribute which had been in arrears since 1834.

In 1852, the Goalpara frontier was in a very disturbed condition. Seven raids took place, in which forty-four persons were killed. An expedition was despatched into the hills, which burnt a village, but as the raiders were not surrendered, it was decided to blockade the hillmen. This was attended with a certain measure of success, as they were to a great extent dependent on the profits of the cotton trade, and some of the offenders were given up to justice. For three or four years there was peace upon the frontier, but towards the end of 1856, the hillmen broke out again, and between 1857 and 1859 there were nine raids made into Goalpara, which resulted in the loss of twenty lives.

Further disturbances occurred along the frontier, the closing of the markets proved ineffectual, and in 1861 an expedition was despatched into the hills. The troops advanced from two sides, from Goalpara and Mymensingh, and succeeded in reaching and punishing most of the offending villages. Arrangements were then made

**Raids in
1852 and 1857**

**Two expedi-
tions have no
practical
results.**

for the appointment of local headmen who were to be responsible for the arrest and surrender of offenders, but this arrangement did not extend to the hills overlooking Mymensingh. An attempt by the Susang Raja, a zamindar of Mymensingh, to levy rent in the hills led to a murderous raid in 1866, which was punished by an expedition..

Officer posted at Tura in 1867.

Government had by this time come to the conclusion that control from without would never really solve the Garo question. Hitherto it had been thought that it would be quite impossible for a European officer to exist in these malarious hills during the rainy season, but in 1866 it was decided that the experiment should be made, and in the following year Lieutenant Williamson was established on one of the spurs of Tura mountain.

The success which attended this experiment was remarkable. The Garos are naturally a cheerful, kindly race, who, when fairly treated, give no trouble, and between 1867 and 1871 nearly one hundred independent villages tendered their allegiance to the British Government.

Survey of Hills in 1870.

In 1870, when the survey of the Khasi Hills had nearly been completed, the survey party found itself at the north-east border of the Garo Hills, and it was decided to carry out a survey of that portion of the Garo territory which acknowledged British rule. The Deputy Commissioner, Captain Williamson, joined Major Austin, who was in charge of the survey party, and the two officers marched across the hills from Susang to Damra, and were thus the first Europeans to traverse the hills from Mymen-

singh to Goalpara. The only village to offer any opposition was Bangangiri, and this was overcome by the exercise of a little tact. The villagers dropped their hostile attitude, received the party, and finally tendered their submission and agreed to pay revenue to the British Government. Their example was then followed by many other independent villages.

In the following season work was again resumed till it was stopped by an unfortunate incident which occurred in March, 1871. It was necessary for the purposes of the survey to clear a station on the summit of the Mimanram mountain. Two coolies who, it is said, were unable to speak the Garo language, were deputed to collect labour from the villages of Pharamgiri and Rangmagiri which are situated near Mimanram. When they arrived at Rangmagiri they found a feast in progress, and were offered some liquor by the revellers. What happened then it is difficult to say, but it is obvious that a dispute can easily arise when one of the parties to it is half drunk, and neither side can properly understand the language of the other. The Garos threw themselves on the two coolies and attempted to make them prisoners. In the course of the struggle one of them succeeded in escaping, the other was murdered, and his head kept as a trophy.

The season was so far advanced that punitive measures were postponed till the following cold weather. The villages were visited by Captain La Touche, the officiating Deputy Commissioner, and as he was unable to arrest the murderers, a party of police was left

**Murder of
a coolie in
1871.**

**Punitive
measures.**

at Pharamgiri. In May, 1872, two of the men who were most responsible were brought in, and shortly afterwards an attack was made on the protected village of Damakchigiri by the independent villages of Kokwagiri and Bawigiri. An attack was also made on the outpost stationed at Pharamgiri. The Deputy Commissioner proceeded to this village, and occupied the villages of Kokwagiri and Bawigiri without difficulty, but Government had by this time come to the conclusion that it was no longer desirable to tolerate any so-called independent villages in the hills. The reasons which led the Lieutenant-Governor to submit proposals for their subjugation, and the steps taken to give effect to them, are thus summarised in the Bengal Report for 1872-73:

In consequence of outrages committed on our dependent villages by communities of independent Garos, the Lieutenant-Governor drew the attention of the Government of India to the absolute necessity which existed for thoroughly reclaiming that part of the Garo Hills which was still independent of control. It was stated that since the policy of direct management of the hill communities has been introduced in 1866, village after village had submitted to the jurisdiction of the Deputy Commissioner in charge, voluntarily enrolling themselves as British subjects, and proving the genuineness of their action by regular payment of the trifling dues imposed on them. It was shown that a considerable portion of the hills had been thus brought within the pale of regular government. It was explained that the Lieutenant-Governor would have been quite content to wait for the gradual submission of the remaining independent Garos had they on their part been content to live at peace with their neighbours now under our protection; but they had chosen to commence active hostilities by raiding on dependent villages, and frequently gave protection to criminals who had offended against our laws. Conduct like this threatened disturbance, not only to the peace of the Garo district, but danger to the plains of Goalpara and Mymensingh, in which on more than

one recent occasion the Garo raids had caused considerable panic. The Lieutenant-Governor proposed, therefore, to put an end to the independence of the savages inhabiting this nook in the midst of British territory, bringing them under the direct control of the Deputy Commissioner, and opening paths through the centre of the hills along which our police would patrol.

The Lieutenant-Governor's proposals met with the approval of His Excellency the Governor-General in Council, and the necessary preparations for an expedition were at once taken in hand. The Lieutenant-Governor, after consulting with Colonel Haughton, the Commissioner, considered it expedient to allow no possible chance of miscarriage in such an enterprise; and provided for the collection of at least 500 armed police, supported on the side of the Khasi Hills by three companies of regular troops. It was also decided not to commence active operations till the middle of November, by which time it was hoped the country would become tolerably healthy for men from the plains.

The expeditionary force was divided into three columns. One column, under Captain Davis, entered the Hills from the Goalpara district on the north by the Nibari Duar; a second, under Mr. Daly, entered from the Mymensingh district, on the south; the third or main column, under Captain Williamson, the Deputy Commissioner, marched from Tura, the headquarters of the Garo Hills district. It was arranged that each column should follow a prescribed route through the independent tract, visiting and enforcing the submission of all villages on its way; and it was hoped that all would meet at a central rendezvous at about the same time. Lieutenant R. G. Woodthorpe, R. E., Assistant Superintendent of Survey, was deputed to conduct survey operations in communication with Captain Williamson.

The expedition was singularly successful. Captain Williamson occupied without opposition Dilmagiri, the leading independent village, which had been concerned in the recent raids, and received the submission of all the hamlets in the neighbourhood. Mr. Daly joined him on the 14th December, after repulsing, without loss of men on his side, an attack which the Garos made on his camp.* He, too, had received tenders of submission from most of the villages on his route. Establishing themselves at Rongrengiri, Captain Williamson and Mr. Daly, while waiting

* This was at Rongrengiri. The Garos were repulsed with some loss and after this one attack made no attempt anywhere to oppose the progress of the police.

for the arrival of the Northern column under Captain Davis, visited all the Garo villages within reach, and after receiving their offers of submission, arranged for the payment of the usual small house-tax, occasionally inflicting and realising fines where opposition had been offered or orders disobeyed, and insisting on the surrender of all skulls kept as trophies of raids.

Captain Davis's column was longer on the road, and did not join the others till the 2nd January. He had, however, visited all the independent villages on both sides of his line of march, and though he had been twice attacked, he had been able to repulse the Garos and punish the offending communities without much difficulty.

During January the remaining independent villages were visited, and submitted. The Garos, convinced apparently that resistance was hopeless, accepted the terms offered them by Captain Williamson, and, have under his directions, been engaged in opening out paths across the hills in several directions, which they will be required hereafter to maintain. The survey had also completed its duty and filled up the blank which has hitherto disfigured the maps.

**Subsequent
history un-
eventful.**

The subsequent history of the district is one of quiet though not of rapid progress. The Garos are some of the most peaceful of the hillmen in Assam, and quickly settled down under a rule which was both considerate and light. Such disturbances as have occurred were of a very trifling character. In 1882, eighteen villages near Randupara, who had been requisitioned for labour required for the construction of a road from Tura to Bangalkhata, refused to obey the orders of the Deputy Commissioner. Not content with staying away themselves they threatened with vengeance any village that turned out to work, and thus effectually put a stop to the operations. The Deputy Commissioner visited the place with a guard of 100 police, and, though several hundred Garos are said to have assembled with the

intention of opposing his advance, they dispersed on learning that he had gone by another route. Most of the villages visited were found quite empty, and, as the people declined to come in and deliver up their arms, two of the hamlets were burned. This step was followed by a complete surrender, and no further trouble was experienced.

In December 1902, the native Magistrate in charge of the Goalpara subdivision reported that a large number of Garos had assembled at the Dalgoma steamer-ghat with the object of establishing Garo rule. The Deputy Commissioner of Goalpara immediately proceeded to the spot with a strong body of police, but the Garos did not attempt to offer any resistance. It appeared that they had been misled by some designing men, who had collected large sums of money with the ostensible object of establishing some wholly shadowy and unsubstantial claims to the possession of the Habraghat pargana. Notices had been posted up warning the villagers not to pay rent to the Bijni zamindars, but on the arrest of the ringleaders, the crowd dispersed without more ado.

CHAPTER III. POPULATION.

Area and density—Villages—Tura—Growth of population—Immigration—Sex and civil condition—Infirmities—Language—Tribes—Religions—Occupations.

**Area and
density.**

The total area of the district is 3,140 square miles, the population in 1901 was 138,274, and the density was thus 44 to the square mile.

**Villages—
Tura.**

In 1901, the Garo Hills contained 1,026 villages including the small headquarters station of Tura. Tura is situated in 25°31' N. and 90°14' E., on a small plateau near the base of Tura hill. It is only 1,300 feet above the level of the sea, and immediately behind it Tura hill rises to an elevation of over 4,000 feet, its almost precipitous slopes clad in dense tropical forest. There are three small bungalows on the summit of this hill owned by Government and the missionaries, and the temperature there is generally about ten degrees lower than it is in the station below. Except on this side Tura is surrounded by low rolling hills, gradually declining in height till they reach the plains some twenty to twenty-five miles away. The station contains the bungalows of the few resident officials and of the missionaries, a small jail, the public offices, the lines of the military police, a market place, and a few shops, but it is nothing more than a village, and in 1901 only had a population of 1,375 souls. The place

is pretty enough, and on a clear day a magnificent view can be obtained from the station itself, and a still finer one from the summit of the hill under which it lies. But it is small, isolated, and is generally thought to be unhealthy. Attempts have recently been made to improve the sanitary conditions by cutting the jungle in the neighbourhood. A supply of excellent water is obtained from a hill stream which is distributed over the station by an aqueduct.

The Garo villages are generally built on the side of the hills, and are unfortified. They consist, in fact, of small hamlets, containing but a few houses, and in no district in the Province are the villages so small.

The abstract in the margin shows the population recorded at each census and the percentage variation. Growth of the population.

Population.	Percentage variation.	In 1872 and 1881 it was impossible to carry out a regular enumeration in the hills, and only a rough estimate was formed.
1872 100,780		
1881 109,548	+ 8.7	
1891 121,570	+ 10.9	
1901 138,274	+ 13.7	

The district suffered severely from *kala azar* between 1881 and 1891, and it is possible that the earlier estimates were too low. Part of the increase in 1901 was attributed to imperfections in the preceding census in the plains mauzas, and the actual increase in the indigenous population was thought to be about 10 per cent.

In 1901, 90 per cent of the population enumerated in the district were natives of the Garo Hills, 6 per cent Immigration.

had been born in other districts of the Province, and 4 per cent were foreigners who had been born outside Assam. Almost all of the immigrants from other districts in the Province were natives of Goalpara, and had, no doubt, merely moved across the frontier. There is an appreciable movement back from the Garo Hills district into Goalpara, but for every person who moves into Goalpara there are four who go the other way. The bulk of the foreigners come from Rangpur and Mymensingh, two neighbouring districts of Bengal, but there are also a certain number of Nepalese.

**Sex and civil
condition.**

In the district as a whole there is a considerable deficiency of women, and in 1901 there were only 974 women to every 1,000 men. The deficiency is entirely due to the immigrant population. Amongst those born and censused in the district the proportion of the sexes was exactly equal, and amongst the Garos the women very slightly exceeded the men in numbers.

The Garos are not exclusive in matters matrimonial, and will intermarry with any person except Jugis or sweepers. Owing to the conditions under which they live, mixed marriages are, however, far from common. The proposal comes from the family of the bride, and though his parents' consent must be, of course, obtained, the wishes of the person most concerned are sometimes not consulted. Amongst the Abengs there is a very curious custom. It is considered good form for the youth selected to run away when asked to marry a girl. This

most uncomplimentary conduct must not be taken to imply that he is in any way averse from the proposal, and cases have been known in which the fugitive has sued his father-in-law elect because he let him go and gave his daughter to another man. The essential portions of the ceremony are an address from the priest and the slaughter of a cock and hen. Divorce is recognized, and widows are allowed to marry, but are expected to do so in their husband's family. Polygamy is permitted, provided that the consent of the first wife is obtained. In 1901, out of 29,000 animistic married women, nearly 2,300 were less than 15 years of age. Inheritance goes through the female, and property frequently passes through the daughter to the son-in-law. Where this is the case he is compelled to marry his mother-in-law, if she is still alive, and a man not unfrequently occupies the position of husband towards mother and daughter at the same time. When a woman dies, the family property passes to her youngest, or occasionally to her eldest, daughter. The husband is, however, allowed to retain possession of the estate if he can succeed in obtaining one of his first wife's family as his second spouse. In spite of the liberal exposure of their persons, the women are chaste and make good and steady wives, and, as far as the orthodox standards of sexual morality are concerned, compare most favourably with the Khasi women, their neighbours on the east, who swathe themselves in a multitude of garments. More detailed information with regard to the marriage customs of the Garos will be found in the monograph on that tribe by Captain Playfair.

Infirmities.

From the abstract in the margin it will be seen that the district is below the average for the Province with regard to three out of the four infirmities selected for record at the census.

Out of 10,000 males, number afflicted with—	Garó Hills.	Assam.	India.
Insanity ...	4	5	3
Deaf-mutism	8	9	6
Blindness ...	14	10	12
Leprosy ...	9	13	5

Blindness, as in all the hill districts, is unusually common, and women suffer from it even more than men. It is possible that the fires which are kept smouldering in a hill-man's hut have a prejudicial effect upon the eyesight.

Language.

Seventy-seven per cent of the population in 1901 returned Garó as their customary form of speech, 13 per cent Bengali, nearly 5 per cent Rabha, and over 2 per cent Koch, another language belonging, like Garó and Rabha, to the Bodo family. There are at least twelve different dialects of Garó, but many differ so little from the standard Awe that for all practical purposes they can be disregarded. The following are the principal varieties in use : (1) Awe, which is spoken by the inhabitants of the northern and north-eastern hills, north of the central range, as far west as the Jinari river. (2) Abeng, which is spoken in the rest of the north, in the west, and in the south as far east as the Bhugai river. (3) Chibok, which is spoken in the uplands under the central range from the Bhugai almost as far east as the Someswari. (4) Ruga, which is used in the country south of the Chibok area in the lower valley of the Bhugai. (5) Dual, which is spoken in the lower Nitai valley. (6) Atong, which is used in the lower Someswari valley right up to the borders of the Khasi Hills. Rabha has two dialects

Rangdania and Maitaria, but it is not a language of which much is known. Little also is known of Koch, but such information as exists will be found, with descriptions of Rabha and Garo, in Vol. III, Part II, of the Linguistic Survey of India by Doctor Grierson.

Judged by the standard of language, which in this **Tribes.** case is more reliable than the caste returns, as many of the native Christians are Garos, 77 per cent of the population of the district are members of the Garo tribe. Other tribes, all of which are members of the great Bodo family to which the Garos belong, are the Rabhas, Haijongs, and Koches, who amounted altogether to nearly 13 per cent of the total population. The manners and customs of the Garos are described at length in the monograph on the tribe which is now under preparation by Captain Playfair, and are referred to incidentally in the following pages.

The Haijong language is akin to Bengali, but **Haijong.** the tribe, according to their own legends, originally came from the Himalaya. The Haijongs call themselves Hindus, and their houses and style of dress resemble those of the ordinary plainsmen, but they will still eat pig, though they draw the line at fowls, beef, and snakes. They are divided into several endogamous groups, such as the Harong pariya, Bhojni pariya, Manik kuriya, Tepar pariya, Sutadal, and Mauji pariya, and at their marriage ceremonies a priest attends and kindles the sacred fire of mango wood. They worship Durga and Kali and perform the *sradh* ceremony.

Males	...	2,720
Females	...	2,538

Kochs.

The Koches are divided into three main endogamous divisions, the Dasgaiya, the Hari-gaiya, and the Anang.

Males	...	2,123
Females	...	2,210

The Dasgaiya Koches eat pig but refuse fowls, the last two subdivisions eat fowls as well as pig, but all refuse beef, snakes, and the flesh of wild animals other than deer. The houses of the Koches are built in the style of the ordinary plainsman's hut, and the men wear the *dhoti* and wrap of the Assam Valley. The women wear a smock reaching from the bust to the knees, with the exception of the Anangs, who wear a petticoat, a shawl over the trunk, and another piece of cloth round the head. The Koches worship Kali and Durga, but have no regular priest. The principal part of the wedding ceremony is a feast, and the Harigaiya and Anang Koches follow the Garo ritual and kill fowls and examine their entrails to see whether the omens are favourable.

Rabhas.

The Rabhas are a section of the Bodo race and appear to be an offshoot of the Garos. Their language is closely akin to Garo, and their original habitat seems to have been the northern slopes of the Garo Hills. Certain sections of the tribe which live on the borders of that district have no word for north and south but describe the former idea by Bhutan, the latter by Tura, a fact which pretty clearly indicates the locality from which they originally came. Most of the Rabhas have, however, left their ancestral home and settled in Darrang, Kamrup, and Goalpara. In the last named district the bulk of the tribe are to be found south of the Brahmaputra.

Males	...	3,863
Females	...	3,886

The Rabhas are divided into the following seven sections—Rangdania, Pati, Maitariya, Koch, Batlia, Dahuria, and Sangha. The Rangdania lay claim to a position of superiority, but intermarriage is allowed with the Patis and Maitariyas. Intermarriage between the first three sections and the lower subdivisions of the caste is permitted, but only on payment of a fine of about Rs. 100. The Rabhas look down upon the Garos and in their turn are treated as inferiors by the Mech. Like the other animistic tribes, they are fond of beer, pork, and chicken, but they abstain from beef. Their villages are not unlike those of the Mech, they have gardens and fruit trees, but pigs and fowls do much damage, and the homestead is very different from the green dankery of bamboos, fruit trees, and vegetables which surrounds the houses of the Assamese. Agriculture is their usual occupation and rice the staple crop grown. What money they require is usually obtained by the sale of surplus produce or work in the forests of the district.

Adult marriage is in vogue, and wives in the Garo Hills are said to be extremely cheap. As a rule they can be had for nothing, and it is only occasionally that the lover has to pay thirty or forty rupees for the object of his affections. Vermillion is smeared on the bride's forehead, a practice which does not obtain among most of the aboriginal tribes, but the essential part of the ceremony is the killing of two fowls and the feasting of the villagers. The Pati Rabhas go further than this, and model their procedure as closely as possible on the Hindu ceremony. The dead, too, are generally burned, unless an

epidemic is in progress, when it is thought that the infection might be conveyed in the smoke of the funeral pyre. Their chief god is called Rishi, and is represented by a pot of rice on a bamboo platform, to which offerings of fowls and pigs are made. After death their souls are said to be absorbed into Rishi, a Buddhistic form of doctrine, but their views on the subject, like those of other animistic tribes, are probably extremely vague.

Religion.

The Garos appear to believe in a supreme deity and in a future life, but, as is usual in the hills, the bulk of their religious activities are devoted to the propitiation of evil spirits, who are supposed to be the cause of the misfortunes that befall them. The following is an accurate description of a Garo sacrifice:—"The priest squatted before a curious flat shield of split bamboo and cane, and muttered strangely to himself, as though under the influence of some drug. A villager kept dragging a kid in a circle round and round the priest and his curious god, and each time as it passed the priest dabbed it on the head with a little flour and water. Finally a little of the mixture was forced into its mouth and it was summarily beheaded. The blood was allowed to pour upon a plate of rice, which, with the tail, was offered to the deity. The rest of the animal went to form part of the feast." For further details with regard to the religion of the people reference should be made to the monograph on the Garo tribe.

Christianity. The American Baptist Mission first opened a branch at Tura in 1877, though missionaries had been sent to Goalpara town to labour amongst the Garos in 1867, and

two Garos had been baptised in Gauhati in 1864. The efforts of the missionaries have been rewarded with a fair measure of success. In 1881, there were 656 Native Christians in the hills, in 1891, there were 1,154, and by 1901 the number had risen to 3,629, the immense majority of whom were Baptists. There were in that year seven missionaries residing in Tura, four of whom were ladies. The missionaries encourage a certain degree of independence amongst their followers, and to a great extent leave the management of the various communities to the native elders. One of the most prosperous Christian villages is situated just across the border of the district near Damra in Goalpara.

Statistics for the religions which had a considerable number of adherents will be found in Table III. "Others" are represented by 3 Jains, who were Marwari shop-keepers, and 272 Buddhists, nearly all of whom were Nepalese.

For all practical purposes the occupations of the inhabitants of the Garo Hills begin and end with agriculture. Agriculture was returned as the principal means of livelihood of nearly 96 per cent of the population in 1901, and even those who returned some other avocation on the census schedules were generally dependant on agriculture for their support to a greater or less degree. Reference will be made in a subsequent chapter to such industries as are in existence in the hills. **Occupations.**

CHAPTER IV.

ECONOMIC CONDITIONS OF THE PEOPLE.

Agriculture—Live stock—Forests—Industries—Wages—Prices—
Food—Dress—Dwellings—Prosperity of the people—Trade—
Communications—List of important forest reserves.

Agriculture.
General
conditions.

In the hills the Garos cultivate their land on the system known as *jhum*. A spot of land is selected on the hill side, and the jungle cut down during the cold season. Towards the end of March, the trees and brushwood are burned as they lie, and the rice crop is planted in April at the commencement of the rains. Shortly afterwards, the seeds of vegetables, cotton, pepper, and pulses are sown in the same clearing ; and each crop is reaped in rotation as it comes to maturity. The Abengs are, however, the only section of the tribe who sow rice in the first year that the *jhum* is cleared. The other sections begin with a miscellaneous crop. Miscellaneous crops include different kinds of yams, arhar (*cajanus indicus*), which is reared as food for the lac insect, ginger, indigo, and turmeric. In the second year, rice only is grown ; and after two years' cultivation the clearing is abandoned and suffered to lie fallow for about ten years. Neither plough nor spade is used except in the few Hinduized villages bordering on the plains. The sole implements of agriculture are a short *dao* fixed in a long handle with which the Garos clear the jungle, and a

small hoe. The cotton is short in staple and poor in quality, but contains a small proportion of seed and has been found suited for mixing with woollen fabrics.

A more detailed account of the system of agriculture practised by the Garos will be found in the monograph by Captain Playfair.

The system of cultivation followed in the plains ^{The plains} mauzas resembles in all essential details the system that prevails in the neighbouring district of Goalpara. The plough is used, and the staple crop is rice. Mustard and jute are grown for export, and tobacco is a common garden crop. Figures showing the area under different staples in the plains mauzas will be found in Table V.

The live stock of the district include buffaloes, cattle, ^{Live stock.} goats, pigs, and poultry. Buffaloes are generally kept by Nepalese, and cost about Rs. 15 for a bull calf and Rs. 45 for a cow. The cattle are neither worked nor milked, and are in consequence sturdy little animals. In the front room of many Garo houses will be seen a fat well favoured beast, which is being kept to serve as the *piece de resistance* at the next funeral feast. Bullocks and cows usually cost about Rs. 20 each. Goats are used for food and sacrifice, pigs are of the ordinary black variety.

In 1904, there were 18 reserved forests in the Garo ^{Forests.} Hills, and they covered altogether an area of 139 square miles. The majority of these reserves are small patches of land, not more than one or two square miles in area, which bear sal (*shorea robusta*) or other valuable kinds

of timber trees. The receipts obtained from each reserved forest in 1900-01 and subsequent years will be found in Table VI. Further details with regard to the six reserves that are ten square miles or more in area are appended to this chapter.

The most valuable forests in the district are the sal forests along the northern border. There are patches of sal in the interior intermixed with other trees such as sam (*artocarpus chaplasha*), ajhar (*lagerstræmia flos reginæ*), poma (*cedrela toona*), paroli (*stereospermum chelonoides*), sida (*lagerstræmia parviflora*) and gomari (*gmelina arborea*), but a considerable portion of the hills has been cleared at one time or another for the shifting cultivation of the Garos, and land which has once been *jhumed* produces little but bamboo and low scrub jungle. In a subsequent chapter it will be shown that on the northern and western frontier of the district a belt of land, a large part of which is covered with forest and jungle, is owned by the Mechpara, Karaibari, and Bijni zamindars. Except in the case of what is known as the Mechpara B mahal, the forests on this land are managed by Government, who retain 25 per cent of the total collections. The Mechpara B mahal is managed by the zamindars, and Government only receives 15 per cent of the gross revenue.

Forest administration and trade.

The district is divided into four ranges with headquarters at Damra, Phulbari, Mahendraganj, and Baghmara. Forest produce is, as a rule, brought down the rivers, and there are accordingly four check stations; one

at Dekachang for the Krishnai river, one at Nibari for the Jinari river, one at Manikarchar for the Kalu river, and one at Dalu for the Bhugai river. Any person who pays house tax or land revenue in the district can remove any timber and other forest produce which he requires for his own use, free of charge. If he wishes to trade in small unreserved trees and unimportant minor forest products he takes out what is known as a *gurkati* permit, for which he pays one rupee. Foreigners pay three rupees for these *gurkati* permits. Sal, sam, and ajhar, and, in the Someswari valley, nahor and poma are the trees in which the biggest trade is done. They are cut up into *dhums*, or logs about seven or eight feet long, which are used for boat building, or into *gools*, or logs from fifteen to twenty feet in length. These logs are made up into rafts, which are attached to dug-out canoes, and floated down the rivers in August and September to depôts at Marnai, Dubapara, Nagarbera, Dalu, Ghoshgaon, and Baghmara, where they are purchased by traders from Bengal. There is also a considerable trade in canoes which are hollowed out of *titasapa* (*michelia champaca*), *koroi* (*albizzia procera*), *gomari* (*gmelina arborea*), jam and ajhar. Royalty is levied in the case of sal or sam at the rate of 6 annas a cubic foot, subject to a maximum of Rs. 10 per tree. For other reserved trees,* the rate is 4 annas a cubic foot subject to a maximum of Rs. 6.

The forest receipts and expenditure in 1900-01 and subsequent years will be found in Table VII. The receipts

* A list of reserved trees will be found on page 44 of the Assam Forest Manual.

from each of the reserves will be found in Table VI, and it will be seen that, as a rule, they contribute only a small portion of the revenue. In 1902-03, out of a total forest revenue of Rs. 81,000, only Rs. 6,000 were realized from the reserves. A royalty of Rs. 2 per maund is levied on all lac collected from unclassified state forests, and the receipts under this head often amount to a considerable sum. The Dambu reserve, which is situated on the border of the Khasi Hills, contains a fine growth of sal. On three occasions leases of this forest have been given on favourable terms to timber traders, but on each occasion the concession was resigned, as it was found impossible to work it at a profit. The receipts from the forests of the Garo Hills will probably increase as time goes on. The populous district of Mymensingh, lying immediately to the south, is largely dependent on the hills for its supply of timber, and the private forests in Goalpara have been reduced by overfelling. There are good waterways around the base of the hills, and the rivers are fit for the transport of timber for a distance of from ten to fifteen miles within the hills themselves.

Lac.

Most of the lac produced in the Garo Hills is reared on the arhar plant (*cajanus indicus*), which is grown for this purpose in the *jhums*, though the insects are sometimes placed on different varieties of the *ficus* in the jungle. As far as is known the quality of the product is not affected by the tree on which the insect has been fed. The method of propagation is as follows:—Pieces of stick lac containing living insects are placed in baskets and tied on to the twigs of the tree on which the next

crop is to be grown. After a few days the insects crawl on to the young branches and begin to feed and secrete the resin. They are left undisturbed for about six months and the twigs encrusted with the secretion are then picked off. Ants and the caterpillars of a small moth sometimes do much damage to the insect, and a heavy storm at the time when they are spreading over the tree will destroy them altogether. Cultivated lac is only reared in a narrow belt of country along the north of the district between Phulbari and the border of Kamrup. The Garos think that it would be unlucky to rear lac in any other portion of the district, though small quantities are occasionally collected from the jungle. The lac is exported in the crude form of stick lac. The principal centres of the industry are in the neighbourhood of Nibari and Damra.

The local industries are of no importance. The Garo **Industries.** women weave a coarse cotton cloth for the scanty garments of themselves and the men, and bamboo mats and baskets are also made for sale. Rude pottery is made in certain villages, but nearly all the metal utensils are imported.

There is no labouring class in the district, and conse- **Wages.** quently no market rate of wages, though the village headmen occasionally give advances to their poorer neighbours, and by this means induce them to come and work for them as servants. Labour is required for getting in the harvest, but this is provided by a system of mutual assistance, the villagers helping one another and receiving help in their turn. Porters and coolies working

on the roads receive four annas a day, but they cannot be obtained without the intervention of the local officers.

Prices.

Table VIII shows the price of common rice, salt, and matikalai at Tura in 1880, 1890, 1900, and subsequent years. The price of rice fluctuates considerably from year to year, but as each household generally grows enough for its own consumption, and no more, variations in the price have little effect upon the district as a whole. The price of salt has fallen considerably since 1903.

Food.

The staple food of the Garos is rice, but their dietary is much more varied than that of the people of the plains, and, in addition to rice, they grow in their *jhums* yams, beans, millet, maize, and chillies. They also eat the flesh of almost any animal, domesticated or wild, which they can get. Dog is esteemed a luxury. Milk, like other hill tribes, they eschew. This aversion of the inhabitants of Assam to milk is referred to by the historian of Mir Jumla's invasion in the seventeenth century, and the description given of these people then would apply to the Garos at the present day. "They eat whatever they get, and from whomsoever it be, following the bent of their uncivilized minds. They will accept food from Muhammadans and other people; they will eat every kind of flesh except human, whether of dead or killed animals. They taboo butter, so much so that they will refuse food if it only smells of butter."*

Dress.

The Garo costume is as scanty as is compatible with decency. The men wear a narrow cloth, which is passed between the legs and fastened round the waist, and which

* J. A. S. B. Vol. LXI., Part I, No. 1, page 80.

does not really effectually cover the part it is intended to conceal. The woman's cloth, which is only about fourteen inches broad, is fastened round the body below the navel, the two top corners meeting over the thigh; the bottom corners are left unfastened, as otherwise the petticoat would be too tight for comfort. The women load their ears with masses of brass earrings, and individuals have been seen with more than 60 brass rings, each $6\frac{1}{2}$ inches in circumference, and weighing altogether just under 2 lbs., in the lobe of a single ear. The lobe, though enormously distended, was not broken; but the weight of the rings was to a great extent supported by a string passed over the head. The weapons of the hill men consist of spear, sword, and shield. The sword, which is peculiar to these hills, is a two-edged instrument, the blade and handle forming one piece. The shield is composed of thin strips of bamboo woven together so as to be almost proof against a spear thrust; or sometimes of bear skin stretched on a bamboo frame. Garos wear turbans wound tightly round the top of the head so as to keep the hair erect. The actual crown of the head is, however, bare. The other inhabitants of the district wear the usual costume of the Assamese, i.e., a waist cloth and shawl, with occasionally a cotton coat for the men, and a petticoat and shawl for the women.

The Hindus and Muhammadans live in small huts ^{Dwellings.} surrounding a neat courtyard, which do not differ in any way from the houses of the plains. Bamboo is the staple article used in the construction of the ordinary Garo house. The front room is on a level with the

ground, but as the houses are often from 80 to 100 feet in length and are built on the side of a hill, a considerable portion of the structure has of necessity to be raised on posts. The interior is divided into several compartments, but light and ventilation are alike lacking. There are generally one or more verandahs at the side or end, and in front two wooden posts are erected in memory of each dead member of the family. Before some houses there will be seen a regular sheaf of thirty or forty posts, some of which are roughly carved into the effigy of the human form and dressed in the clothes of the deceased. The horns of all cattle killed are also kept in the front verandah, as an abiding testimony to the wealth and liberality of the family.

**Prosperity
of people.**

The Deputy Commissioner (Captain Playfair) is of opinion that, in comparison with the people of the plains, the Garos are extremely prosperous. Food of all kinds is readily obtainable, for their fields produce yams, beans, rice, maize, and chillies, and with such a miscellaneous crop it is very seldom that a complete failure of the harvest can occur. The people live in comfortable houses and feed well. Money is comparatively plentiful and high prices are paid for the Garo's greatest treasure, the *khora* or metal gong which they call *rang*. The intrinsic value of these articles must be very small, but old *khoras* often change hands at purely fancy prices. Bong Lashkar, for instance, realizing that with the advance of civilization the value of these articles was bound to fall, sold a collection of 60 for no less than Rs. 3,000; a large sum to realize from a community of semi-savages

for objects which are, after all, of no material value. Cotton, lac, and timber bring a considerable amount of money into the district, and the aversion which even the poorest of the Garos have to working for hire, indicates a complete absence of anything ordinarily known as poverty.

The following description of these *khoras* is taken from the Report on the general administration of the district in 1886-87 :—

The trade in these "khoras" is a curious one. They are used chiefly as gongs, beaten at all their feasts whether on occasions of joy or sorrow. The people dance and sing to their music, their accumulation is the aim of every Garo's life, and their possession is a badge of respectability and position. They are a standard token of exchange throughout the district, they are precious heirlooms handed down from generation to generation. What old china is to the art collector, an old "khora" or rang is to the Garo, as in numismatics so it is for them as regards khoras, "it is the rust they value, not the gold." These khoras are even now made in Goalpara and Mymensingh and are sold according to the weight of metal. Rs. 8 would be a good price for a modern one, but an old one, whose intrinsic value might have been when new Rs. 5, will exchange for sums up to Rs. 250. The fortunate possessors of these old khoras are well known, and could always get full exchange value for them. The marks and signs on khoras of different generations are recognized by large numbers of the skilled. It has, however, been a marvel to me that the artificial demand has not produced spurious articles in greater quantities. One well known Garo told me without shame, indeed with pride, and told me in the presence of many other Garos, that he had some few years ago got khoras made in Goalpara on the pattern of an old one he had, that these new ones cost him Rs. 6 each, that he buried them in the ground for some months with salt, and then took them out converted in appearance into khoras many generations old, so old as to deceive the best judges, and so valuable as to have brought him nearly Rs. 100 each.

Trade.

The principal articles of export from the hills are timber, chillies, lac, and cotton. From the last two staples the Garos derive considerable profit, but there is little trade except in these four commodities, and in mustard and jute which are grown for export in the plains mauzas. In bad seasons a certain quantity of rice is imported into the hills from the district of Mymensingh, but the Garos are not a people of numerous or varied wants and satisfy most of their requirements from the produce of their farms. Other articles of import are salt, dried fish, live stock, and the brass earrings which are so dear to the heart of the Garo belle. Most of the trade of the district is conducted at the various markets, a list of which will be found in the Appendix. The only places in which there are any permanent shops are Tura, Baghmara, Cheran, Dekachang, Phulbari, and Mahendraganj, and at none of these places except Tura are there more than three or four.

Communications.

Communications, as is only natural in a sparsely populated, jungle-covered, and hilly country, are not particularly good. Tura is generally visited from the Rohmari steamer ghat, which lies from 35 to 40 miles to the east of it in the district of Rangpur. In the winter time there is often a tedious and difficult march of five miles across sandy *churs* from the steamer ghat to the inspection bungalow. There is no receiving flat, no floating dak bungalow, nothing but a few grass huts, occupied by steamer clerks and coolies, in the middle of this sandy waste.

The steamers often arrive late at night, and as there are broad backwaters to be crossed before the main bank is reached, the traveller starts upon his journey under most unfavourable conditions. The position of the ghat shifts, moreover, from season to season, and it is difficult for the casual visiter to estimate the exact degree of inconvenience that he is likely to experience, but that it will be very considerable he may feel quite sure.

From Rohmari a cart road runs past Manikarchar to Tura, 35 miles away. There are inspection bungalows at the following places. The figure in brackets represents the length of the stage in miles :—Rangapani ($6\frac{1}{2}$), Garobadha (9), Damalgiri ($8\frac{1}{2}$), Tura (11). The road is unmetalled, but the gradients are very easy, and the total length can be considerably reduced by in places following a bridle path. Another cart road runs from Tura to Dalu on the southern frontier of the district. The total length is $33\frac{1}{2}$ miles, and there are inspection bungalows at Adugiri ($10\frac{1}{4}$ miles), Kirapara ($9\frac{1}{4}$ miles), and Barengapara or Dalu ($11\frac{1}{2}$ miles). There are two bridle paths from Tura, one to Phulbari and one to Bangshi, and thence on to Damra. The former is 38 miles in length, and has inspection bungalows at Sugiri ($11\frac{3}{4}$), Sampalgiri ($9\frac{1}{4}$), Rongmachakgiri ($9\frac{1}{2}$), and Phulbari ($7\frac{1}{2}$). The latter is $72\frac{1}{2}$ miles in length and has inspection bungalows at Duragiri (8), Arbela (6), Megapgiri (13), Rongrengiri ($8\frac{1}{2}$), Songsak ($10\frac{1}{2}$), Cheran ($10\frac{1}{2}$),

Bangshi (10) and Damra (7). There is also a cold weather track from Manikarchar to Bahadurkata hat, a total distance of 22 miles. There are inspection bungalows at Kalaichar ($8\frac{1}{2}$) and Mahendraganj ($10\frac{1}{2}$). Off the cart road the only means of baggage transport are elephants and porters. The Garos carry their loads on their back, supported in that position by a band round the head.

The following statement shows in a condensed form the extent to which the rivers are navigable in the rains. The dug-out canoe is the vessel ordinarily employed, and except to a partial degree on the Someswari and Krishnai the rivers are not navigable even by them in the cold weather :--

Name of river.	Point to which navigable.
Ajagar.	Abhirampara.
Bhugai.	Selbulgiri.
Dudhnai.	Dhepa hat.
Ghagoan.	Khanchonkona.
Jinari.	Bajengdoba.
Kalu.	Garobadha.
Kolonkini.	Rajabala.
Krishnai.	Dekachang hat.
Lokai.	Dhoromchash.

Name of river.	Point to which navigable.
Nitai.	Chakpatgiri hat.
Rongai.	Bangalkata.
Someswari.	Siju, and above the rapids as far as Rongrengiri.

There are no telegraph offices in the district and only one post office, which is situated at Tura.

Brief Description of reserves not less than 10 Sq. miles in area.

Name.	Situation and character of soil.	Area in square miles.	Date when constituted.	Names of valuable timber trees found in any considerable number in the forest.	Routes by which timber is or could be extracted and centres to which it would be taken.
Rongrengiri	Situated in mauza No. 5 in the centre of the hills. The reserve is a series of plateaux and small hillocks. The surface soil is good throughout. The under-lying rocks consist of gneiss and mica schists and quartzite rocks and dykes of trap, also sandstone strata containing several out-crops of lime and coal.	14	23rd June 1883.	Sal covers almost two-thirds of the area, in places densely, elsewhere thin and scattered. There are a few makai and paroli trees, but generally speaking there is no other timber but sal.	The only route by which timber from this reserve could be taken is down the Komswari river if the river can be cleared at a considerable cost, to Baghmara.
Songsak ...	Situated in mauza No. 4 in the midst of the hills about 10 miles south-east of the Rongrengiri reserve. The soil is rich though immense boulders of gneiss occupy a considerable portion.	14	3rd. October 1885.	Almost one-half of the reserve is occupied more or less densely by sal. There is little else but sal and scrub in the reserve, but among the latter there are a few paroli, gomari and makai trees.	Timber from this reserve can be extracted along the Rongri Nadi to Rongrengiri hat and thence by the Krishnai river to Marnai Depôt.
Chima-Bang-is.	Situated in mauza No. 4. The reserve comprises the first range of hills and the level	15	23rd June 1883,	The reserves contain a fair amount of sal in scattered and irregular	Timber can be taken to Marnai, Dubapara, Goalpara, Dhubri and Lower

	portion of the valleys on the west bank of the Dudhnai river. The rock is composed of gneiss and mica schists and quartzites. The level land in the valley consists of the wash from the adjoining hills.			blocks, but little other timber of any value. Sida, paroli, and karai trees are found in small numbers.	Bengal, by the Dudhnai and Brahmaputra rivers.
Jinari ...	Situated in mauza No. 3 close to the Goalpara boundary. There are two ranges of hills intersected by the valley of the Jinari, they consist of gneiss and quartzite rock. The valley is sandy loam.	10	23rd June 1883.	There is very little sal in this reserve, but a fair number of gomari, ajbar, paroli, poma and sida.	The Jinari and Brahmaputra rivers are the lines of export; by the former timber could be brought to Dubapara and Marnai and by the latter to Bengal.
Angratoli ...	Situated in mauza No. 1 on the border of the Mymensingh district. Comprises a range of low hills with a small area of plain land adjoining the Mymensingh district. The soil is rich.	17	28th January 1888.	Besides sal, which occupies nearly half of the reserve, karai is very abundant. Gomari and makai are also found.	Timber can be taken down the Buraghat river to the Mymensingh markets.
Baghmara...	Situated in mauza No. 1 on the Someswari river on the border of the Mymensingh district. The reserve is a series of hills and the soil, which is very shallow and poor, approaches clay in places. great boulders of sand-stone and conglomerate being exhibited on the surface.	19	26th February 1887.	There are narrow clumps of sal poles on the hills on the bank of Someswari. A few karai and rongi trees are found in this reserve.	The Someswari river which forms the western boundary of the reserve is navigable throughout the year, and timber can be floated by it to Baghmara and Mymensingh.

CHAPTER V.

GENERAL ADMINISTRATION.

Land revenue—Land settlement in the plains mauzas—Assessment in the hills—Revenue collections—Excise—Income tax and stamps—Public works—Government—Police and jails—Education—Medical.

**Land
Revenue.**

For revenue purposes the district is divided into two distinct areas, the hills mauzas, (mauzas I to IV), and a narrow strip of country consisting of lelland interspersed with low hills, on the northern, western, and southern frontiers of the district. This strip of country is nowhere more than six miles in breadth, and the average width probably does not exceed two miles. The form of revenue assessed in the hills is house tax, in the plains land tax, but before discussing the different tenures in force, reference must be made to the disputes that have arisen in connection with the boundary of the Garo Hills.

**Disputes
over
northern
boundary
of Garo
Hills.**

In the chapter on the history of the district it has been shown that the Bengali zamindars endeavoured to levy imposts on the hillmen and to bring them under their authority. Between 1849 and 1854 the southern boundary of the Goalpara district was laid down by the revenue survey under Mr. Kelso, and for some years this line was accepted as the northern boundary of the district of the Garo Hills. The zamindars of the estates along the frontier still at that time laid claim to the

right to levy tribute and cesses from the Garos. In 1869, Act XXII was passed to authorise the Lieutenant-Governor of Bengal to extinguish these rights on payment of compensation to the border landlords. With this object in view a boundary was laid down by Mr. Beckett, an officer duly authorised for the purpose, in 1873. Mr. Beckett, for reasons which are not quite clear, did not invariably follow Mr. Kelso's boundary. In places he carried his line considerably further north, and excluded from the district of Goalpara blocks of land, one or two of which covered an area of as much as six or seven square miles. Maps showing Beckett's and Kelso's boundaries will be found in R. A. Progs., June 1903, Nos. 53-114, and R. A. Progs., April 1902, Nos. 1-97.

The zamindars naturally objected to the summary extinction of the rights they had formerly exercised over the land lying north of Kelso's and south of Beckett's boundary, and instituted civil suits against the Government. On examination it was found that these cases could not equitably be defended, and compromises were concluded with the zamindars. The whole of the land claimed by the Ghurlla or Gauripur zamindar was resigned by him in perpetuity, in consideration of the receipt of an annuity of Rs. 7,164. The rights of the Mechpara zamindars south of Kelso's boundary were extinguished in consideration of the payment of Rs. 14,700. With regard to the land lying between Beckett's and Kelso's boundaries, the Mechpara zamindars were allowed to continue to be in

Compromise
with zamindars in
1873.

management of the B villages, *i.e.*, the villages situated in the plains which had all along been managed by them and treated by them as part of their permanently settled estates. They were, however, bound to collect "all rent and profits" only at the rates fixed by the Deputy Commissioner of the Garo Hills, and were required to pay Government 15 per cent of the gross collections, as some return on expenditure incurred by the state in keeping the peace on a frontier which had previously been in a very disturbed condition. In the A villages, the villages inhabited by Garos, the management and collection of the revenue was made over to the Garo Hills authorities, but 75 per cent of the gross receipts were handed to the zamindars. Terms similar to those laid down for the Mechpara A villages were accepted by the Bijni zamindar, an offer of a lump sum of Rs. 840 in extinction of all his rights and interests having been refused. The rights claimed by the Karaibari zamindars in land lying south of the Kelso boundary were extinguished on payment of an annuity of Rs. 4,975, and the management of the villages between Beckett's and Kelso's line was handed over to Government, on the usual terms that 75 per cent of the gross collections should be made over to the zamindars.*

On the conclusion of these agreements Regulation I of 1878 was passed which declared Beckett's line to be the legal boundary of the Garo Hills. All rights of the

* *Vide* letter No 2063, dated 9-11-1878 from the Secretary to the Chief Commissioner of Assam to the Secretary to the Government of India, Home Dept., File No. 63 J. of 1878, General Department.

zamindars within the Garo Hills were thus extinguished except to such extent as they were recognised by the agreements.

No attempt was made to survey or demarcate the land which had been transferred from the Habraghat pargana of the Bijni estate to the Garo Hills. It was known that Bijni were entitled to 75 per cent of the gross receipts from certain lands which had formed the subject matter of compromise in 1878, but no one seems to have known exactly where these lands were situated. There were no maps or boundary marks and the Deputy Commissioner appears to have assumed that what was really the Bijni A *mahal* was *khas* land at the disposal of Government. The revenue of a portion of the estate was entirely appropriated by Government from 1880-81 onwards, while in another portion half the revenue was credited to Government and half to certain Garo *lashkars* between 1880-81 and 1886-87. In 1887, the Deputy Commissioner came to the conclusion that the *lashkars* were not entitled to any portion of the revenue, and the whole of it was absorbed by Government. The managers of the Bijni estate were, however, dissatisfied with the small pittances which had from time to time been doled out to them. They pointed out that the profits of the land which had been excluded from the Habraghat pargana by Beckett's line, must have exceeded the trifling sums they had at long intervals received, and applied for a survey. Their request was granted in 1899. The survey disclosed that land which had for years been treated as

Bijni A
Mahal
wrongly
treated as
khas naza-
rana.

khas was in reality part of the Bijni A *mahal*, and in 1902, Government refunded to the Bijni estate Rs. 24,967 which appeared to be due on account of arrears of mesne profits.*

The nazarana land.

In addition to the land lying between Beckett's and Kelso's boundaries there are strips of level land lying between Kelso's line and the foot of the hills, which are known as the *nazarana mahals* and form part of the plains mauzas of the Garo Hills. These strips have never been surveyed, but they are said to be about twenty-five miles long and from one to five miles in breadth. The total area of these so-called *nazarana* lands between Beckett's and Kelso's boundary lines, which form the Bijni A *mahal*, is 37,500 *bighas*, and the settled area in 1900-01 was 2,600 *bighas*. The cultivated area in the *nazarana mahals* south of Kelso's line was 4,800 *bighas*. The population of this tract in 1901 was 5,370, seven-elevenths of whom were Garos. A report on these *nazarana* lands was submitted by the Deputy Commissioner on February 12th, 1903 (R. A. Progs., June 1903, Nos. 53-114.)

Claims of Garos to land.

Reference has already been made to the claims put forward by the Garos to land in the Habraghat pargana, and in 1903 the Bijni zamindar agreed to allow the Garos 25 per cent of the revenue realized from the Bijni A *mahal*, on consideration that they abandoned for ever all claim of any description to this land. In making this compromise it should be noted that the zamindar

* *Vide* No. $\frac{601}{3957}$ M J, dated 1st September 1902, from the Secretary to the Chief Commissioner to the Government of India.

declined to admit that the Garos had any rights whatsoever in these lands. The Garos accepted this compromise, but subsequently repudiated it, as, misled by an intriguer, they put forward claims, for which obviously there is no foundation, to the whole of the Habraghat pargana.*

In the Plains there are two permanently settled estates with whose management Government has no direct concern. One estate, which is known as Pirpal Baklai, is situated near Mahendraganj and covers an area of 428 acres. The other is the Mechpara B *mahal* to which reference has been already made. The remainder of the plains mauzas is managed directly by Government, though, in the areas which form part of the Goalpara zamindaries, the landlords receive 75 per cent of the collections. In 1903-04, the net cropped area of the plains mauzas, including Pirpal Baklai, was 82,000 bighas, rather more than half of which was included in the boundaries of the zamindars' estates, and the total land revenue Rs. 28,732, more than two-thirds of which was realized in the zamindari *mahals*. Land revenue is assessed at the following rates per *bigha* :—*basti* Re. 1 or As. 12, *rupit* As. 8 and As. 6, and *faringati* As. 6 and As. 4. First class land is known as *kaimi*, second class land as *char*. In the hills, town lands and two small sites on Tura peak are held on annual

Land settle-
ment in
plains
mauzas.

* The total revenue derived from the plains portions of the Garo Hills is not large, but the questions of boundary and title are a little obscure. The most important papers on the subject in the Assam Secretariat are File No. 63 J. of 1878. R. A. Progs., April 1902, Nos. 1-97; R. A. Progs., September 1902, Nos. 63-74; R. A. Progs., June 1903, Nos. 53-114; and R. A. Progs., March 1905, Nos. 90-124.

leases, and the Baptist Mission hold 84 *bighas* of land on a thirty years' lease in Tura station. Land in Tura station which is not occupied by Government servants for residential purposes is assessed at Rs. 2 per *bigha* with a minimum assessment of Re. 1, except in the bazar where the rates are Rs. 4 and Rs. 2 respectively. The rate assessed on land held on 30 years' lease is Re. 1 per *bigha*. The total current land revenue demand in the plains mauzas in 1903-04 was Rs. 37,500, out of which the zamindar's share amounted to Rs. 15,600. Plough cultivation on low land in the hills mauzas is also assessed to land revenue, but for purposes of administrative convenience such land is always amalgamated with the plains mauzas. *Jhum* cultivation on outlying hills in the plains mauzas is taxed at the rate of Rs. 2 per cultivating house.

**Assessment
in the hills.**

In the hills no attempt is made to measure up the actual area under cultivation, but a tax is levied of Rs. 2 per house, except in a few villages which are included in the zamindar estates. The incidence of this taxation is much lighter than the incidence of land revenue in the plains. The Garos are prosperous and the question of raising the house tax and of thus compelling them to contribute a little more towards the cost of the administration of the district is now under consideration.

**Garos rights
in land.**

In the hills, the *nokma* or headman of the village is, according to Garo customs, considered to have *jhum* rights over a certain tract of land. All members of the village are, however, allowed to cultivate rent free, and

even if a foreigner or Garo from another village settles on the land, he is only required to pay a purely nominal quit rent, such as four annas in cash or a present of fowls and liquor. The *nokma* thus, under Garo usage, reaps little or no benefit from such rights as he is considered to possess, and he does not appear to have ever occupied the position of an ordinary landlord.*

For the purposes of the assessment and collection of ^{Revenue collection.} the revenue the plains portion of the district is divided into four mauzas. The staff consists of four mauzadars and 12 mandals under a supervisor kanungo. In the hills house tax is collected by 55 lashkars and 5 sirdars, who are remunerated by a commission of 10 per cent on the collections. The current demand on account of house tax in 1903-04 was Rs. 43,000, out of which Rs. 3,400 was payable to the zamindars.

The revenue raised under the head of excise in the ^{Excise.} Garo Hills is insignificant. Details will be found in Table XII. There is one opium shop at Mahendraganj. Opium is only consumed by the people of the plains mauzas, many of whom satisfy their requirements from shops in Goalpara or Mymensingh, and even the shop at Mahendraganj obtains its supplies of opium from the Dhubri treasury. There are two ganja shops, one at Garobadha and one at Mahendraganj, and country spirit shops at Mahendraganj and Tura. Revenue is raised at these shops on the out-still system. The Garos

* This description of the Garo theories with regard to rights in land is taken from Deputy Commissioner's letter No. 142 R., dated 20-8-03. The subject is a complicated one and it would not be safe to accept the views therein set forth as correct, without further inquiry.

however prefer their home-made liquor, of which they drink large quantities. The system of manufacture is described in the monograph on the tribe.

**Income Tax
and stamps.**

Income Tax is assessed in the Garo Hills, but the total number of assessees in 1903-04 was only 26, 14 of whom paid on salaries drawn from Government or other sources. Assessable assets of the zamindars contribute the bulk of the remaining tax. Revenue is realized both from Judicial and non-Judicial stamps, but the total amount so obtained is insignificant and in 1903-04 was less than Rs. 2,000.

**Public
Works.**

An overseer of the Public Works Department is stationed in the district, who works under the supervision of the Executive Engineer stationed at Dhubri. Public buildings and the road from Tura to Manikarchar are under the Department. The maintenance of the other roads and bridle paths is under the direct control of the Deputy Commissioner, who entrusts the repair of fixed lengths of path to the villages in the neighbourhood, for which they are paid at a contract rate per mile.

Government.

There are no sub-divisions in the district and the usual staff posted at headquarters consists of the Deputy Commissioner, the District Superintendent of Police, who is also Commandant of the Military Police Battalion, and the Military Assistant Surgeon, both of whom exercise judicial powers during the absence of the Deputy Commissioner on tour. An Extra Assistant Conservator of Forests is also usually posted to the district. Special rules are in force for the administration of criminal and

civil justice.* The jurisdiction of the High Court is barred except over European British subjects in criminal cases, and the Chief Commissioner is the chief appellate authority. The Deputy Commissioner is empowered to pass sentences of death, transportation, and fine and imprisonment up to any amount, but the imprisonment must not exceed the maximum that could be awarded for the offence under the Indian Penal Code, and the fine is limited to the value of the offender's property. Death sentences, and sentences of seven year's imprisonment or transportation or more, require the confirmation of the Chief Commissioner.

Petty criminal cases may, under certain restrictions, be tried by the village authorities or *lashkars*, who may impose fines up to the amount of Rs. 50. Civil cases up to any amount may be tried by the *lashkars* under similar restrictions, provided that the parties are resident in their jurisdiction. Judicial work is not heavy and in 1902 only 184 persons were brought to trial in the district, excluding persons brought to trial before the *lashkars* but not convicted, for whom there are no returns. Fifty-five civil suits were disposed of in the same year, but only four were contested.

The Garos have developed the theory of the liability, to civil damages to a quite unusual degree. Every injury demands appropriate compensation or *dai*, and rather amusing instances are on record of the grounds on which claims for *dai* have from time to time been

* Vide Manual of Local Rules and Orders, p. 92.

based. On one occasion a Garo was assisting his host to stuff the mouths of his guests with a savoury mess of rice and chillies. Inadvertently he dropped some of the food, and in picking it up scraped up a little mud with it. One of the guests discovered that there was some alien substance in the food that he was eating, and brought claims for heavy compensation. Strange to say the claim was allowed by the village headman, but disallowed by the Deputy Commissioner, on appeal. On another occasion, a wild elephant smashed in the roof of a hut in which an old woman was sleeping, put its trunk in through the hole, and tore from her ear a bunch of earrings. She promptly laid a plaint against the elephant, since, as it was a tusker, she argued, and not unreasonably, that, if only it could be killed, she could recover compensation from the sale of its tusks. In another case A sued B for damages because B's brother had died of cholera, and A's brother had subsequently contracted the disease and died. Compensation for loss of life due to epidemics introduced from outside is, however, quite in accord with the views of the hillmen on the northern frontier of the Assam Valley. Cases which cannot be decided by direct evidence used often to form the subject of an ordeal. One simple form which is still employed is to place a pot of water on a tripod over a fire and to see whether it boils within a certain time. Another kind of ordeal demanded from the defendant considerable faith in the justice of his cause and in the alertness and reliability of his guardian gods. The accused person submitted to be tied up for several nights

alone in the jungle, and if he was not taken by a tiger it was assumed that his story was correct. The milder manners of the present day still recognize this test, but substitute a *murghi* for a man.

The civil police of the district in 1901 consisted of 66 head constables and men under a sub-inspector. There are outposts at Dalu, Garobadha, Mahendraganj, and Phulbari, each with a strength of seven men, and a road post of two men at Khuapara. The garrison of the district is, however, furnished by a military police battalion, which in 1903 had a strength of 4 native officers and 183 non-commissioned officers and men. In the cold weather one native officer with a non-commissioned officer and 31 men are deputed to hold two outposts on the northern frontier of Kamrup. The rest of the force is concentrated at headquarters. There is a small subsidiary jail at Tura which has accommodation for 20 male and 3 female convicts. Further particulars with regard to the jail will be found in Table XIV.

**Police and
Jails.**

Education in the Garo Hills is in the hands of the Baptist Mission, and such progress have they made that in 1903-04 15 per cent of the boys of school-going age were under instruction, a percentage more than double of that recorded in the Naga Hills and little inferior to that returned from Darrang and Lakhimpur. The proportion of girls at school was considerably higher than that returned from any district except the Khasi and Jaintia Hills. The total number of children at school in 1903-04 was nearly three times the number in the

Education.

Naga Hills, but even as long ago as 1874-75, when we had been only a few years in occupation of the hills, there were 457 children at school. There are no secondary schools in the district, but in 1902-03 there were 3 upper primary and 86 lower primary schools. There is also a special school at Tura in which Garos are trained to serve as teachers. The missionaries have translated a number of primers into the Garo language so that children are instructed in their own tongue, which is printed in the Roman character.

Medical.

The district has always been considered to be most malarious and unhealthy, and for many years it was thought that it would be quite impossible for Europeans to live amongst these low and densely wooded hills. In spite of this, there was a substantial increase in the population between 1891 and 1901, and it is probable that the Bodo tribes themselves have become, to some extent at any rate, immune to malarial poisoning. Malaria fevers of severe remittent and intermittent type are, however, common in every portion of the district, from June to October being the most unhealthy season of the year. In the early days of our occupation the district suffered from that acute form of malarial fever known as *kala-azar*, whose symptoms are described at length in the Gazetteer of the Nowgong District. The attention of the authorities was attracted to this disease as far back as 1869,* and it is said to have been the cause of serious mortality amongst the Garos, especially in the villages in the low hills on the northern frontier of the

* *Vide* Appendix A to the Sanitary Report of the Province of Assam in 1882.

district. The disease gradually burnt itself out, and in the eighties ceased to be of much importance. Cases of *kala-azar* still, however, occur amongst the villager on the hills near the Darang river.

The Garos are fully alive to the advantages of vaccination and during the five years ending with 1902-03 no less than 108 per mille of the population were successfully vaccinated, a ratio nearly three times as high as that reported for the Province as a whole. Small pox is in consequence by no means common. Cholera is not endemic in the hills but sporadic cases not unfrequently occur. The custom of eating decomposed meat and fish not unfrequently gives rise to outbreaks of ptomaine poisoning, with symptoms closely resembling those of cholera. Leprosy is also said to be unusually common.

There are four dispensaries in the district, two at Tura, one of which is a private dispensary managed by the missionaries, and one a Government Hospital with accommodation for in-patients, one at Dalu, and one at Mahendraganj. Ulcers and skin diseases are the complaints most generally treated at these dispensaries, but there are a large number of cases of malarial fever, and of diseases of the eye and of the respiratory system. Further details with regard to these dispensaries will be found in Tables XVII and XVIII. Venereal diseases are apparently not common. When left to themselves the Garos treat most ailments by prayer and sacrifice, though they apply the juice of a plant, which has a corrosive effect, to malignant sores.

TABLE
Reserved

Name of Reserve.	Area in square miles.	Character of Forests.
Dhima	9	The quantity of sal is very disproportionate to the area and fairly thick at the south-east bend of the reserve. Lower portions of the hills are covered with Tarai bamboos.
Dilma	2	The reserve contains a good deal of sal with inferior mixed forest, occasional Sida, Koroi and other good trees are met with but bamboos cover a very large area.
Raja Simla	7	The forest consists almost wholly of sal mixed with bamboos, a few Sida, Koroi and Gomari trees being occasionally met with.
Ildek	2	Sal occupies the interior valleys and slopes and the hills facing Ildek. It is mixed with bamboos and probably does not occupy more than half the area. Koroi, Sida and Gomari very much mixed with bamboos are found in the lower portions.
Dambu	8	Sal occurs in patches both pure and mixed. Pure sal occupies the valley. Tarai bamboos mixed with scrub jungle are found in the deserted <i>jhums</i> .
Darugiri	4	Exceedingly well stocked with sal which covers the whole of the flat land in the centre. Hills on the north and in the north-east are covered with sal mixed with bamboo and lower hill forests.
Chima-Bangsi	15	Both hilly and level lands. There are scattered clumps of sal but very little other timber of any value. Sida, Paroli and Koroi are found here and there.
Rongrengiri	14	This is a series of plateaux and small hillocks two-thirds covered with sal.
Songrak	14	Hills. About half the forest is covered with sal.

TABLE
Reserved

Name of Reserve.	Area in square miles.	Character of Forests.
Biju	2	Sal occupies the south-east corner of reserve. The northern half of the reserve contains some fairly good mixed forest, but the remainder is mere scrub. The prominent trees are Sida, Makra, Gomari and Akshi.
Rewak	2	Sal occupies about $\frac{1}{4}$ th of the reserve to the north-west. The triangular bit of low land along the bank of Someswari contains scrub, mixed with coarse grass and bamboos. In the rest of the mixed forest there are a few Sida and Makra trees.
Imangiri	3	Sal is in one compact block occupying the south-west of the reserve. Three-fourths of the area is covered with mixed forest containing Koroi, Sida, Makra, Paroli, Sam, Nahor and Ajhar.
Baghmara	19	Hills. There are narrow clumps of sal poles on the bank of the Someswari. A few Koroi and Rangi trees are also found.
Angratoli	17	A range of low hills with a small area of plain. About one half covered with sal. Koroi is abundant. Gomari and Makra are also found.
Dibru Hill	9	Patches of young sal occur here and there. The land to the west is very broken and sal plants are coming up on the top of the <i>tillas</i> . Towards the southern extremity, the forest is composed of more or less inferior evergreen trees and scrubs.
Bolsalgiri	1	There are 3 or 4 tiny patches of sal but most of the forest consists of bamboos and scrub.
Tura	1	Sal is scattered along the full length of the reserve. A few Gomari trees and Poma and Koroi are also met with.
Jinari	10	Plains. Little sal but a considerable quantity of Gomari, Ajhar, Paroli, Poma and Sida.

CHAPTER I. PHYSICAL ASPECTS.

Physical aspects—Plains—Rivers—Geology—Climate and rainfall —
Botany—Fauna.

The district of the Lushai Hills is situated between $22^{\circ} 20'$ and $24^{\circ} 27'$ N. and $92^{\circ} 20'$ and $93^{\circ} 29'$ E and covers an area of 7,227 square miles. It is bounded on the north by the districts of Sylhet and Cachar and the Native State of Manipur ; on the east and south by the Chin Hills ; on the south by Arakan ; and on the west by the Chittagong Hill Tracts and the Native State of Hill Tippera.

The whole of the district consists of ranges of hills running in a north and south direction, separated from one another by narrow valleys. The general height of these ranges is about 3,000 feet, though here and there, there are peaks over 6,000 feet in height, and the Blue Mountain in the South Lushai Hills rises to a height of 7,100 feet. The general elevation of the district rises towards the east, and in the Chin Hills there are several summits over 8,000 feet above the level of the sea. The sides of the hills are covered with dense forest or bamboo jungle, except in those places where they have been cleared for cultivation, and a stream or river is invariably to be found in the narrow valleys at their feet. The scenery of the district is thus described by Captain Shakespear, who served amongst the Lushais for many years.*

* *Vide Journal of the Society of Arts No. 2201, Vol. XLIII, January 1895.*

"From the summit of the Lungleh hill a grand view of the country is obtained. Turn to the west, and you look down over 2,000 feet on to a confused mass of hills and valleys stretching away to the horizon. It is a wonderful sight, these miles upon miles of tree-tops. Look which way you will, little but forest is to be seen. Here and there a cliff shows out white amidst the green, patches of bright yellow show where crops of rice are ripening, and here and there a hill-top is crowned by a little brown patch, denoting a village. For some twenty miles westward of Lungleh the country is practically uninhabited, and is the great hunting ground of the Lushais.

• • • •

"It would, I imagine, be difficult to find jungle more dense than that in the valleys between Demagiri and Lungleh—huge trees, with great buttressed trunks, raise their straight white stems to the leafy roof; creepers of all sizes wind round these massive columns, hanging in festoons from one to the other, or trail along the ground, twisted and knotted together. Ferns grow in profusion on all sides, on the rocks beside the streams, clinging to the trunks of the forest kings, and swinging in mid-air on the giant creepers. The branches of the trees are so covered with orchids that the bark is barely visible, while beneath is a tangled mass of vegetation, thorny canes and shrubs being twined together in such confusion that it is only by dint of much cutting and clearing that a passage can be made through it. The pace at which this jungle grows, during the rains, is almost incredible. In spite of two clearings yearly, the Government road is at times almost impassable. The bamboo jungle is monotonous to travel through, as the bamboos do not grow in clusters, but each stem by itself, and among the straight green stems there is no undergrowth to relieve the eye."

Plains.

Here and there, amidst this jungle-covered waste of hills and narrow valleys, there are plains, which are believed to have formed in the beds of silted up lakes. They have as a rule an elevation of about 4,500 feet and are covered with a thick layer of rich alluvial soil. They are surrounded by hills which slope gently towards the plain, but are generally very steep, often precipitous, on the outer side. Through the centre runs a sluggish

stream which escapes through a narrow gorge, below which is generally a fall of some height. The largest of these plains is Champhai, which has a length of about seven miles, and, at the widest part, is nearly three miles across. A few miles north of Fort Tregear there is a plain at Vanlaiphai, about six miles long and from a quarter to half a mile in width. The slopes of the valley are, moreover, gentle and undulating, and thus give the plain the effect of being wider than it really is.

The most important rivers are the Tlong or Dhales-**Rivers.** wari, the Sonai, and the Tuivol which drain the northern portion of the country and eventually fall into the Barak. The southern hills are drained by the Koladyne on the east, with its tributaries the Mat, Tuichang, Tiao and Tuipui; while the Karnaphuli, at the mouth of which stands Chittagong, with its tributaries the Tuichong, Kao, Deh, Phairang and Tuilianpui form the western drainage system. The drainage levels of the country are unusually complicated. The Tlong for some 40 miles of its length runs due northwards, while parallel to it to the east the Mat and to the west the Deh run due south. In the same way the Tuivol and the Tuichang and the Tuilianpui and Gudur run parallel to one another for many miles, but in opposite directions. The Tuichong and Phairang run north till they join the Deh, which then takes a westerly turn and delivers their combined waters into the Karnaphuli which flows south-west.

The hills consist of sandstones and slabs of tertiary **Geology.** age, thrown into long folds, the axes of which run in a

nearly north and south direction. The rocks are a continuation southwards of those forming the Patkai range, and were probably laid down in the delta or estuary of a large river issuing from the Himalayas in the tertiary period. Marine fossils of that time have been found near Lungleh embedded in nodular dark grey sandstone.

**Climate and
rainfall.**

The valleys are feverish and unhealthy, and during the rains the climate, even on the lower hills, is moist and enervating. In the higher ridges it is fairly cool and pleasant even at the hottest seasons of the year. In March and April violent storms from the north-west sweep over the hills. The average rainfall at Aijal is 80 inches in the year; at Lungleh some distance to the south it is no less than 131 inches. The average rainfall in each month will be found in Table I. Owing to the steepness of the hillsides and the narrowness of the valleys the rivers rise after heavy rain with wonderful rapidity. During the last four days of May 1889 over 27 inches of rain fell in the South Lushai Hills, and the level of the Karnaphuli river rose over 50 feet.

Botany.

The following account of the botany of the district has been received from the Director of the Botanical Survey of India. The Lushai Hills are clad for the most part with dense evergreen forest and bamboo. The most conspicuous and one of the commonest trees is *dipterocarpus turbinatus* distinguished by its huge size and immense buttresses. Other very common trees

are *saurauja punduana*, *schima wallichii*, *duabanga sonneratioides*. Figs are common, and at high elevations *quercus* and *castanopsis* abound. Palms such as *pinango*, *caryota*, *licuala* and *calamus* are frequent on the lower slopes. The undergrowth consists of such species as *clematis grewiaeflora*, *abutilon polyandrum*, *hibiscus*, *triumfetta*, *crotalaria*, *flemingia*, *rubus*, *combretum*, *mussaenda*, *ixora*, *ardisia*, *jasminum*, *phlogacanthus*, *clerodendron*, *girardinia*.

Sutamineous plants of the genera *curcuma*, *amomum* and *alpinia* are quite common. Epiphytic plants are well represented by the abundance of orchids belonging to such genera as *dendrobium*, *bulbophyllum*, *eria*, *pholidota*, *cymbidium*, *aerides*, *vanda*, &c. Species of *raphidophora* are also very common. The herbaceous vegetation is not prominent consisting chiefly of such widely spread plants as *ageratum conyzoides*, *conyza stricta*, species of *blumea*, *gnaphalium*, *desmodium*, *begonia*, *hedyotis*, *heliotropium*, *mazus*, *toveria*, *rungia*, *plantago*, *amarantus*, *polygonum*, &c. Ferns are common belonging to such genera as *pteris*, *asplenium*, *nephrodium*, *polypodium*, *onychium*, *lygodium*, *angiopteris*

Wild animals are numerous in the more sparsely **Fauna.** populated portions of the district and include elephants, the two horned rhinoceros, bison, tigers, leopards, bears, and various kinds of deer. Bears are of two varieties, the Himalayan black bear (*ursus torquatus*) and the Malay bear (*ursus malayanus*) and are unusually

common. In 1904 rewards were paid for the destruction of 249 of these animals, or very nearly half the total number of bears killed in the Province of Assam. Wild dogs also are common and frequently kill off young stock. The serow (*nemorhædus*) is found on the higher hills. Small game include jungle fowl (*gallus ferrugineus*) and several kinds of pheasants.

CHAPTER II. HISTORY.

Summary of raids—Raids on the south—Troubles in 1888—Further raids and expedition of 1889-90—Rising in 1890—Punitive measures—Outbreak in 1892—Promenade in 1892-93—Policy on the north-east frontier.

The history of our relations with the Lushai and Kuki tribes down to the end of the year 1883 will be found in the North-East Frontier of Bengal by Mr. (afterwards Sir Alexander) Mackenzie, pages 287 to 365 and need not be recapitulated here. Briefly, it is a history of their raids into British territory, and of our efforts to put a stop to this perpetual annoyance by punitive expeditions, by the locating of outposts along the frontier, and by diplomatic efforts. None of these measures were, however, productive of anything more than purely temporary results, and the tribes were never pacified till we had established a strong force in the centre of the hills.

Before referring to the events of 1888 and later years, ^{Summary} it is desirable to summarize the various raids and ^{raids.} expeditions which are described at length in Mackenzie's North-East Frontier. The following were the most serious inroads into the Province of Assam. In 1844, Lal Chokla raided Sylhet and took 20 heads and was subsequently arrested by Captain Blackwood who led an expedition into the hills. In 1847, upwards of 150 persons were killed by Kukis, but it was subsequently

discovered that the massacre took place in Hill Tippera and not in British territory. In 1849, there were further raids into Sylhet and Cachar, and in 1850 Colonel Lister led an expedition into the hills, burnt one village and retired. In 1862, and again in 1868, there were further raids. In 1869, two columns of troops were sent into the hills under General Nuthall, but owing to the inclemency of the weather failed either to rescue the captives or to punish the offenders.

In 1871, there was an outbreak all along the frontier, and raiding parties entered Cachar, Sylhet, Manipur and Hill Tippera. In Cachar several tea gardens were attacked and at one of them, Alexandrapur, a planter, Mr. Winchester, was killed. In 1871-72, a strong force was sent into the hills divided into two columns which advanced from Chittagong and from Cachar. The Cachar column burnt Champhai, the principal village of the chief Lalbura, and the Chittagong column was equally successful. The effects of this expedition were felt for many years, and it was not till 1888, that the Lushais once more began to be a source of trouble.

**Raids on the
south.**

Prior to 1860, there were numerous raids upon the Chittagong frontier, but that year is famous for what is known as the great Kuki invasion. These savages burst into the plains of Tippera near Chagulneyah, burnt or plundered 15 villages, killed 185 British subjects, and withdrew again with 100 captives into their jungly fastnesses. A small expedition was sent into the hills, but it produced little practical effect, and raids, though not

on such an extensive scale, continued to be made. Peace for sixteen years was, however, obtained by the expedition of 1871-72.

In 1888, it was thought that the tribes had quietly settled down, and three British officers, Lieutenants Stewart, Baird, and Shakespear were deputed to survey the frontier on the south. Lieutenant Stewart, with two soldiers of the Leinster Regiment and a small guard of military police, was working on the Belaisuri range about twenty miles from Rangamati. He appears to have had no thought of danger, declined to post a sentry over the camp at night, and for one cause or another, reduced his guard till he was left with only the two European soldiers, a naik and five sepoy. Early one morning, he was surprised by a party of Pois headed by Hausata Dokhola, and Vantura, who found their victims completely unprepared. The European soldiers were still in bed and were killed where they lay, but Lieutenant Stewart and two sepoy were able to open fire upon their assailants. A shot through the breast soon laid that unfortunate officer low, and the two sepoy retired, taking with them two of their number who were at a little distance from the camp when the attack took place. Another sepoy was severely wounded at the first volley and subsequently killed. The cause of the raid was a dispute between husband and wife. Hausata had married a daughter of Zahuta, but he ill-treated her and she fled to her father for protection. The latter agreed to return her to her husband but for a price, the price in question being the heads of two persons who were not

Trouble in
1888.

Kukis or Lushais. It was to obtain these heads that Hausata sallied out upon the war-path. It was impossible at that time to make suitable reprisals, and in December 1888 two chiefs Lungliana and Nikama attacked a village which was only four miles distant from Demagiri, and killed and carried off the bulk of the inhabitants. Lieutenant Widdicombe, who was in command at Demagiri, at once hastened to the village, but the raiders had already left, and, as he had no provisions with him, he was unable to go further in pursuit. Punishment was, however, only for a time delayed, and in January 1889 a force, consisting of 57 British commissioned and non-commissioned officers and 1,225 men with two guns, under Colonel Tregear, was sent into the hills. The Lushais offered no opposition to this formidable host, and though Hausata's village was burnt, little damage, apart from this, was done. There was no fighting and there were only 29 deaths in a force, including followers and coolies, of nearly 4,000 souls. But the results obtained were very slight in comparison with the heavy expenditure entailed, and two British officers succumbed to the unhealthy climate of the hills.*

**Further
raids and
expedition
of 1889-90.**

This demonstration of military activity had little effect upon the Lushais, and, at the very time when the expedition was in the hills, Lianphunga, a son of Sukpilal, despatched a raiding party which devastated the Chengri valley on the Chittagong frontier.† Thirty-seven

* *Vide* Report on the Lushai expedition of 1888-1889.

† It should, however, be added that the raid took place when the troops were only assembling at Demagiri.

persons were killed by the marauders and 75 were carried off as captives. To avenge this raid troops were sent into the hills, both from the north and south, in the cold weather of 1889-90. General Tregear was in command of the column operating from Chittagong, which had a total strength of 53 British officers and 3,294 of native rank and file. From the north, Mr. Daly advanced with a force of 247 military police of all ranks, and joined hands with Colonel Skinner who had been despatched with a strong body of troops from the southern column. Mr. Daly reached Changsil towards the end of January, and there received the great majority of the persons who had been taken captive in the raid into the Chengri valley. He then proceeded to Lianphunga's village which was situated to the south of Aijal. Lianphunga came in to meet him and stated that he had raided in the Chengri valley because the inhabitants had settled in their best hunting ground and declined to move, and that he was under the impression that they were the subjects of Hill Tippera and not of the British Government. Mr. Daly did not arrest the chief but persuaded him to promise that he would surrender to Colonel Skinner on his arrival, on the understanding that he should neither be transported nor hung. Unfortunately Lianphunga learned that there were eight Sahibs with Colonel Skinner's column, and thinking that eight Sahibs could over-rule the four with Mr. Daly, and that they might possibly repudiate the agreement made with him, he began to repent him of his promise. On the arrival of Colonel Skinner a day before he was expected.

Lianphunga absconded, and when the village was occupied by the troops, it was fired by the Lushais. A few skirmishes occurred during the next three weeks, but our total loss was only one man killed and one officer and two men wounded, while the Lushais admitted to having lost four men. The resistance offered by the enemy was in fact of the feeblest, but, as it had been clearly shown that expeditions which entered the hills and withdrew again had little permanent effect, it was determined to build a stockade at Aijal, to be held during the rains. While the work was in progress there was a large gathering at Thanruma's village a little to the north. But, though the Lushais lay across the line of communication, so anxious were we to avoid unnecessary hostilities, that they were allowed to disperse without being attacked.

While these events were taking place a column was detached which burnt the villages of the two chiefs Lungliana and Nikama, who had raided the village near Demagiri. Vantura, one of the leaders of the raiding party that had killed Lieutenant Stewart, was captured by a reconnoitring party, but succeeded in making his escape, and he did not make his final submission till the end of 1890. A stockade was erected at Fort Tregear and was garrisoned with 200 rifles of the 2/2nd Gurkhas, while at Lungleh there were 140 rifles of the military police. Garrisons of military police were also left at Aijal and Changsil, and, in May 1890, Captain Browne, who had been appointed Political Officer of the North Lushai Hills, took up his quarters at the former place. The

control of the South Lushai Hills was at the same time entrusted to Captain Shakespear.

One of the first duties imposed on Captain Browne was to mete out suitable punishment to Lianphunga, and in June 1890 he held a durbar at Aijal for the purpose. He passed an order deposing this chief for four years, but subsequent events made it impossible to enforce this sentence. The questions of the payment of house-tax and the supply of labour were referred to, but, as the chiefs regarded these proposals with disfavour, the matter was allowed to drop. The Lushais were, however, by no means satisfied, and the western chiefs entered into a conspiracy to attack the stockades at Changsil and Aijal and kill the Political Officer. The rising took place on September 9th, 1890, when attacks were simultaneously made on both stockades, and Captain Browne, who was marching down the road with a small escort was ambuscaded about two miles from Changsil. He was wounded in three places in the arm, but managed to struggle on to the stockade, where he died from exhaustion due to loss of blood, a quarter of an hour after he had reached a place of safety.

Rising in
1890.

The following description of the outbreak is taken from a letter by Lieutenant Cole who was in command of the stockade at Changsil.*

Beginning of
outbreak.

"Nothing eventful then happened until the morning of the 9th, when the men, to the number of about 120, were engaged at work on the new stockade. About 50 of them had brought up their rifles,

* No. I C. H., dated Changsil, the 12th September 1890. P and J—A, For. Progs., October 1890, Nos. 1—135.

which were piled in the centre of the stockade. Work was proceeding as usual, when suddenly a single shot was heard in the direction of the old stockade. This shot did not attract much notice, as it was thought it was probably fired by some of our men at game. However, one of the Jemadars went down to find out, and soon returned, saying the Lushais had come and surrounded the lower stockade. I then fell in the men at once round the palisading of the stockade. We were soon attacked, and we could have held the stockade for as long as we liked. However, as I heard very heavy firing and the bugler constantly blowing the alarm from the lower stockade, as the majority of the men with me were without arms, and as all our rations and ammunition were in the lower stockade, with only 30 fit men left to protect it, while it requires a garrison of at least 100, I had to leave it after about half an hour. I should have done so at once had it not been that I hoped by holding the upper stockade I should give Captain Browne, whom I expected, a better chance of arriving, but, as nearly all the Lushais must have come from the same direction as he was coming, I had little hopes of his arriving in safety. I then went down to the lower stockade at about 10 A.M., and the Lushais kept up a constant fire for some two hours afterwards.

"I was arranging to make a sortie when Captain Browne arrived about half an hour afterwards, a mass of blood and evidently badly wounded. He was at once attended to, and the bleeding stopped, but he had lost nearly every drop of blood in his body, and never recovered consciousness until he died, about fifteen minutes after his arrival, from collapse.

"From what I can gather, the Lushais who came to attack us split themselves up into three parties, one of which went down to attack the bazar, which they looted after killing five out of the nine shop-keepers, and two boatmen. They also took their heads. The other party endeavoured to force an entrance at the lower end of the present stockade, and the third to do so at the upper end. They no doubt thought they would have good chances of success as nearly all the men were out on work, and they were all acquainted with our habits from constantly passing by the stockade while going to and from the bazar. Some of this latter party came up to the upper stockade to attack, when they were checked at the lower stockade."

Defence of
the stock-
ades.

News of the outbreak was at once despatched down the Dhaleswari by Lieutenant Cole. Repeated attacks

were made upon both stockades, but that officer never expressed any doubt as to the capacity of the garrisons to hold out till reinforced, though with the small force at his disposal it was impossible to attack the villages of the revolting chiefs. In reporting on the outbreak to the Government of India, the Chief Commissioner, Mr. Quinton, who, a few months later, was himself to fall a victim to the uncertain temper of the tribes upon the North-East Frontier, stated that, in his opinion, "Lieutenant Cole on this sudden emergency exhibited great coolness and sound judgment, to which it is probably mainly owing that the garrison was not surprised and cut off." Up to this date the Lushais had succeeded in killing Captain Browne, his clerk, seven coolies, five traders, two boatmen, one police sepoy, and one follower.

Two hundred men of the military police were at once pushed up from Cachar under Lieutenant Swinton. In their passage up the Dhaleswari they met with considerable opposition. Flanking parties had been sent along the river banks, but near Lenkhunga's *jhums* they had been recalled to assist in hauling the boats over some strong rapids. The Lushais seized this opportunity to open fire. Lieutenant Swinton was seated in the front of his boat, his orderly standing by him. A bullet struck the orderly on the forehead, but glanced off and buried itself in the officer's stomach, inflicting a wound which very soon proved fatal. The troops were taken on to Changsil by Lieutenant Týtler, and two hundred more sepoys arrived at that place on September 30th. On

Death of
Lieutenant
Swinton.

October 4th Thanruma, which lay between Changsil and Aijal, was attacked and destroyed, and Aijal itself relieved.

**Punitive
measures.**

Mr. McCabe was then appointed Political Officer of the Lushai Hills, and no time was lost in punishing the offending chiefs. The villages of Hrangkupa, Lalhrima, Hmingthanga, Lalsavuta and Thanruma were captured and destroyed without much difficulty. A move was then made against the village of Khalkam, the most influential of the western Lushai chiefs. The village was attacked from two sides, and captured without loss to the attacking party, though ten of the Lushais were killed. During the next few days the hamlets in the neighbourhood and the crops were destroyed, whereupon Khalkam, considering further resistance hopeless, came in. The whole of the western Lushais then submitted, and Khalkam, Lianphunga, and Thangula, who were the heads of the conspiracy, were all deported.* Fines of one hundred and eighty-four guns in all were imposed, and a considerable amount of punishment labour was exacted. The Political Officer then carried out a successful promenade through the country of the eastern Lushais. There was no opposition, and in the course of this tour he went as far south as the village of Kairuma. On April 1st, 1891, the South Lushai Hills, which had been controlled by an Assistant Political Officer under the Commissioner of Chittagong, were formed into a district and placed under the control of a Superintendent.

* Khalkam and Lianphunga hanged themselves in the Hazaribagh jail in September 1891. Thangula was released in 1896.

The Lushais at this time appeared to be quietly settling down under our rule. The villages which had been destroyed were gradually rebuilt, and house-tax was even paid, though with some demur. In January 1892, Mr. McCabe met Captain Shakespear and the other officers of Lungleh at Kairuma's village and proclaimed to the assembled chiefs at a durbar the unity of the Government policy in the hills. This was no unnecessary precaution as the hillmen were inclined to regard the officers of South and North Lushai as the representatives of two separate and distinct authorities. Outbreak in 1892.

In the following month Mr. McCabe proceeded to Lalbura's village with an escort of one hundred sepoy of the military police to enforce a demand for coolies which had been quietly but steadily ignored. The village was entered on February 29th without resistance, but the chief failed to appear before the Political Officer. On the following day, as paddy was being collected, 300 Lushais armed with guns were seen approaching. A volley was fired at them, which drove them back into the jungle, but this was only the signal for an attack delivered from every side. The village was fired by the Lushais and Mr. McCabe was compelled to retire to the crest of the hill on which it stood. Attacks were made upon this position in the evening but were repulsed without much difficulty, and on the following day the troops, who had by this time been reinforced from Aijal, occupied another hill and erected a stockade. Repeated attacks were made on this position, and on parties sent out to destroy grain and other property until the 10th April,

when a reinforcement of 300 men of the 18th Bengal Infantry arrived at Fort Aijal from Silchar, and an advance was made from Lalbura against Poiboi's village. This village was taken after some fighting on the 18th April. From that day until the end of May parties of police and military were continually employed in scouring the country, attacking the implicated villages, and destroying all stores of grain and other property that they could find. The villages of Lalruiya, Lalhleia, Bungteya and Maite were successfully captured and destroyed. With the destruction of the last-named village the campaign against the eastern Lushais came to a close and the expeditionary force returned to Aijal on the 8th June 1892, leaving a detachment of one hundred men in occupation of Lalbura's village. This chief did not finally submit till 1896 when he was allowed to found a village on payment of a heavy fine.

Captain Shakespear, on learning of the attack on Mr. McCabe, at once started to his relief, but the Howlongs rose to oppose his advance, and, as he had only an inadequate force at his disposal, he found himself unable to advance beyond the village of Vansanga until relieved by a column from Burma under Mr. Carey and Captain Rose. On their arrival the villages of Lalhrima, Lalkanglova, Tlongbuta, and Rochungnunga were destroyed.

An incident of the Eastern Lushais' rising, which deserves notice as showing the ease with which small parties of Lushais or other hillmen can attack any exposed portion of our extended frontier, was the raid of

a small party of Eastern Lushais on the Barunchara tea estate in the Hailakandi subdivision of the Cachar district. This raid, in which 42 coolies were killed, was made on the 4th April 1892, and was undoubtedly undertaken in the hope of inducing the Political Officer to abandon the advanced post at Lalbura.

During the cold weather of 1892-93, a column of military and military police under Mr. Davis, who had assumed charge of the North Lushai Hills, co-operated from Fort Aijal with a column operating from Lungleh under Captain Shakespear, to complete the punishment of the Howlong villages concerned in the outbreak of the previous cold season. Serious opposition to the advance of these two columns was expected on the Bengal side, but it became evident, some considerable time before the columns were ready to march, that any resistance was unlikely, and, as a matter of fact, none was offered. Mr. Davis subsequently visited the villages of the Kairuma group with an escort of 150 police and military, and at Kairuma's village, met Captain Shakespear who had with him an escort of similar strength.

On the conclusion of this expedition the district settled down, but for some time longer the chiefs of the Kairuma group of villages were inclined to dispute the authority of the Sirkar. Rice was supplied without demur for the use of the Shership outpost, and coolies for the carriage of the Political Officer's baggage when he visited the village, but the chiefs themselves declined to meet the Political Officer and coolies were not provided

Promenade
in 1892-93.

Kairuma
still gives
trouble.

for work on the Aijal road. Kairuma was accordingly fined 60 guns, and, as he still declined to make his submission, his village was visited in December 1895, by the Political Officer from Aijal with an escort of 300 rifles. Smaller columns co-operated from Falam and Lungleh, and thus demonstrated our ability to attack those who disputed our authority from every side. The chiefs still proved recalcitrant, and Kairuma's village was wholly, and the village of Jaduna, a Fanai chief who had disobeyed orders from Lungleh, was partially destroyed. A military police outpost was also established at Kairuma's village of Tlaikuong. In April 1898, the South Lushai Hills were transferred to the Assam Administration, and the district assumed its present form. Further information with regard to the history of the Lushai Hills will be found in the report on the Lushai expedition of 1888-89, and the report on the Chittagong column of the Chin-Lushai expedition in 1889-90, both of which were compiled in the Intelligence Branch of the Quartermaster-General's Department in India ; in the Political Report on the North Lushai Hills for the year 1890-91, printed in F.A. Progs., August 1891, Nos. 30—38 ; in the Report on the outbreak in 1892, printed in F.A. Progs., December 1892, Nos. 14—141 ; in a note recorded by Major Shakespear in 1905 ; and in the Administration Reports of the Lushai Hills district.

Mr. McCabe's political report on the North Lushai Hills for 1890-91.

The following opinions with regard to our relations with the Lushais have been left on record by Mr. McCabe, an officer of great experience of the tribes on the North-East Frontier.

We have had relations with the Lushai tribes since 1844, when Lalchokla raided on the Manipur colony of Kochabari in Par-tahghar and took 20 heads. From that time up to 1871 the districts of Sylhet and Cachar were repeatedly attacked and various measures were tried in order to facilitate the improvement of our relations with these tribes. Our policy had been an ever varying one, but it was finally decided in 1871-72 to maintain a chain of outposts along the frontier, and to send one of the Cachar officers to make annual visits to the hills and use his influence in adjusting inter-village disputes and in cultivating friendly relations with the leading chiefs. This may be described as more or less a policy of non-intervention, repudiating all desire of annexation, while at the same time attempting to thrust the thin edge of our influence into the councils of the Lushais.

The history of the North-East Frontier is pregnant with proof of the utter fallacy of the judgment prompting this line of action, and a consideration of the mental training of the savage tribes on these borders will clearly show in what light they regarded it. Every Lushai, Kuki, or Naga is brought up with the idea that rapine and bloodshed are meritorious acts, and that "he has right who has the might, and let him keep who can." Leniency, mercy, conciliation and a respect for the rights of property are all looked upon as signs of weakness, and are treated with contempt.

I quote an extract from a letter published in the *Observer* on the 25th February 1871 after Mr. Edgar's visit to the Western Lushais.

"Sukpial was invested with a dress of honour specially made for him,—green *pyjamas* with scarlet and gold flowers, a purple coat with green and gold embroidery, an indescribable hat of green and white silk, a necklace of glass buttons and gold beads and two glass ear-rings. One farewell tot of 'Edgars peculiar,' and the Sahib and the savage parted with mutual esteem. The policy of conciliation had reached its grand climacteric. But before the patient diplomatist had reached his bungalow in Silchar, messengers from the Lushai had proclaimed in Manipur that the Sahib had been into the hills to pay tribute to the chiefs, sure proof of their puissance and significant warning to their remaining foes. • • • What had Sukpial done to bring down on him such showers of good things? Simple question! He had raided with impunity and success. Nothing could be more congenial to their own habits and wishes. If Sukpial had slain his tens, they would slay scores. If he had butchered defenceless peasants, they would have heads of police, of sepoys, and of Sahibs."

The raids of 1871-72 on Ainerkhal, Alexandrapur, Katlichara, Maniarkhal, Nagdigram, Jhalnachara, and Kacharipara, may fairly be placed to the credit of the policy of conciliation.

To my mind there are only two possible lines of treating these and cognate tribes: one is absolute annexation, and the other total non-intervention. Half measures are futile, and those adopted must be "thorough," a conciliatory policy being useless, as it is always of a fluctuating nature, according to the special idiosyncracies of the officers deputed to enforce it. On the North-East Frontier both these systems can be used with advantage.

CHAPTER III. POPULATION.

Villages—Migration—Sex and marriage—Infirmities—Language—
Tribes—Religion—Occupations.

The statistics of population call for little comment. The Lushai Hills is a great expanse of jungle covered hills, with a sparse but homogeneous population. It is barely fifteen years since we occupied the country, and only one census has been taken of the district. The ethnographical matter, which figures so largely in census reports and gazetteers, will be found treated at length in the monograph on the Lushai tribe which is now under preparation by Major Shakespear, and need not be referred to here. The district covers an area of 7,227 square miles, the population in 1901 was 82,434, and the density was thus only 11 to the square mile. This indicates a sparseness of population which is phenomenal even in Assam, for the density of the district is only a third of that existing in the Naga, or the Khasi and Jaintia Hills.

There are no towns in the district, and in 1901 the **villages.** people were living in 239 villages, the great majority of which were small hamlets with less than 500 inhabitants.

Major Shakespear gives the following description of a Lushai village :—

“Villages are generally built on the top of a ridge or spur, and not on the slope of the hill, as is the custom among the Chins.

The cause of this, I think, is that the hills are higher in the country inhabited by the Chins, and therefore they can get healthy sites without going to the top of the ridges. In former days, the choice of the village site was much influenced by its defensive capabilities, the migratory habits of the people precluding their constructing the elaborate defensive works found round the Chin villages. When we first occupied the hills, every village was strongly stockaded, two and even three rows of stockades being found in some cases. The gateways were commanded by timber block houses, and at suitable points on the roads block houses were built which were occupied whenever there was any fear of attack. The ground round the stockades and block houses was planted with sharpened bamboo spikes, which formed a very serious obstacle to a barefooted foe.

"The villages are laid out in streets all radiating from some central open spot, facing which is the chief's house and the *sawlbuk* or guest-house. The houses are built on piles on the natural slope of the hills, and thus the floor of one house is often higher than the roof of the house below it.

"The houses are all constructed in the same manner and on the same plan. At the end nearest the road is a rough platform of logs which is the place for cleaning the *dhan* in. On the front wall of the house over this platform are hung the horns of any animals the owner of the house may have killed, and among them are the baskets in which the hens hatch out their broods. The doorway has a very high sill, and the door consists of a sliding panel of bamboo work. The fireplace consists of an earthen hearth, in which three upright stones are inserted to hold the cooking pot. Above this are two bamboo shelves on which articles which require drying are kept. On each side of the fireplace are bamboo sleeping platforms, that furthest from the door being for the father and mother, the other for the daughters. Beyond the family sleeping platform is a partition, the space between which and the end wall of the house is used as a lumber-room and closet, from this a back door opens out on to a small platform. The chief's house only differs in size, generally having two rooms, the one nearest the entrance being for the use of the slaves. Windows in the sides of the house are considered unlucky, unless the right to make one has been purchased by killing two metna and feasting the village. The houses are built of timber uprights, but the walls, floor, and roof frame are made of bamboo; the thatching material used is generally cane leaves, but occasionally grass is used. Over the cane leaves broad bands

of split bamboo are tied down from eave to eave, giving the roof a rounded appearance from the outside. A long coop under the eaves is the sleeping place of the fowls, who gain access to it by a ladder made of a knotted stick.

"The *zawlbuk* is a large hall, with a huge hearth in the centre and a sleeping platform at the far end. The front wall stops about three feet short of the ground, and to enter the building you have to stoop under this, and then climb over a barrier of equal height placed a few feet further in. This building is the sleeping place of the young men of the village, and of any strangers who stop there the night. It is also a sort of general meeting house. The boys of the village have to keep up a sufficient supply of firewood for the *zawlbuk* fire.

In the centre of one of the streets will generally be found the blacksmith's forge, a small house, built on the ground level, but with a platform in front of which passers-by can sit, and lighten the labours of the smith by their conversation. The bellows consist of two hollow logs in which pistons are worked up and down, from the lower extremity of each log a tube runs to a hole in a stone placed immediately behind the stone on which the charcoal fire rests. A very moderate movement of the pistons gives an excellent draught. The blacksmith repairs all the tools of the village, but some of them are capable of a good deal more than this.

There is very little to attract immigrants to the Lushai Hills, and 93 per cent of the persons enumerated there in 1901 had been born inside the boundaries of the district. A few hundred people had moved across the frontier from Manipur and the Chittagong Hill Tracts, but the bulk of the immigrants came from Nepal and were serving in or had been connected with the military police battalion. There is practically no emigration from the hills, except across the frontier of Manipur. Migration.

The proportion of women to men is very large, larger in fact than in any other district in the Province. In 1901 there were 1,113 females to every 1,000 males, the Sex and marriage.

corresponding figure for the Province as a whole being only 949. Amongst the Lushai tribes the proportion of the sexes was very nearly as 6 to 5. The cause of this surplus of women is not quite clear, but it is a phenomenon which is common to nearly all the animistic tribes, though not in quite so marked a degree. The early marriages that are so common amongst Muhammdans and Hindus tend to diminish the mean duration of female life, and from this disability the Lushais are fortunately free. In 1901 not one per cent of the married women in the district were less than 15 years of age.

The following account of the marriage customs of the Lushais is extracted from an account by Major Shakespear :—

→ “ Each clan has a regular fixed price for its girls, and any one wishing to marry a girl must pay this price sooner or later. The price varies from three metna to ten according to the clan. The price is always stated in metna, but the actual articles given or the amount paid in cash is subject to arrangement. The father or the nearest male relative on his side receives this price, but the bridegroom has also to pay many other persons. The girl's aunt will get a sum varying from Rs. 40 to Rs. 5, the elder sister gets a small sum for having carried the bride about when she was young. The bride appoints a male and female friend or protector, and each has to be paid a small amount by the bridegroom. The bride takes with her certain cloths and ornaments, but these remain the property of the girl's male relatives unless she has a child to inherit them, in which case an extra payment, varying according to the quality of the dowry, has to be paid. The nearest male relative on the bride's mother's side has also to be paid a sum varying from Rs. 40 to Rs. 4. These sums are never paid at once—in fact, many men never complete paying the price of their wives, and leave the debt to be cleared off by their children.

"A young Lushai generally chooses his own wife, and sends a Palai, or ambassador, to her parents to arrange the details of the price to be paid. These settled, the bride is escorted to her future husband's parents' house, by a party of friends, being pelted with dirt by all the children of the village. The parents of the bridegroom receive the party with brimming cups of rice-beer, and when justice has been done to this, a fowl is produced by the bridegroom and slain by the Puithiam or sorcerer, who mutters certain charms over it. Directly this is over, the bride and her girl friends retire, while the rest of the party indulge in a great feast, the bridegroom having to provide a fowl for each of those entitled to a share in the price of the bride. The following evening the bridegroom's mother goes and fetches the bride and hands her over to him at his house. The following morning the bride returns to her parents' house and spends the day there. This she continues to do for some time. The bonds of matrimony are very loose. If a couple do not get on they can separate by mutual consent, or if the husband does not like the woman he can simply send her back to her parents. In both these cases he does not recover any part of the price he may have paid, and the recipient of the price is bound to support the woman till she is married again. If the woman commits adultery, or leaves her husband without his consent, her relatives have to refund whatever they received on her account. A widow is at liberty either to return to her own people, in which case her late husband's relatives take all his property and his children, or she may continue to live in his house, in which case she retains his property in trust for his children, but should she indulge in an intrigue she is considered to be an adulteress, and her relatives have to pay back her price to her late husband's relations, who take all the property and also the children.

"Until a girl is married she may indulge in as many intrigues as she likes, but should she become pregnant her lover must pay a metna to her father; he will, however, be entitled to take the child when it is old enough to leave its mother. In case the child is a girl, the father of course gets the marriage price in due course. If a man is willing at once to marry a girl whom he has seduced he is not expected to pay more than the usual marriage price.

"All clans intermarry, the children taking the father's clan name. The marriage of first cousins is rare amongst the common people, chiefly because the parents of the girl prefer taking her price from some one outside their family circle. Among chiefs,

who are anxious to marry their children to the children of other chiefs, the marriage of first cousins is more common. Except his mother, sisters, daughters and aunts, a man may marry any woman he likes."

Infirmities. The abstract in the margin shows out of 10,000 males the number in the Lushai Hills, Assam,

	Insanc.	Deaf-mutes.	Blind.	Lepers.	
Lushai Hills ...	29	16	19	1	and the Indian Empire,
Assam ...	5	9	10	13	afflicted in 1901 with
Indian Empire,	3	6	12	5	

the four special infirmities selected for record at the census. Insanity is extraordinarily prevalent—why it is difficult to say, as the Lushais do not take intoxicating drugs and the marriage of near relations is said to be unusual. Whatever the cause may be, it is probably also responsible for the large percentage of deaf-mutes. Blindness is always common in the hills, where the smoke and dirt in the hillman's house must tend to produce ophthalmia.

Language. Lushai or Dulien, which belongs to the Kuki-Lushai group of languages, is the *lingua franca* of the district. It is described by Dr. Grierson in the Linguistic Survey of India, Vol. III, Part III, page 130. Messrs. Lorrain and Savidge have written a grammar and compiled a dictionary of the language. Other languages or dialects belonging to the Kuki-Chin group which are spoken in the hills are Zahao, Lakher, Mhar, Paite, Ralte and Ngente. Major Shakespear is, however, of opinion that these variants from the main stock will be gradually absorbed and that Dulien will become the language of the district.

The indigenous inhabitants of the district are, **Tribes.** according to Major Shakespear, all of one race. The great majority of them are Lushais or Duliens, but there are also a considerable number of Pois, or immigrants from the Chin Hills, and Hmar, a tribe which was driven out of the district into Manipur, but is now gradually returning to its former haunts. The people are divided into a number of different clans, who are differentiated from one another by distinctions in their sacrificial ritual. The Ralte, Paite, Thado, and Lakher are easily distinguishable, but many of the remaining clans can hardly be distinguished from the Lushais, and such differences as exist are disappearing every year. For information with regard to the organization, and manners and customs, of the different tribes, reference should be made to the monograph now under preparation by Major Shakespear.

Ninety-five per cent of the population of the district **Religion.** are still faithful to the religion of their forefathers, of which the following account is given by Major Shakespear.*

“The Lushais and all other tribes in the hills believe in a supreme being who made the world : he is known as Pathian, but is not thought to take much interest in the doings of people. Far more important to the average man are the numerous Ramhuai or demons who are supposed to inhabit every hill and stream, and Khuavang, a spirit sometimes spoken of as the same as Pathian, but generally considered as less powerful, but more concerned with mankind. Every illness, every failure of crops is put down either to the influence of some demon or of Khuavang, and the whole of

* Report on the Census of Assam in 1901, page 148.

a hillman's existence is spent in propitiating these spirits. The Puithiam, or sorcerer, is supposed to know what particular spirit is the cause of the trouble, and what particular sacrifice will appease him. The number of these sacrifices, and the different ways in which they have to be performed, would fill a thick book. In all of them the flesh of the animal killed is eaten by the sorcerer and his assistants, the least toothsome portions only being left for the demon. Small figures representing human beings and animals are also offered to the demons. Besides these sacrifices, there is a special sacrifice to the patron spirit of the hearth. This can only be performed by a member of the clan, and the method of performing it varies in every clan.

"The most generally accepted theory as to what happens after death is that the spirits go to 'Mit-thi-khua,' but that those men who have slain men or animals in the chase or have feasted the village are able to cross the Pail river to an abode of great comfort, where there is plenty of food and drink to be got without any work. As women cannot go to war nor kill wild animals, and are not allowed to give feasts, they can only reach this happy land if their husbands take them. Existence in "Mit-thi-khua" is full of trouble and worry.* After a certain period in one of these two abodes of departed spirits, the spirit is again born as a hornet, and after a time assumes the form of water, and if in the form of dew it falls on a man it is re-born in his child."

Details for other religions will be found in Table II. The pioneer missionaries, Messrs. Lorrain and Savidge, commenced work at Aijal in 1894, but were obliged to leave the district in 1897. Their work was carried on by the Welsh Calvinistic Mission, and as the two pioneer missionaries returned in 1903, there were altogether in 1905 four missionaries working in the district. Christianity has not, however, as yet had time to make much progress, and in 1901 there were only 26 natives who professed that faith.

* The Lushais think that Mit-thi-khua is situated in the Ri lake in the Chin Hills,

The occupations of the indigenous inhabitants of the hills begin and end with agriculture, and are of no interest from the statistical point of view. Agriculture was returned as the means of livelihood of nearly $93\frac{1}{2}$ per cent of the population in 1901. The remainder were foreigners, the great bulk of whom were in Government service. Only 167 people were said to be supported by trade.

CHAPTER IV. AGRICULTURE AND CONDITION OF PEOPLE.

Agriculture—Live stock—Forests—Arts and industries—Food and dress—Condition of the people—Communications—Trade.

Agriculture. The system of agriculture is described as follows by Major Shakespear :—

In February the Lushais begin to select the sites of their cultivation. These are called *jhums*. The chief has first choice, and after him the *Ramhual*, or councillors of the chief, and then the rest of the people. Each of the *Ramhual* pays the chief from three to five baskets of rice for the land he occupies, whereas only one basket per house is demanded from the ordinary villager. Having chosen the site for his *jhum*, the Lushai has to clear it, a work of great labour, as the only tools available are his dao, a chisel-edged knife about 15 inches long, and a small axe with a head weighing about $1\frac{1}{2}$ pounds. The thicker the jungle the better the crop is a Lushai maxim. In tree jungle all the undergrowth and as many of the trees as possible are felled, those that are too big for felling are cleared of their branches. In parts where the jungle is bamboo the work is comparatively light, but the crop is not generally so good; on the other hand bamboo land can be cultivated every four or five years without the bamboos being exterminated, so that if a chief has two village sites some miles apart he can move backwards and forwards from one to the other all his life time. Tree jungle, if continually felled and burned, gives place to coarse grass, and the land, according to Lushai ideas, is then useless for cultivation, for they consider the manuring of the ground by the burning of a heavy mass of felled jungle to be absolutely necessary. By the middle or end of March the felling is over, and the hot April sun effectually dries the wood ready for the firing of the *jhums* in May. During this month the sky is hidden by dense clouds of smoke, miles of hillside often being ablaze, the fire having spread from the *jhums* to the jungle. Any charred trunks which remain are dragged to the edge of the *jhum*, and built into a close fence, for rats, jungle fowl, pheasant,

deer, &c., would leave the poor Lushai but little of his crop if he did not take this precaution. Openings are left in the fence every now and then in which snares are set to catch unwary intruders. In spite of the utmost care, however, they often lose heavily from the onslaughts of these pests.

About the end of May the whole family turns out to sow the seed, a line is formed at the lower edge of the clearing, and the party moves steadily upwards, scratching holes with their broad-bladed knives, and dropping a few seeds into each. Seeds of various sorts are occasionally sown in the same holes, and each comes up in turn. Rice is the chief crop, but melons, maize, pumpkins, millet, peas, beans, cotton and tobacco are also grown. The maize ripens first and is eagerly expected by the improvident Lushais, who are generally hard up for food, having used more rice than was wise in the manufacture of beer. If a village has had bad crops, the people at once begin moving to some village where food is more plentiful, or the adults set off in large parties to buy rice wherever it is to be had.

The live stock include tame mithun or bison (*bos* Live stock. *frontalis*), pigs, goats and dogs. The pigs are carefully tended, and treated almost as pets ; the goats are of the long-haired hill breed. Dogs are used as articles of food, and are said to be similar to those eaten by the Chinese. They are of medium size, with long yellow hair, short legs, a bushy and tightly curled tail, and a pointed nose, and are in great requisition for sacrificial purposes.

A portion of the Inner Line Reserve of the Cachar Forests. district falls within the borders of the Lushai Hills. The whole of this reserve is, however, managed from Cachar, and there are no details available with regard to the part which is actually situated in Lushai land. A considerable portion of the district is still covered with tree forest. A list of the principal trees will be found in Chapter I.

Arts and industries.

The arts and industries of the hills are naturally not of much importance. The women weave excellent cloths from their home grown cotton, and the men are clever enough at making baskets. Earthen pots and pipes are also manufactured, and the blacksmiths are more skilful than is usual in Assam. Very good moulding in brass is occasionally to be met with, and some of the smiths are able to manufacture gun locks.

Food and dress.

The staple food of the people is rice, but they will eat almost anything that they can get except rhinoceros and the hooluk monkey. They are not particular either, as to the state of putrefaction that their meat has reached. Milk, like the other hill tribes of Assam, they eschew. When a feast is given in a village the meat is boiled in huge earthen pots, and spread out on mats and plantain leaves. The guests then eat their meat without condiments, and wash it down with draughts of the water in which it was boiled. After they have finished the first course they retire to their houses and eat great quantities of rice. Beer made of fermented rice is the national drink, and is not unfrequently taken to excess. Both sexes smoke continuously. The men use pipes with bamboo bowls and a long straight stem, the women's pipes have bowls of clay and are constructed on the principle of the *huka*. The water impregnated with nicotine is carefully preserved, and each man carries a small gourd full of it. From time to time he sips a mouthful, keeps it in his mouth for a few minutes, and ejects it. It is said to act as a kind of stimulant.

Men wear a single cloth about seven feet long and five feet wide, wrapped round the body in such a way as to leave the right arm bare. Women wear a short dark blue petticoat, kept up by a brass girdle, and reaching nearly to the knee, and a short white cotton jacket. In the winter they add a cotton wrap, while the men wear cotton jackets under their shawls. Amongst the Pois and the Fanais the men wear their hair in a knot above their foreheads like the Daflas and Miris in Assam. The men of the other tribes fasten it in a knot at the nape of the neck and make all secure with ivory combs and large pins of brass or other metal. Women generally twist their hair into a knot at the back of the head. Both sexes wear amber and bead necklaces, when they can afford them, and ear-rings. The ear-rings of the women are discs of baked clay or ivory often two inches in diameter, which are fixed into the lobe of the ear and distend it in the most unsightly manner. The arms of the men are guns, spears, and daos. The guns are flint-locks, mostly old tower muskets. The stocks are carved and ornamented with patterns of red or black lacquer. Mithun horns serve as powder flasks, and are also adorned with patterns of red and black. Spears are not valued much as weapons of offence : the fighting dao is a modification of the Burmese dao and is known as *kawlnam* or Burmese dao.

Judged by their own low standards the hillmen are extremely comfortably off. The Lushais are a migratory people, and, as they have to transport all their possessions every fifth year or so to a new village, they

Condition of
the people.

have little inducement to accumulate much property. The people themselves produce all that they require, and it is said that in South Lushai the Lushais have more money than they know how to spend. The district is sparsely peopled, the *jhums* yield abundantly, and there is still plenty of jungle to give cover to the game. Porters and coolies employed on road-work receive the liberal wage of eight annas per diem. These persons have, however, to be impressed, as the Lushais are too prosperous to voluntarily undertake hard work, even for such a liberal wage as eight annas a day. Famine seldom occurs, but, in 1881, there was a scarcity in the hills due to the ravages of innumerable swarms of rats. In the previous season, the bamboos had seeded, and the supply of food thus provided caused an enormous increase in the number of these rodents, who, when they had exhausted the bamboo seed, devoured the rice crop. The Lushais descended to the Surma Valley, not to raid but in search of work and food, and Government sent about 750 tons of rice and paddy into the hills.

**Communica-
tions.**

Prior to our advent the only means of communication in the district were the Lushai paths and the rivers, and both alike were bad. At the present day there are bridle paths to most places of importance in the hills. Aijal is connected with the Cachar district by the Dhayar band path, by which it is $89\frac{1}{2}$ miles to the Cachar frontier and 120 miles to Silchar. There are rest-houses at the following places starting from Aijal: the figure in brackets represents the length of the stage:—Neiboi (11 miles), Taito (16 miles), Bolpui ($12\frac{1}{2}$ miles), Kolosib

(15 miles), Kukimara ($15\frac{3}{4}$ miles), Rengti (12 miles), Kanglai in Cachar ($9\frac{1}{2}$ miles). For travellers from Aijal to Cachar, it is, however, quicker to go to Sairang ($12\frac{1}{2}$ miles) and then boat down the Dhaleswari to Salchapra, a journey which can be performed in three or four days in the cold weather and two days in the rains. Another path runs from Aijal to Falam, the total distance to the place where it crosses the Tiao river being 106 miles. There are inspection bungalows at the following places :—Sonai (11 miles), Sakeilui ($13\frac{7}{8}$ miles), Saitual ($13\frac{3}{8}$ miles), Dulte (14 miles), Tuishen ($11\frac{1}{4}$ miles), Neidawn ($14\frac{3}{4}$ miles), Champhai ($12\frac{1}{2}$ miles). South of the Falam path there is a path to North Vanlaiphai, the total length of which is 91 miles. The following are the stages on this path :—Paikhai (11 miles), Zobawk (14 miles), Chinchip (11 miles), Chiatlang (14 miles), Keithumkawn ($13\frac{1}{2}$ miles), Checkawn ($15\frac{1}{2}$ miles), North Vanlaiphai (12 miles). From Keithumkawn a path runs to the Koladyne on the Lungleh-Haka road. West of this path runs the Aijal-Lungleh road almost due south from Aijal to Lungleh, a total distance of 107 miles. The inspection bungalows are located at the following places :—Sibutalang ($13\frac{3}{4}$ miles), Thiak (13 miles), Sialsuk ($13\frac{3}{4}$ miles), Thenzawl ($13\frac{1}{2}$ miles), Ramlai Tui (14 miles), Howlong (14 miles), Shaja ($12\frac{3}{4}$ miles), and Lungleh ($11\frac{1}{4}$ miles). From Lungleh a path runs to Demagiri (42 miles), and to the upper Koladyne river. The stages on the former are Ridge Camp ($10\frac{1}{2}$ miles), Lungsin ($13\frac{1}{2}$ miles), Tuichong (10 miles), and Demagiri (8 miles). On the latter Zobawk ($11\frac{1}{2}$ miles),

Leithe ($13\frac{1}{4}$ miles), Darjow ($11\frac{1}{4}$ miles), and South Vanlaiphai (10 miles). From Demagiri there is a path to Thega (6 miles), and a cart-road $2\frac{1}{2}$ miles in length to the Karnaphuli river. There are five permanent bridges in the district and three ferries. Temporary bridges of bamboo, timber, and cane have been erected in other places. The Dhaleswari and the Karnaphuli are the only rivers in the hills that are used as routes for traffic. Boats of forty maunds burthen can proceed up the former river as far as Sairang even in the cold weather. The passage upstream is, however, very slow. In the cold weather a boat with a load of forty maunds generally takes three weeks for the journey from Silchar to Sairang, and in the rains the voyage is often twice as long. At that season of the year it generally takes a boat a week to negotiate the $6\frac{3}{4}$ miles of roaring torrent that separates Changsil from Sairang. A boat carrying ten maunds or so can, however, do the voyage from Salchapra to Sairang in ten days in the cold weather and in about sixteen to twenty in the rains.

Trade.

There is no trade of any importance amongst the Lushais. A certain amount of wax is sold to the shopkeepers, and itinerant dealers from Burma, Manipur, and the Naga Hills peddle gongs and beads amongst the villages. Forest produce is exported from the district, but the business is in the hands of plainsmen who send their sawyers into the hills. The only villages in the hills in which there are shops are Aijal, Demagiri, Sairang and Lungleh. In Aijal there are seventeen

shops, at Lungleh there are two, and at Demagiri eight. Salt, cloths, brass pots, umbrellas, and ornaments are the articles which command the largest sale amongst the Lushais.

CHAPTER V.

GENERAL ADMINISTRATION.

Land revenue—Government—Constitution of Society—Criminal and Civil Justice—Garrison—Education—Medical aspects.

**Land
revenue.**

Land revenue is only assessed on the holdings of the missionaries at Lungleh and Aijal, and on the shopkeepers. The former pay at the rate of one rupee an acre, the latter at the rate of four annas a *katha* or one anna per running foot of frontage. The only tax paid by the Lushais is a tax of Rs. 2 per house, and even this is remitted in cases, though such cases are rare, of genuine poverty. The Lushais follow the system of *jhum* or fluctuating cultivation, but where possible, a definite tract of land, lying within clearly defined natural boundaries, has been assigned to each chief. Within these boundaries he can wander at will, without running the risk of encroaching on the land of neighbouring villages. Excise is not a question of any importance in the hills. No attempt is made to tax rice-beer, and the Lushais do not take intoxicating drugs or country spirit. Only one license is issued in the district, and that is for the sale of ganja at Aijal. Income-tax is only deducted from the salaries of Government servants. No revenue is realized in the hills either from judicial or non-judicial stamps, except in the case of civil suits instituted by foreigners.

Government.

For administrative purposes the district is divided into two subdivisions, Aijal and Lungleh. Aijal is in

the charge of the Superintendent of the district who is allowed one Assistant Superintendent of Police as his immediate assistant. Two Assistant Superintendents of Police are sanctioned for Lungleh. For the purposes of internal administration the district is divided into eighteen circles, twelve in the Aijal and six in the Lungleh subdivision. Each of these circles is placed in charge of an interpreter, who lives at some central spot. Orders issued by the Superintendent are transmitted to this man for communication to the chiefs. He is also required to submit every fortnight a report on the state of the crops, and the general condition of affairs within his circle. Society is, however, organized on the aristocratic basis, and in all minor matters the people are subject to their chiefs.

Major Shakespear gives the following account of the relations existing between a chief and his people:—

**Constitution
of society.**

The people live in villages, each of which is ruled by a chief, who is entirely independent. Even a young son will not admit his father's right to influence him, after he has once established a separate village. The chief is supreme in his own village, but the people are very democratic, and have a very easy remedy if a chief oppresses them, *viz.*, to remove to another village. The chief settles all disputes in the village, arranges where the *jhums* are to be, and when and where a village is to move. His house is the poor-house of the village, and all orphans and others who have no means of support are received there, and get food in return for their labour. Formerly, a person who had committed some serious crime could enter the chief's house and thus escape vengeance.

When a child has been brought up in the chief's house, it is in some respects a slave. Girls are released on marriage, but the chief receives the marriage price. Boys have to buy their release at the cost of a metna. A chief sometimes buys a wife for a favourite slave, and sets him up in a separate house, and three years

after the man will be considered free, but his children are sometimes considered slaves. The chief's slaves are very well off, they wear the chief's ornaments and eat the best food to be got, and do no more work than they would have to do if they were not slaves.

The chief has several advisers who are called *Upa* or *Ramhuan*¹. They have the first choice of *jhum* land, and sometimes the chief allows them to get a basket of rice from each house. The other village officials are the crier, who goes round the village after dark, shouting out the chief's orders, the blacksmith, and the *Puithian*, or sorcerer, who performs sacrifices in case of illness. These persons generally receive a donation of rice from each house in return for their services.

The chief receives from one to five baskets of rice according to the quality of the *jhum* land assigned to the cultivators; he also receives a hindquarter of every animal killed in the chase, besides some other small dues.

There is a regular code of punishments for different offences, the chief of course receiving a share of every fine levied.

**Criminal and
Civil Justice.**

The High Court has no jurisdiction in the hills, except in criminal cases in which European British subjects are concerned. The Superintendent exercises the powers of life and death, and can impose sentences of imprisonment up to the maximum amount provided for the offence. The death penalty or sentences of imprisonment for seven years and upwards require, however, the confirmation of the Local Government. Appeals lie to the Superintendent from the decisions of his assistants, who are invested with such powers, not exceeding the powers of a Magistrate of the first class, as the Lieutenant-Governor thinks fit. The rules for the administration of justice in the district will be found in the Supplement to the Manual of Local Rules and Orders, page 14. Litigation is discouraged and judicial work is light. Details will be found in Table V.

The garrison of the district is furnished by a battalion **Garrison.** of military police with headquarters at Aijal. The men are armed with Martini-Henry rifles, mark IV, bayonets and kukris. The strength both of the military and civil police with the outposts held by them will be found in Table VII. There is a small subsidiary jail at Aijal with accommodation for 13 prisoners. The average daily population in 1904 was only 4.

The Lushais seem to appreciate the advantages of edu- **Education.** cation more keenly than any of the hill tribes in Assam, except, perhaps, the Khasis. In 1901, no less than 25 per mille of the male Lushai population knew how to read and write. Some of them acquired this knowledge to enable them to assist in carrying out the census. In villages in which there was no one qualified to act as enumerator, a young man was selected and sent to Aijal, where he was taught how to read and write and instructed in the rules. Education is largely in the hands of the Welsh Calvinistic Mission at Aijal, and of the American Baptists at Lungleh. In Aijal the missionaries maintain an Upper Primary School in which Lushais are trained to act as village school masters. Instruction is given in the Lushai language, in books printed in Roman character, as Lushai has no character of its own. The village schools are situated at Aijal, Phulpui, Maite, Lungtan, Khuangleng, Mutthi, Zuktual, Hmunpui, Biate, Khandai, Maubawk, Khawlian and Rasiveng in the Aijal subdivision and at Serkawn, Khongbok (Jadala's), Khongbok (Lalluova's), Ngarchip

and Sethlun. The number of scholars will be found in Table VIII.

With the object of providing Lushais who have mastered the art of reading with something that they can read, a magazine is published once a month. Technical education also is not neglected, and Lushai boys are trained in the workshops of the Public Works Department.

Medical aspects.

Attempts have recently been made to record vital statistics in the hills, but as yet the returns cannot be said to possess very much value. Epidemics seldom occur, and fever is, doubtless, the most deadly lethal agent in the district. There are dispensaries at Aijal, Sairang, Tenzol, Kolosib, Lungleh, Balpui and Demagiri. At all of these places except Balpui there is accommodation for in-door patients. Worms, malarial fevers, ulcers, and diseases of the skin, diseases of the respiratory system, and rheumatic affections, are the ailments for which treatment is most frequently applied. Out-patients are also treated at the military police hospitals. The Lushais are said to have some faith in European medicines and they attend willingly at the hospitals, but they do not care for vaccination. They have never suffered from small-pox, and so do not appreciate the advantages of a prophylactic.
